The chief towns (with their pop. in 1832) are—Marseille (121,127 inh. in the town, 145,115 in the whole commune), on the sea; Aix (15,916 inh. in the town, 22,575 in the whole commune); Arles (14,644 inh. in the town, 29,236 in the whole commune), Tarascon (9,925 inh. in the town, 10,967 in the whole commune), on the Rhône opposite Beaucaire; Martigues (5,893 in the town, or 7,373 in the whole commune), on the channel communicating between the sea and the Etang de Berre; La Ciotat (4,034 inh. in the town, 6,549 in the whole commune), on the sea S.E. of Marseille; Salon (1,817 inh. in the town, or 1,978 in the whole commune), upon that branch of the canal of Craponne which branches off to Istres; Aubagne (3,925 inh. in the town, or 6,349 in the whole commune), on the river Verne; and St. Remi (3,135 inh. in the town, or 5,464 in the whole commune), on the canal de la Réal.

The population returns for 1832 give the following communes as containing above 2000 and under 5000 inhabitants:

This department has produced several eminent men. Petruwius Arbiter, a Latin writer of some note; Adanson, the naturalist; and others, are natives of the dep. Among the persons of note from the dep. are: Massillon, one of the chief orators of the French pulpit: Notrastinus: Vanlo, the painter; Tournemire, the botanist and traveller, &c.

BOUPLERS, LOUIS-FRANCOIS DUC DE, descended from one of the most ancient and noble families in Picardy, the second son of François II, count of Boupliers and Cagni, was born January 10, 1644. He entered the royal guards as a cornet in 1663, during which year he was present at the siege of Marsal in Lorraine. In the following campaign he was engaged in an expedition to Gergi in Africa; and so much talent did he afterwards exhibit in his service that he was sent to command the colony of Lausun in the winter of 1673. Having passed the winter in Germany, he joined him in the town of Einsheim in 1674, and received the thanks of Turenne for having greatly contributed to the success of that day. In the memorable retreat after the death of Turenne, in 1675, he commanded the French rear; and from that time till the battle of Blenheim was employed on active service. He then commanded in Dauphiné and the frontiers of Spain. His gallantry at the siege of Luxemburg was rewarded with the government of that city and province in 1688; and the seasonable detachment of a corps from the army of the Moselle, which he commanded in 1690, decided the event of the battle of Fleury-d'Ambert. In 1698 he was again wounded in an attack upon a hornwork at Mons; but during the remainder of that campaign he triumphantly kept the field against the allies, who were more than threefold his number, and continued the blockade of Lingen and of Hanover. On his return to court during the winter, he was personally invested by the king with the collars of the several orders into which he had hitherto been admitted only by proxy. When William III. moved his quarters from Boulogne to Paris in 1698, he accompanied him. He then partook of the glories of Steenkerken. In 1699 he was elevated to the dignity of marquis of France, and received the new order of St. Louis. He defended Namur against the allies, commanded by William III., for sixty-six days of operations, in 1699, and was again rewarded four general assizes. After its capitulation, he was detained a prisoner of war for a fortnight; and the king, in recompense for his great services, erected the county of Cagni and some adjoining domains in Beauvaisis into the dukedom of Boupliers. In 1706 he represented the king in the congress at Rastadt, for a projected invasion of England in support of John VI., which was not put in execution. In the war of the Spanish succession, he commanded in the Netherlands; and on June 31, 1703, in conjunction with the Marquis de Bethuner, he obtained a signal advantage over the Dutch at Eckeren, for which he received from the king of Spain the sword of the Golden Fleece. In 1708, after the battle of Oudenarde, he undertook to defend Lille against Prince-Eugene; and he maintained the town from August 12th till October 25th, when he capitulated, after having repeatedly detracted the English and the Dutch from his encampment and kept them from the city into which he retired held out till the 11th December following. The king loaded him with new honours for the brilliant defence, and made his duchy into a peerage. His presence in the battle of Blenheim, in 1709, and victory over the French army of the Duke of St. Remi, at Puyla, and a turnament which had arisen on account of scarcity of bread; after which, hastening to Flanders, he tendered his services to the marquis Villars, an officer junior to him, and brought off the right wing of his army in good order, losing neither a single soldier or prisoners at the disastrous battle of Malplaquet. This was his last public act; he died at Fontainebleau, March 32, 1711, in the sixty-eighth year of his age, and was buried with great military splendour in the church of St. Louis de Lille. The above sketch of the exploits of this distinguished captain is necessarily very incomplete; his history, in truth, forms the military history of the half century during which he served, and its details must be sought in the general history of France. Many of the anecdotes which have been related about him are greatly to his honour. Prince Eugene congratulated him upon the glory which he had acquired in defending Lille, as far superior to that accruing to himself by its capture; and it was remarked that horse-flesh was the only food served during the siege, guisant at a time when it was innumerable for its cheapness. So magnificent were the banquets with which Boupliers regaled his officers, while he held the command of a mimic camp formed by the king at Compiegne, for the instruction and amusement of the Grande Army, that it was observed that the young prince must decline all competition, and remain content to be a guest. The detention of
Boufflers after the surrender of Namur was a breach of the articles of capitulation, and was defended as a reprisal for similar violence which had been offered to the garrisons of Dixmuiden and of Deinze. When Boufflers justly remarked that in that case not the commander, but the garrison ought to have been concerned, he was answered by that power, which, though he had not uncharged compliment, that his single person was esteemed equivalent to 10,000 men. We do not recollect a more true appreciation of feminine grace than is exhibited by a repartee ascribed to the duke of Orleans; and perhaps when young lady of the day, a coxcomb asked, A-\textit{telle de l'esprit} \& was left mute by the veteran's ready answer, 

\textit{Comme une rose.}

BOUGAINVILLE, JEAN PIERRE, was born at Paris December 17, 1722, and during his short career distinguished himself by the public services now forgotten; among them was a French translation of the \textit{Anti-Lucr\textit{etius}} of Cardinal Polignac, and a Parallel between the expedition of Koul Khan and that of Alexander. Some poems, among which is the germ of Pope's \textit{Universal Prayer}, and several papers in the \textit{M\textit{\textit{emoires de l'Academy}}, also were printed by him. He held numerous employments of high literary distinction, as secretary to the Inscriptions, censor royal, keeper of the antiques in the Louvre, and secretary in ordinary to the Duke of Orleans, &c. He died at Locbes Jan. 2, 1762.

His younger brother, LOUIS ANTOINE DE BOUGAINVILLE, who more than doubled his years, led also a much more active existence. He was born at Paris November 11th, 1729, and studied in the university of the same city, where he was encumbered with the duties of proselytizing. Much of his time had been devoted to mathematics, and instead of commencing as an advocate at the Palais, he surprised his friends by enrolling himself in the Mousquetonniers, and by publishing a treatise on the geometrical calculus, with five plates. We know not in what manner he passed from military to diplomatic pursuits, but we afterwards find him employed as secretary of embassy in London, where he was elected fellow of the Royal Society. Returning to the army, he served in China, where he distinguished himself till 1758, when, as governor of the Island of Cavite, he planted the colony of Manila, and opened the way to the conquest of the Philippines. In 1759 he was engaged in the expedition against the English settlements in the East Indies. He was at once a general and a minister, and was placed at the head of the British East India Company. He became president of the council of India, and was appointed governor-general of the East Indies, with the title of admiral, and was appointed governor of the islands of the East Indies, and was placed at the head of the British East India Company. He became president of the council of India, and was appointed governor-general of the East Indies, with the title of admiral, and was appointed governor of the islands of the East Indies, and was placed at the head of the British East India Company.

Boigniville was in active promotion of the settlement. The Spaniards however were not willing that the French should invade their imaginary right of sovereignty in the western hemisphere; and the French government also speedily discovered that the mere possession of a rocky domain, which did not yield any return, and which deprives the country of the fruits of its soil, is no means worth the hazard of war. They gave orders therefore for the surrender of the settlement, and Bougainville was employed to undo his own work. The position which he had chosen for the establishment was at Port Louis, which stood on the east side of the bay of the large Islands, on a part of the coast which afforded a good harbour; and he was sanguine in his expectations that the new colony would in a great degree indemnify his country for the loss of the Canadas. The Parisian cabinet however thought otherwise; and in 1762 they bartered for the surrender of Port Louis to the Spaniards, who gave it the less swallow but perhaps more appropriate name of Port Solidad.

Bougainville was instructed to execute the transfer, and his commission authorized him afterwards to traverse the South Sea to the north extremity, to explore the islands of the Sandwich group, and to return home by the East Indies. For this circumnavigation of the globe, a frigates, \textit{La Boudeuse}, carrying twenty-six twelve pounders, and a store ship, \textit{L'Ilede}, were provided. His crew consisted of eleven commissioned officers, three volunteers, and 200 men; and the Prince of Nassau Sieghein obtained permission to accompany him. His voyage, although not to be compared in interest to that of Cook or Anson, is still a matter of importance, and was translated into English by Forster in 1772, and an abridgment of it is given in the appendix to the thirteenth volume of \textit{Kerr's General Collection of Voyages and Travels}.

Bougainville sailed from Nantes November 13th, 1766. On the 11th of January he discovered the Falkland Islands to some Spanish frigates which had been dispatched for the purpose, and he was then delayed till November at Monte Video by the non-arrival and the necessary repairs of his store-ship. In working off the shores of Tierra del Fuego he suffered much from boisterous weather. What little intercourse he established with the Patagonians was amicable; and he confirms the general opinion of their ugliness. What a strange story he has of his men. He seems to have exposed himself to scarcely less peril than he had undergone at sea. At parting he carried with him as a volunteer Atoorou, the son of a native chief. The youth's talents appear unhappily to have been very slender, but his marksmanship, though he was a civilized man in Paris. Even that little was of no advantage to his countrymen, for he died on his homeward passage in 1770. Almost the only circumstance demanding notice in the remainder of Bougainville's voyage was the discovery that one of his crew, named Baré, was a woman. She had always behaved with the most scrupulous modesty, was neither ugly nor handsome, and not more than twenty-six or twenty-seven years of age.

Scoury and a failure of provisions occasioned very severe suffering during the latter part of this voyage, till on September 26th, Bougainville, having been at sea for ten months and a half, cast anchor off Batavia, which miserable station was not inaptly named by Atoorou in his native language, \textit{Eenoua Male}, 'the land which kills.' At the Isle of France he published a treatise on the subject of the whale which was no longer necessary, and on March 16th he entered St. Malo, having been engaged upon his expedition two years and four months.

Bougainville commanded a ship of war during the American revolutionary contest. In 1785 he was the advanced age of eighty-two years on August 31st, 1811.

BOUGAINVILLE ISLAND. [NEW GEORGIA ARCHIPELAGO.]

BOUGUER, PIERRE, was born at Croise, in Basses-Bretagne, February 16, 1698. The father was professor of mathematics in the seminary of St. Omer. He was placed under the instruction of his father in mathematics, and making considerable progress by himself, taught first at Croise, and afterwards at Hâvre-de-Grâce. In 1727 he gained the prize of the Academy of Sciences for a memoir on the method of inscribing ships; in 1729, for one on the method of observing the stars at sea and on astronomical refractions, his formula and results being the same as those afterwards given by Simpson, but more complicated in form; in 1731, for a method of observing the dip of the compass at sea. In 1732 he was presented to the office of astronomer of the French navy, and in the same year, he was commissioned to accompany Bougainville in his expedition, together with two Spanish commissioners, to proceed to Peru, for the purpose of measuring a degree of the meridian. Thither he accordingly departed in May, 1735, and remained till 1743. The most essential parts of the operation necessarily fell upon him, and he performed them comparatively new to the subject. This important operation, which is one of the best of its kind, was carried on under difficulties as great as were ever encountered by any scientific expedition. The inhabitants of the country were either French commissioners, or supposes them either to be heretics or sorcerers, or to have come in search of new gold mines. Even persons attached to the administration employed themselves in stirring up the minds of the people, and when at last they had procured the assassination of the commissioners, they procured the consequences by procuring a verdict of lunacy against himself, and another by taking orders. The country itself
was difficult and dangerous: and this obstacle was increased by jealousies which arose between the French and Spanish commissioners, as well as between Bouguer and La Condamine. For a time it was feared that the success of the expedition, suspected that the latter would appropriate an undue share of the merit to himself. The consequence was, however, of no harm to the real objects of the expedition, but perhaps rather the contrary; for it caused Bouguer to make a more careful preparation than he would otherwise have done; and Antonio de Ulloa to conduct their operations separately, while the near accordance of the three in their results was a favourable presumpion for their accuracy. The results did not differ from their average by a five-thousandth part of the whole, in the length of a degree, in their meridian.

The leisure which impediments occasionally gave enabled Bouguer to apply himself to the determination of points not immediately connected with the main object. Among other things, he ascertained the amount of refraction at considerable heights above the horizon. He found reason to suspect the effect of the attraction of Chimbampa upon the plumb-line, but not knowing the mean density of the mountain, could not perform the task which Maskelyne afterwards undertook. [Attraction.] A part of the observations (on the obliquity of the ecliptic) were forwarded as soon as made to Halley, who published them in 1739 in England: but an account of the whole was published in Paris, in 1740, under the title of 'Figure de la terre,' &c. In 1752 followed a justificatory tract on several disputed points, which was hailed as a hero of science, and published, in part, by Lacaille in 1769, and reprinted in 1781 and in 1792, with notes by Lalande. In 1754 Bouguer published an attack on La Condamine, relative to the part of the great survey claimed by both. The latter replied with temper; and the dispute was waged (in an observation both of Condorcet and Biot), he carried the public with him. It seems to be admitted on all sides, that Bouguer had no ground of offence whatsoever, and that La Condamine behaved towards him with great respect and moderation.

Bouguer was afterwards employed to verify the degree measured by Dominico Cassini between Paris and Amiens. This he did in conjunction with Cassini de Thury, Camus, and Pingré. The results were published in 1757. He died August 10, 1762, of an inflammation on the gradual extinction of light, which was afterwards completed and published by Lacaille in 1760. In this work he mentions an invention of his in 1748, which he calls the heliometer, and which is in fact the first double object glass microscope. In 1756 it is thought, of Dufay, that he invented the double glass, which is the more easily used, and is esteemed the better instrument, was invented independently a few years afterwards, and consists in an object-glass divided into two halves. [Micromet. Bouguer attacks the Royal Society of London for their non-acceptance of the proceeding mentioned in the life of Auzout, and had published (but not till after Bouguer's discovery had been made known) the prior invention of an Englishman named Savery. He reminds them of the circumstances to which we have just referred, and, as Dalambrequ remarks, having a better case than against La Condamine, he is more moderate in his language.

As a scientific character, Bouguer must stand in the first rank of utility. The operations in Peru are among the first of his observations, one of the most difficult kind of scientific investigations.

BOUHOURS, DOMINIQUE, was born at Paris, 1629. He studied at the college of Clermont, professed with the Jesuits at sixteen years of age, and was appointed by that society to read lectures in the Belles Lettres and rhetoric, both at Tours and at Paris. A heavy infirmity soon disqualified him from the task, and he was compelled by the recurrence of grievous headaches to embrace an occupation apparently just as ill-adapted as that which he quitted to receive the education of the sons of Henry, de Due longueville. That nobleman, who regarded him with singular affection, died in his arms, and Bouhours published an account of his illness and last moments, Paris, 1633. His second publication was Histoire de la Compagnie des Indes, which has been translated into English. He was then engaged on a commission to the Roman Catholic refugees from England to Dunkirk; and was introduced to the substantial patronage of Colbert by two critical works, Remarques et Doutes sur la Langue Francaise, et Les Entretiens d'Ariste et d'Eugène, 1671. In the latter occurs a question most offensive to German national pride, 'Whether it be possible for a German to be a poet?' It was, however, awarded a host of critics. Baillet affirmed that few exceeded Bouhours in knowledge of French stile et des locutions: and the Jugemens des Savans contain more than one very favourable opinion from the censors of Trevoxy. Ménage, in his native tongue, expressed a just, unknown perspicuity in the world as to the general principles of grammar; and that his Doutes contained more faults in language, learning, and judgment, than they filled pages; that he had never read the bible; that he was unversed in Italian, concerning which he wrote a great tract, than unskilful theologian, and an unsound logician. Notwithstanding this cutting and ferocious declamation, it is said that Bouhours cultivated and enjoyed the friendship of Ménage; and Colbert certainly assigned to him the education of his son, the Marquis de Seignelay. His other chief works were Dialogues sur la manière de bien penser dans les Oeuvres d'Esprit, 1687, in which the interlocutors Eudeox and Philante address each other in a strain of adulatory compliments little suited to the investigation of truth. Voiture is spoken of as a Religieux de Saint-Père, to whom he addressed his Dialogues. In 1683 Bouhours published a Life of Ignatius, and not long afterwards one of Francis Xavier. The latter is chiefly remarkable as having been selected for translation by Dryden soon after his profession of the Romish faith. Xavier was the saint, to whose patron Saint, of Anna of Austria, believed that she was indebted for her son, Louis XIV., after twenty years of barrenness; and Dryden, in his Preface to Mary of Esté, states that the queen of England in like manner has chosen the apostle of the Indies as 'one of her celestial courtiers.' As a judicious and elegant writer, that Life of Xavier, excluding all that is incredible, profane, trivial, and absurd, but fully exhibiting the heroic self-devotion, the courage, the patience, the acuteness, and the perfection of the indefatigable missionary, would be a work of deep interest, and of great utility to the history of Europe in the service of John Casimir, king of Poland.

Nothing more of his life is remembered, but such of his works (which were many, see the Bibliogr. Univ. and Lalande Bibliogr. Astron.) as by themselves or their consequences enable him to rank among the great men of science. Bouillau was a combination of a fanciful sculptor and a hard-working calculator, a good scholar, and well versed in the history of astronomy. His notion that light is a sort of substance intermediate between mind and matter enables him to the first application, and his Phisicall astronomy to the rest.

The earlier followers of Copernicus were accustomed to rank themselves, and to be considered by others, as followers of some one or other among the sages who advocated, or were supposed to advocate, the system. In the first place, there was Pythagoras, Aristarchus, or Philebus. The first work we shall notice of Bouillau is his Philolus, seu de vero Systemate Mundi, 1639. After this he gave an edition of Theon of Smyrna, 1644, and in the following year his Philolus, seu de vera Astronomia (with an Astronomical library he calls it Astrologia), which contains: 1. Prærogomena on the history of astronomy, which are often cited, and are the basis of several facts. 2. An exposition of a system of astronomy, which is Copernican as to the annual
motion of the earth and Ptolemaic as to the diurnal motion, and the precession of the equinoxes. It is throughout an attack upon the laws of Kepler, of which he only admits the image of the planets to move in ellipses. Each ellipse he treats as the section of an oblique cone, one of the focus of which is in the axis, (the sun being in the other focus,) and he asserts that the planets describe equal angles in equal times round the axis, or rather that a plane passing through the two foci of the ellipse is said to describe equal times. The celebrated hypothesis of Dr. Seth Ward consists in supposing the planet to describe equal angles in equal times about the foci of which the sun is not. Both hypotheses are very nearly true for ellipses of small excentricity, and of the two, that of Brouillon is said to have a little to the right. Seth Ward replied to Brouillon in his Idea Trigonometriae Demonstrata, &c. Oxford, 1654, and the latter rejoined in a tract entitled Astr. Phil. fundamenta clavis eripita, Paris, 1657. 3. A set of tables, styled Pholotactes, calculated for the meridian of Paris (Tycho Bræe’s Observatory). Brouillon here makes use of various Arab observations detected by himself in the Bibliothèque Royale. It must also be noticed that he was the first who disinterred the observations of Thitus [Astronomy, vol. ii. p. 632]. These tables have received great praise, and are not without their merits: but most of their value consists in what is taken from Kepler’s methods, or from the Rudolphine Tables.

Brouillon imagined that the laws of the planetary motion were derived from geometrical reasons. He blames Kepler for attending to any other method of determining a law. But still he had the good fortune to make a guess, which, had he been Newton, would not have lain idle in his hands. He asserts, in opposition to Kepler, that the statement of Kepler’s law of the square of the time is not inversely as the distances, but inversely as the square of the distances. He is thus the first who started this notion. He has certainly the advantage of Kepler in another point, when he asks why the sun only attracts the planets, and why the planets only resist motion, and do not resist it. As the first sentence in which the law was (though but as a supposition) announced, which has since been found to regulate the motions of all the planets, must be a curiosity, we shall give it at length from p. 23 of his book: "Phil. vir unguis ad se partem declinans in planum similis ad sectam in plano et rectam in planum, et per sectam in plano et rectam in plano eadem in omnem rectam sectam inversurum est, et lineae rectae cum illius formant angulum rectum." Brouillon’s method is still in use, and his results are still employed in the determination of the positions of the sun and planets.

We shall also mention of Brouillon his Opus novum ad demonstrandum Aequationes, Paris, 1678, which contains a collection of the researches contained in the Arith. infin. of Wallis, but not applied to geometry: and also his Catalogus Bibliothecae Thuaniana, made by him in conjunction with James and Peter Dupuis (Putanus), Paris, 1679. This is an excellent representation of the state of the library, and we shall have frequent occasion to quote it. (Bibl. Univ., Life by Delambre, and Delambre Hist. Ast. Mod.)

Among the tables of the Astronomia Philolatiae are the Rudolphine catalogue of stars; the catalogue of southern stars subject to the astrolabe, by A. van der Carmen. It was sent to Kepler by Bartichius from Bayer’s manuscripts; and some Persian tables brought into Europe by George Chrysococara.

BOUL, the canton of an ancient and duchy of that name, now forming part of the prov. of Luxembourg, is situated on the left bank of the river Seomy, and 14 m. from its junction with the Maase, in 49° 48’ N. lat. and 4° 59’ E. long. The duchy is on the W. side of Luxembourg, between it and Champagne, and under the French empire when the duchy, the duchy of the E. of the Seomy, and the Maase. It is a hilly district lying in the middle of the Ardennes.

Bouillon is a small neat town and contains about 2500 inh. It has two communal schools, in which 130 boys and 160 girls are instructed. The castle of Bouillon, which is said to be impregnable, is built upon a steep rock overlooking the town, but is itself commanded by the neighbouring hills.

The town and duchy of Bouillon were the hereditary possessions of Godfrey, the leader of the first crusade and king of Jerusalem, which city he took in 1099. To provide funds for his expedition, Godfrey sold the duchy to Albert, bishop of Liège, subject to the right of redemption on the part of the vassals. Godfrey, having died in the Holy Land, this right became the heir of his brothers, and remained for some time in the hands of the prince Bishop of Liège. The bishop having taken part in the war against France, Louis XIV. caused the town and castle of Bouillon to be seized in 1672, and at the congress of Nimeguen in 1678 stipulated for France. With the cession of Bouillon he promised to withdraw all his forces from the provinces for which it was not necessary. The cession of Bouillon was not, however, ratified by the Congress. The territory of Bouillon was, however, secured by the Treaty of Paris, 1763, and the town passed to Belgium. It is now an important town, with a large trade, and a considerable number of inhabitants. It is the seat of a bishopric, and is the center of a extensive district.

BOUVILLON, GODFREY (GODEFROY), DUKE OF The Ardenne, was the eldest son of Gustavus IV., count of Bouillon, a descendant of the female line from Charlemagne, and of Ida, daughter of Godfrey of Sierck, of the House of Basse- Lorraine. The date of his birth is not given, but the marriage of his parents took place in December, 1029. In his youth, Godfrey bore the great standard of the empire in the service of Henry IV. At the battle of Mersberg, Octo-

b. 2, 1071, he was slain off the field of battle by the tara Rodolph, who died on the following day in consequence of his wound; and Godfrey, whose distinguished bravery had been rewarded by the ducal title, was among the first who scaled the walls of Rome in the subsequent attack upon it. It is believed that remorse for the violation of the holy city of the west occasioned his vow of joining in the crusade which was to rescue the still more holy oriental metropolis. His celebrity in arms, his noble descent, and his general high reputation for both morals and valor, easily procured him the command of the German crusade, and his expedition; and 60,000 foot and 10,000 horsemen were placed under his immediate orders by the confederates. His gathering was formed on the banks of the Meuse and of the Moselle, and thence he advanced through Germany, Bohemia, and Poland, and by discarding himself to the good faith of Caroman, king of the last- named country, he removed the suspicions which had been justly excited in that prince and his subjects by the licentiousness of former pilgrims; and after a short delay, he was greatly assisted in his mission, and the Saracens by an essay of Hungarian cavalry. In union with the other divisions of the Latin army under the towers of Constantinople, he was employed in dispelling the not unreasonable jealousy displayed by Emperor Alexius; and afterwards, by the capture of Nicomedia, he received such a reward as to incite him to advance beyond the sea, and open the passage through Asia Minor. Antioch next fell before his arms, but not until it had detained him many months and had occasioned fearful loss. Among the pro-

digies of Godfrey’s (as some have supposed) however common-place, may here be recorded in its literal sense, the original historians of the crusades delight to record of their heroes, is an instance that Godfrey, on one occasion, during his siege, by a single stroke of his sword, split a Saracen from head to foot, and if this could be made the subject of a picture, it would be a fine piece of art. This was the only portion of the spot into the river Orontes, while the sitting half entered the town on horseback. In May, 1999, the crusaders advanced from Antioch and Laodicea to Jerusalem; and of the 50,000 men remaining alive, of whom one-half was unfit for service. The rest, while pursuing the hazardous diversion of the chase during his march through Pisidia, had been torn by a wild boar; and so greatly was he injured in this rough encounter,
that a litter became necessary for his conveyance over
Mount Taurus. On arriving at Jerusalem he eme wanged
his division on Mount Calvary, and after five weeks of
severest discipline. The City of Jerusalem was
raided by storm on July 15, 460 years after its conquest
by Omar. Three days of unsparring butchery succeeded
this brilliant triumph, during which the exertions of God-
fez were wholly inadequate to restrain the lawless passions of
the Christian army, after much intrigue, proclaimed
him first Latin King of Jerusalem; but his piety and mo-
dest forbearance rejected the title; and even when in the end
he consented to assume the inferior style of ‘Defender and
Father of the Holy City’ he remained in refusal to wear any diadem in that city in which his Redeemer had
been crowned with thorns. He secured himself in the
government to which he had thus been honourably elevated,
by totally overthowing the myriads brought against him by
the Sultan of Egypt, at Ascalon, Aug. 12, 1399. With the
assistance and advice of those pilgrims who were best skilled
in European jurisprudence, Godfrey compiled and promul-
gated a code named Les Assises de Jerusalem; which,
finally revised towards the close of the fourteenth century
for the use of the Latin kingdom of Cyprus, is printed in old
French in Beaumanoir’s Coutumes de Beaumanoir; Bourges
and Paris, 1690. Godfrey died in the year 1100, after much
too short a reign for the glory and happiness of his newly-
established kingdom. His virtues and talents are now chiefly
remembered by the scholasticism to which they are attached
they are fully avouched by the concurrent testimony of his-
torians frequently differing on other points.

BOULAC. [Cairo.]
BOULAINVILLIERS, HENRI DE, Count of St.
Sairee, was the eldest son of an antient and noble family, of
Picard extraction. He was the eldest son of Francois, Count of
St. Saire, and of Susanne de Manneville; born at the place
from which he derived his hereditary title, October
21st, 1558. He studied at St. Julien, where he particularly
admitted himself to the pursuit of the science of history.
After a short period of military service, embar-
rassed family circumstances, arising chiefly from an imprud-
ent second marriage which his father contracted late in life,
induced him to quit the army, and to live upon his estates in
that capacity. His time was devoted to literature; but none
of his writings were published from his own MSS. till
after his death, which took place on January 23rd, 1722.
His works on different portions of the feudal history of his
own country occupy three volumes folio, and are charac-
terized by a minute research for the facts of the time, and a
true taste for a correct and judicious manner of writing.

BOULOGNE, or, as it is sometimes called, to distingui-
sh it from other places of the same name, BOULOGNE-SUR-
MER (i. e., on the sea), a port and town of France, in
the dep. of Pas de Calais. It lies about 10 or 11 m. S.
of the Cap de Gris Nez, and at the mouth of the little river
Liane or Liane, which falls into the English Channel
and forms the estuary of Boulogne. It is on a straight
line, or 137 m. by the road through Bouvais, Abbeville,
and Montreuil; in 50° 45' N. lat. and 1° 35' E. long.

Boulogne is a place of great antiquity. It was in the
country of the Morini, a tribe of the Belgae, and was known
to the Romans by the name of Gesoriaecum, according to
the testimony of Mela, a geographer who flourished in the
time of the Emperor Claudius. The manner in which Mela
speaks of it implies that it was of Gallic origin; and it was
in his days the chief port of the province of the same
name. Some writers, and among them Montfaucon, Cluverius,
Sanson, and Le Quien, have endeavoured to show that Bou-
logne was also the Portus Itius, from which Julius Caesar
embarked for Britain, in his first (according to Strabo) and
second expedition (according to Justin), C. 54 B.C., a
view which is rejected by D’Anville, who agrees with Du Cange,
and with our own antiquary Camden, in fixing the Portus
Itius at Witsand or Wissam, a small town near Cap de
Gris Nez. Gesoriaecum became, under the Romans, the chief
port of the country, and the seat of an episcopal see. Thus
it was the tower erected by Caligula, when he marched
to the coast of Gaul in order to invade Britain; and the
Emperor Claudius, according to Suetonius, embarked here for
that island. The port in Britain with which a communication
was chiefly maintained was Rutupia, now Richborough,
near Sandwich. About the time of the Emperor Con-
statine, the name of Bononia was substituted for that of Gesoria-
cum, and the latter is not used by Ammianus Marcellinus,
Eutropius, and other writers of a later period. In the No-
centine annals, S. 929, and in the chronicles of the Church
of Antiochus, mention is made of the Civitas Bononensis as
distinct from the Civitas Morinorum, which indicates that
the country of the Morini had been divided between two
empires, and that the part forming the Bononia, which was
called by this name, was under the dominion of the

When, in the latter part of the third century, Carausius
was proclaimed emperor by the legions in Britain, he pos-
sessed himself of Bononia, which appears to have been one of
the Roman naval stations, for Carausius, before his
death, had his standard set upon the summit of the head of
the sea of pirates. This town was in consequence besieged by the
Cesar Constantianus Chlorus, father of Constantine the Great.
The siege, which ended in the capture of the town, was the
occasion of serious detriment to it. In the fifth century
Bononia is said to have been captured by Attila king of the Huns;
and in the ninth century it was

Les Boulevards Villeneuve.

The boulevards of Paris form a remarkable feature of
that capital. Those on the N. side of the Seine form a
continuous line of wide street or road, planted on each side
with elm-trees, that separate the houses of the city from
the Seine which runs rather a semi-ellipse, and extending in length to nearly
three miles, from the church of La Madeleine to the site of the
Bastile. They are about midway between the river and the
wall of Paris, which again is surrounded by a road planted
with trees, and the upper end of which terminates in a wall.
These boulevards are not worthy of much notice. They abound with places
of amusement for the working classes of Paris; and as the
duty on wine is not paid except it is actually conveyed
within the barriers, all the cheap wine-shops are on these
boulevards, which are not generally inviting as a mere
promenade.

The boulevards on the S. side of the Seine are planted
and laid out like those above mentioned, but are more ex-
tensive, and approach in some places close to the wall and
make the inhabitants of the quarter of the Seine enviable.

These boulevards are on the site of the walls of Paris
demolished by Louis XIV. (Paris and its Historical Scenes
in the Library of Entertaining Knowledge.)

BOULOGNE, or, as it is sometimes called, to distingui-
sh it from other places of the same name, BOULOGNE-SUR-
MER (i. e., on the sea), a seaport and town of France,
in the dep. of Pas de Calais. It lies about 10 or 11 m. of
the Cap de Gris Nez, and at the mouth of the little river
Liane or Liane, which falls into the English Channel
and forms the estuary of Boulogne. It is on a straight
line, or 137 m. by the road through Bouvais, Abbeville,
and Montreuil; in 50° 45' N. lat. and 1° 35' E. long.

Boulogne is a place of great antiquity. It was in the
country of the Morini, a tribe of the Belgae, and was known
to the Romans by the name of Gesoriaecum, according to
the testimony of Mela, a geographer who flourished in the
time of the Emperor Claudius. The manner in which Mela
speaks of it implies that it was of Gallic origin; and it was
in his days the chief port of the province of the same
name. Some writers, and among them Montfaucon, Cluverius,

When, in the latter part of the third century, Carausius
was proclaimed emperor by the legions in Britain, he pos-
sessed himself of Bononia, which appears to have been one of
the Roman naval stations, for Carausius, before his
death, had his standard set upon the summit of the head of
the sea of pirates. This town was in consequence besieged by the
Cesar Constantianus Chlorus, father of Constantine the Great.
The siege, which ended in the capture of the town, was the
occasion of serious detriment to it. In the fifth century
Bononia is said to have been captured by Attila king of the Huns;
and in the ninth century it was
and in fine weather of the coast of England. There are three
gates by which to enter the town. The walls of the
tower town have been destroyed. The citadel or castle, which
remains, is a ruinous masonry on a raised platform, or 

BOU

laid waste by the Northmen, who had landed just by.
(D'Anville; Expilly, Dict.) From the discovery of a ring to
which the cables of vessels were fastened, it is thought
that the ships lay in the same place as far as the present town
de Boulogne, in which case Gesoriacum must have been at
the bottom of a small bay.

Several Roman antiquities have been discovered at Bou-
logne; among these are medals and tombs. During 1825,
1826, and 1827, a large number of these discoveries were
made. Those discovered in 1826 were close to the sea; those
discovered in 1825 and 1827 were a little out of the town, on the
right of the road to Paris. The coffins in these last-mentioned
tombs were ranged in regular order, and the bones (some of
which bore the marks of deep wounds) were in good con-
servation. Several wells, a Roman road, and the founda-
tions of what was considered to be a votive altar, were discov-
ered at the same place; also many vases of different forms,
and a great number of medals. Similar discoveries had been
made at Caligula, as mentioned above. It was an octagon,
and each side is said to have been about 24 or 25 French
(equal to 266 or 268 English) ft. (at the base we presume),
and it rose to the height of 132 ft. * * Road twenty stages or
floors, and the diameter of the tower appears to have dimi-
nished 3 ft. at each stage, so as to form so many external gal-

BOU

lieries of a foot and a half in width, going all round the tower.
On the top of the tower lights were placed, so that it served
as a beacon and a signal. If any attack had been intended
the tower was built in a manner somewhat similar to that of
the Palais des Thermes, a Roman edifice at Paris. It was
built with iron grey-stone, three tiers together, succeeded
by a double tier of a yellow stone of a softer texture, and
on the top by a very hard stone. At the time of its erection it stood
more than a bow-shot from the sea, but the cliff was so much
excavated by the waves, and fell in so far, that the tower was at last undermined
and overthrown in the year 1644. It had been
Château d'Or, in the early part of the ninth century; and
when the English were in possession of Boulogne they sur-
rounded this tower with a wall and towers, so as to convert
it into a donjon or keep of a fortress. These walls and
towers shared the fate of the original edifice and in 1644
overthrown by the advance of the sea. The tower was
named in the middle ages 'Turris ordans' (supposed to be
a corruption of ardens, burning) or ordensis; and it is still
spoken of as the Tour d'Orde. There were in the middle
of the last century 152 towers, of these 48 still remain,
built of the materials as the above-mentioned towers.

In the year 1321 Philippe of France, son of the King Phi-
lippe Augustus, casued new walls to be built inclosing
a smaller space than had been occupied by the Roman town.
The walls were placed at the distance of the upper
(termed) of the eastern angle of which a citadel or castle
was built by the same Philippe. Boulogne had before this
time been erected into a county, of which he had acquired
possession by marriage. Boulogne now became a frontier
fortress. The old fortress of Boulogne was first taken by
the English in 1346. It is said the town was defended
by means in his power: he fortified the Tour d'Orde,
as already noticed, ordered another fort to be built between
that and the called la Maison Rouge, and some others
in different places. But by treaty, in 1350, Edward VI.
(when his name was stoutly-hold) had to defend himself,
while Boulogne was in possession of the English Herbert II. of France. It built
forts very near the town in order to straiten and annoy
the garrison.

After the recovery of the place from foreign dominion,
the English, which had risen as a sumptuous and noble
within the town, on the side next to the riv, was surrounded by walls
and the upper town strengthened by towers and other new
works; but in 1667, by order of the king, the towers were
blown up, and there remained to the upper town only the
wall which encircled it, the cisterns of the bulwark;
and to the lower town only a portion of its wall.
The walls of the upper town are still standing; they are
planted with a double row of trees, and afford a delightful
prospect, commanding a view of the lower town, the sea,
in the country: an infant asylum for children from 18 months to 6 years, provides for 120 young children of des-
stitute parents. There is a humane society for the recovery of
drowned persons. There are two girls’ free-schools, and
three boys’ free-schools, in the town. There are also 750
children; elementary free-schools for about 1200 boys
under the direction of the Frères de la Doctrine Chrétien-
te; a Lancasterian free-school; a free-school for navi-
gation, and two or three institutions which may be de-
cs. The fine art of building has been said to be any Collège Royal or high school at Boulogne, but there is
an abundance of private seminaries both French and
English; and there are academies for music and drawing,
in which gratuitous instruction is given. There is a museum
of natural history, with works of art, objects of art, &c.; also a good
public library of above 32,000 volumes and 300 MSS.; an
agricultural society, a society of the friends of the arts, and
a philarmonic society. Of places of amusement may
be mentioned the theatre, and the splendid bathing establish-
ment at comprising reading, music, assembly and gym-
rooms. Horse races have just been established, and balls,
fairs, and several fêtes in the neighbourhood called Ducsaisse,
fill up the circle of amusements.

The har. of Boulogne has been much improved of late
years, but is still difficult of access, and has not water
even when the tide is out. It consists of the channel of the
riv. Liane, and of a semicircular basin on the left
bank of the riv. At low water the vessels rest in the
mud, through which the stream finds its way to the ocean.
From the ocean the craft can enter the town on a course of
2000 ft. into the sea. The trade of the town is consid-
derable and is increasing. The fisheries are important.
The herring and mackerel seasons call into employment a
considerable capital, and several vessels are fitted out for the
fishery for mackerel. The farmers form a particular class in society, and their customs, dress, language
and habits remain almost the same amidst the changes
which the intercourse with foreigners has been working
in other classes. They are very superstitious.

Boulogne is the see of a bishopric, erected in the 16th century from part of the former
diocese of Thérouanne. It has now again lost its episcopal
rank. The cathedral, which was destroyed in the Revolution,
was considered one of the most ancient religious edifices in
France. Before the Revolution were some monasteries now
suppressed.

Boulogne was the birth-place of Thurout, an eminent
French naval officer: Le Sage, the author of "Gil Bias,"
and the English poet Churchill died here.

About a mile from Boulogne on the Calais road is the
column voted by the grand army to Napoleon as an expres-
sion of their esteem and admiration. It was also designed to
commemorate the victory of St. Jean deuz. Each soldier contributed a portion of his pay, and the first
stone was laid by Marshal Soult; but the work was not
finished till the reign of Louis XVIII., when the monument
was erected from its original purpose, being made to com-
memorate the return of the Bourbons, and in place of the
statue of Napoleon, by which it was to have been sur-
mounted, a gilt globe, adorned with fleurs de lis, has been
substituted. It is now however likely to be restored to its
original purpose of a monument in honour of Napoleon, and
may be considered a vase, for to be a vase as the bronze for the intended statue. The column is of the
Composite order, about 160 English ft. high, and more than
13 in diameter. There is a staircase within by which
visitors ascend to an iron gallery round the ball which sur-
mounts the column, from which gallery is a very extensive
prospect. The column is composed of marble from the
quarries of Marquesi in the neighbourhood. In the envi-
nions of Boulogne is the botanical garden, formed in 1784
by the Baron de Courcut, considered to be one of the finest
and most extensive in France. It contains a most extensive
and beautiful collection of plants, and is much visited by the
inhabitants or visitors of Boulogne.

BOULOGNE, a village in the immediate neighbour-
hood of Paris, to the S.W. of that city, is upon the right bank
of the river Oise. It was a fort in ancient times, and
was called Menu. About the fourteenth century a brother-
hood was formed here in honour of the Virgin by some
inhabitants of Paris who had returned from a pilgrimage
to Boulogne-sur-Mer. The chapel built by the brethren
of this community became crowded by the devotees of
Paris, and the vil. acquired the name of Boulogne, from
the name of the village where the pilgrimage was com-
pulsory. The population of the com. was, in 1832, 5391; of the vil. itself, 3216. Between Paris and the vil. of Boulogne extends the
Bois de Boulogne, an extensive wood intersected in all di-
rections by alleys and roads. Many of the fine trees which
have been here planted are now large, and there is an
extensive copse thinly scattered with young plants.
"Much of the wood was destroyed by the Prussians, when
they had their camp here at the close of the last war. In
passion week, the wood is the scene of an annual procession,
at which hymn-sheets are sold to the pilgrims by the
 inhabitants of little else than a string of vehicles filled by people desirous of
being as gay and merry as possible.

In the Bois de Boulogne were three Châteaux be-
longing to the royal family. That of Meitte, which was
acquired by Louis XV., is close to the vil. of Passy. The
Château de Madrid is said to have been built by
Francis I. after his return from captivity. This was de-
stroyed at the Revolution; of the present condition or use of
the Château de Meitte we have no late account. The third
château is that of Bagatelle, built by the ex-King of France,
Charles X., while Count d’Artois; and occupied, after the
restoration of the Bourbons, by his son the Duc de Berri.
The inscription over the portal, parvis sed apta ‘small but
convenient’, gives the true character of the place. (Planta’s
Parc de Paris.)

BOULONNOIS, a district in the former prov. of Pi-
cardie, deriving its name from its capital Boulogne-sur-
Mer, now forming part of the dep. of Pas de Calais. The
climate is rather cold, but the land is fertile in grain,
afforded great emolument for the peasants, whose milk
good butter is made. Some coal is dug, and
there are mineral springs. The Boulonnois was bounded on
the N. by the district in which Calais is situated, called the
Pays Reconnu, on the E. by Artois, on the S. by Ponthieu, and
on the W. by the sea; on the E. and W. it formed part of the
country of the Morini, a Belgian tribe. It appears to have become an her-
denry co. in the 9th century, and underwent various changes;
but its history does not present any points of interest. It
was re-united to the crown by Louis XI. (Expi. Dict.)

BOULTON, Matthew, was born Sept. 3rd, 1728,
at Birmingham, where his father carried on the business
of a hardwareman. He received an ordinary education at
a school at Deritend; and also acquired a knowledge of draw-
ing and mathematics. At the age of seventeen he effected
an invention, by which he shoed the boilers of his own
other articles of Birmingham manufacture. The death
of his father left him in possession of considerable property;
and in order to extend his commercial operations, he pur-
based, about 1762, a lease of Soho, near Handsworth, which
though only twenty-five years old, was in Staffordshire.
It would scarcely be possible to select a more striking instance of the beneficial changes
affected by the combined operations of industry, ingenuity,
and commerce, than that which was presented by Soho
after it had been some time in Mr. Boulton’s possession.
It had previously been a bleak and barren heath, but was
soon diversified by pleasure grounds, in the midst of which
stood Mr. Boulton’s spacious mansion, and a range of
extensive and commodious workshops capable of receiving
above a thousand artificers. These workshops were described as
the most perfect in the world, as being fitted for
striking both for their neatness and magnificence. In 1797
Mr. Boulton purchased the free-simple of this estate with
a considerable portion of land adjoining.

To Mr. Boulton’s active mind this country is eminently
indulged for the manner in which it extended its resources,
and brought into repute its manufacturing ingenuity.
Water was an inadequate moving power in succeeding his
designs, and he had recourse to steam. The old engine
on Savary’s plan was not adapted for some purposes in which
it was required. There was a dearth of shot, where his
workmanship of delicate and precise action. In 1769 Mr. Boulton
having entered into communication with Watt, who had
obtained a patent for some improvements in the steam-
engine, Watt was induced to settle at Soho. In 1775 part
of the Lombe patent of Mr. Boulton fell under the
protection of his patent for improvements in the steam-engine; and on
his entering into partnership with Mr. Boulton, the Solo
works soon became famous for their excellent engines. Dr. Ure remarks (Philosophy of Manufactures, p. 29) that there are many engines made by Boulton and Watt forty years ago, which have continued in constant work all that time with very slight repairs. Not only was the steam-engine itself brought to greater perfection, but its powers were increased. One great step in the progress was the success so remarkable as in the machinery for coining, which was put in motion by steam. The coining apparatus was first put into operation in 1783, but it soon underwent important improvements, until it was at length brought to an astonishing degree of perfection. One engine put in motion eight machines, each of which stamped on both sides and milled at the edges from seventy to eighty-four pieces in a minute; and the eight machines together completed in a style far superior to anything which had previously been attempted, from thenceforward, in an hour. The manufacture of plated wares, of works in bronze, and or molu, such as vases, candelabras, and other ornamental articles, was successively introduced at Soho, and the taste and excellence which these productions displayed soon obtained for them an unwarranted reputation in every part of the world. Artists and men of taste were warmly encouraged, and their talents called forth by Mr. Boulton's liberal spirit. The united labours of the two partners contributed to give that impulse to British industry which has been so fruitful.

Mr. Boulton has been described by Playfair as possessing a most generous and ardent mind, to which was added an enterprising spirit that led him to grapple with great and difficult undertakings. 'He was a man of address (continuing) that acquired the confidence, the regard, and the affection of all men.' Playfairium and his friends believed in the success of their projects. 'The people of all ranks with great freedom and without ceremony.' Watt, who survived Mr. Boulton, spoke of his deceased partner in the highest terms. He said, 'To his friendly encouragement, to his partiality for science, and to his liberal disposition to apply the discoveries to the purposes of art, to his intimate knowledge of business and manufactures, and to his extended views and liberal spirit, may in a great measure be ascribed whatever success may have attended my exertions.' Mr. Boulton explained the principles on which the Soho works were operated. He was the first to perfect the steam-engine, before Watt perfected the construction and occasional any return of profit.

Mr. Boulton died August 17th, 1809, in his 81st year. His remain's were attended to the grave by several thousand individuals, to whom medals were given, recording the age of the deceased and the day of his death. The body was borne to the grave by the oldest workmen connected with the works at Soho, and about five hundred persons belonging to that establishment joined in the procession. Mr. Boulton left, with the regret of the whole country, the Soho works.

BOUNTY, a term used to signify a premium paid by government to the producers, exporters, or importers of certain articles, or to those who employ ships in certain trades. (McClure's Dictionary of Commerce.) A distinction is made between bounty or bounties, which latter is not liable to the same objection as the former. Premiums given by the public to artists and manufacturers who excel in their particular occupations must also be regarded in a different light from bounties applied to the support of particular branches of commerce. [DRAWBACK: PREMIUM]

Perhaps the most objectionable and vicious mode of protecting the interests of commerce is by means of bounties. A tariff may be framed on such narrow and exclusive views as to exclude the home market to a country, but the evil consequences are less palpable; and hence bounties have ceased to be considered as advantageous to the general interest, while high or prohibitory import duties are more or less adopted by all commercial nations. The question of bounties and their policy is discussed by Adam Smith in his Wealth of Nations, book iv, chap. 5; and the subject has also been treated in a very comprehensive manner by the late Mr. Ricardo in his Principles of Political Economy and Taxation. Postlethwaite, in his Dictionary of Commerce, published in 1779, defines a bounty or bounties, refers to a work specially dedicated to this and similar subjects; and the reason he alleges for so doing is that they are very numerous. After the publication of Adam Smith's work bounties began to be regarded with less favour, and have at length sunk into complete discredit. They are now no more relied upon as a means of furthering the true interests of commerce than the balance of trade, as it was termed, is regarded as an unfailing indication of the increase or diminution of national prosperity. With this latter notion, indeed, the policy of bounties was very materially connected. It was thought that they operated in turning the balance in our favour. Adam Smith says (chapter 2, section 12): 'Manufacturers, as every other class of workmen, are threatened if the government does not undertake to secure their goods as cheap or cheaper than their rivals in the foreign markets. . . . We cannot (he adds) force foreigners to buy our goods, as we have done our own countrymen. The next best expedient, it has been thought, therefore, is to provide them for buying.' Bounties in truth effect nothing more than this, and the chapter from which the above extracts are made affords the most satisfactory proofs of their impolicy. The propositions maintained are, that every trade is not a nation, and that a nation, when it has developed manufactures, is not able to produce an unprofitable article, and this particular branch of industry will soon become extinct. It perhaps happens that the general interests of the country are thought to be peculiarly connected with the species of industry in question. Observe what, then, is the end of a bounty, in order to prevent its falling into decay. At this point commences the operation of bounties, which are devised for the purpose of producing an equilibrium between the cost of production, the market price, and a remunerating price, the last of which is often the pivot on which the remunerability of every species of industry depends. Smith observes 'The bounty is given in order to make up this loss, and to encourage a man to continue or perhaps to begin a trade of which the expense is supposed to be greater than the returns; of which every member is threatened with ruin, and which is of such a nature, that if all other trades resembled it there would soon be no capital left in the country.' And he adds:--'The trades, it is to be observed, which are carried on by means of bounties are the only ones which can be carried on between two countries a considerable time together, in such a manner as that one of them shall always and regularly lose, or sell its goods for less than they really cost. . . . The effect of bounties, therefore, can only be to force the trade of a country into a channel which cannot succeed better than that in which it would naturally run of its own accord.'

One of the most striking instances of the failure of the bounty system occurred about the middle of the last century in connection with the white herring fishery. A joint stock company was formed in a small part of Scalby parish for the purpose of vigorously prosecuting this branch of our fisheries; and though in addition to a bounty of 30s. a ton the Company was allowed an exportation bounty of 2s. 6d. a barrel, the delivery of British and foreign salt free, and a thousand other inducements, the trade being wholly paid for by the government, yet, in spite of such extraordinary encouragement, the greatest portion of the capital employed was lost. Individuals, for the sake of the bounties, rashly ventured into the business without a knowledge of its nature and its continuance, while the government was paying on in the most economical and judicious manner.

The bounty on the exportation of corn was given up in 1815, and those on the exportation of linen and other articles ceased in 1830. The following (Government Official Tables, p. 4) shows that bounties will probably soon cease to be considered as forming any part of our commercial policy:

**Bounties for promoting Fisheries, Linen Manufactures, &c. in the United Kingdom.**

Bounty, Mutiny of the. [Byron.]
Bounty, Queen Anne's. [Benjamin.]

Bourbon, the name of a family that succeeded the line of Valois in 1553, and has reigned in France from 1589 to the present time, with some interruption during the republic and the empire of Napoleon Buonaparte. The families, both of Valois and Bourbon, were branches of the stock of Capet. The Bourbons had branched off earlier than the Valois; the former being descended from a son of St. Louis, the latter from a brother of Philip the Fair. The genealogy of the Bourbons, here given, is chiefly taken from the elaborate work of M. Desormeaux, historiographer of the House of Bourbon, &c. &c. This work is de l'imprimerie royale, and may be considered as an official document and the best authority on the points within its province. The following have also been consulted:—Histoire des Bourbons, 4 vols. 12mo., à Paris, 1793. Memoires et Recueil de l'origine, Alliances, et succession de la famille Royale de Bourbon, Branche de la Maison de France, a la Rochelle, 1537. Cox's Memoirs of the Kings of Spain in the House of Bourbon. The ancestor of the Bourbon branch of the royal family of France was Robert the sixth and youngest son of Louis IX. commonly called St. Louis, a title which few of the so-called Saints have better earned, if the virtues of justice, temperance, and rigid probity confer a claim to that title.

Robert was born in 1256. In 1270 his father set out on his African expedition, where he perished before Tunis. Philip the Hardy, successor of St. Louis, gave Robert in marriage to Beatrice of Burgundy, a princess of the blood, only daughter and heiress of John of Burgundy, baron of Charolais, and of Agnes, dame de Bourbon and St. Just, daughter of Archambault, sieur de Bourbon. By this marriage Robert united to his appanage of the comté de Clermont, the province of the Bourbonnais, and the Charolais, and the seigneurie of St. Just. His descendants took the name of Bourbon.

St. Louis.

Robert, Count de Clermont.
Louis I, Duke of Bourbon.

Jacques de Bourbon, Count of la Marche.
John, Count of la Marche, married Catherine de Vendôme.

Jacques II, Count of la Marche.

Louis de Bourbon, Count de Vendôme, ancestor of the Duke of Orleans. He married Claude de Vendôme, and of the royal family of France of the name of Bourbon.
Antoine de Bourbon, Duke de Vendôme, by marrying Jeanne d'Albert, became King Navarre.

Louis, first Prince de Condé, from whom are descended the branches of Condé and Orléans.

Philip, Duke of Orleans. (Regent Orleans.) Dauphin (Monsieur), son of Louis XIV.

Louis II, Duke of Bourbon.

Denis, Duke of Bourbon, by the will of Charles II.
Louis XIV.

Louis, Duke of Bourbon, and son of Louis XVI.

Louis Philippe, ditto.

Louis Philippe Auguste Egide.

Louis Philippe, now King of the French.

In the time of Robert's son, Louis, the Bourbonnais was created into a duché pairie. Therefore, upon the death of the last of that line, the title of duke of Bourbon, retaining the arms of France, Duché pairie at that time denoted very high power and dignity. At the time of this creation there were in France only the dukes of Burgundy, Aquitaine and Brittany, and the title of pair was only bestowed on the children of the king, the princes of the blood, and seigneurs of the most noble title. A younger son of this Louis, duke de Bourbon, married Jacques de Bourbon, Count of la Marche and de Ponthieu. The domain of Vendôme having come, as that of Bourbon had done before to Robert, to the second Count of la Marche by marriage, his second son assumed the name of Bourbon Vendôme, and from him descended the branch of which the last is extinct on the death of the famous Constable de Bourbon. The preceding table will convey at once a more distinct idea of the course of descent, and will give a synoptical and at the same time clear view of the branches of the Bourbon stock, which have more immediately given kings to France. It has not been judged necessary to give all the counts and dukes de Vendôme. A hiatus has therefore been left between Louis de Bourbon, the first count de Vendôme, and Antoine de Bourbon, duke de Vendôme, and king of Navarre, the husband of Henriette IV. of France.

Bourbon, CHARLES DE, Constable of France, commonly called the Constable de Bourbon, or the Constable Bourbon, was born on the 17th of February, 1489. He was of the Montpensier branch of the Bourbon family, being the second son of Gilbert de Bourbon, count of Montpensier, viceroy of the kingdom of Naples. By the death of his brother at the age of eighteen, he became the eldest son of his branch, on which the principal territories of the Bourbons were entailed. He was educated at Moulins, the principal town of the branch of Bourbon, and situated in the centre of their large possessions. He was carefully trained in all the athletic exercises, which were regarded as by far the most important part of the education of the nobility of his time. But while his physical education was of the highest, it did not at all unseat his mental: and the manner in which he received the lessons which were given him in the science of war, as far as it could then be called a science, gave indication of no inconsiderable capacity; while his general behaviour indicated more thought than could be expected from his years.

The last duke de Bourbon, Pierre II, died leaving a daughter, Suzanne de Bourbon, who had been betrothed to the duke d'Alençon. It being considered impolitic to allow so many domains to accumulate in the person of the duc d'Alençon, and there being also a double respecting Suzanne de Bourbon's title, Louis XIV. appointed a commission, composed of princes, ministers, seigneurs, councillors of state, and lawyers, to examine the respective titles of Suzanne de Bourbon and that of the Montpensier. The commissioners reported that the right of Montpensier appeared incontestable, but they proposed to settle the dispute by marrying the two claimants. Louis XIV. approved of the recommendation, and the marriage took place accordingly. It required all the persuasion of the damoiselle de Bourbon to this compromise, for, should she refuse to supply herself presided over his education, of the superiority of the young count de Montpensier, in mental as well as bodily accomplishments, in capacity of understanding, as well as of beauty, strength, and address over not only most nobles, but most men of his time.

In the marriage articles it was stipulated, 1st, that there should be a cession of all their property in favor of the survivor; 2nd, that the children who should be born of the marriage should inherit all the domains of house of Bourbon; 3rd, that the failure of the branch of the children of the wife should devolve on Francis, Monseigneur de Bourbon, only brother of Montpensier; 4th, Montpensier assigned a jointure of 10,000 livres a year to his wife on the Bourbonnais. The king renounced for himself and his successors the pretended rights which the treaty of marriage of the duke Pierre II. with Anne of France, daughter of Louis XIV., gave to the crown over all the property of the House of Bourbon, if he should die without male children.

Having become the richest of all the princes of his house, who have not reigned over the crown, the first recognition of the new duke de Bourbon corresponded with his wealth. He never travelled without a brilliant body of horse-guards, and without being surrounded by the chief noblesse of his domains, and his principal officers, who composed a court little inferior to that of a king.

The first essay in arms of the duke was in the expedition which Louis XIV. made in person into Italy. In this expedition Bourbon devoured himself with much industry and
seal to the study of strategies. He selected for his friends and masters La Trompille, Bayard, and others, who were distinguished as military leaders. He conversed with them on plans of campaigns, marches, encampments, on the details of discipline and existence. From the generals he went to subordinate officers who had acquired reputation. At night, when he retired to his tent or his cabinet, he reduced to writing his observations and the result of his conferences. Such is the labour of those, if we may be allowed to transfer the sentence of Johnson, who fights for immortality.

Bourbon returned to France in 1599. In the war of the league of Cambray he had an opportunity of displaying his talents for strategy. Upon the death of Gaston de Foix, in 1512, the army of Italy demanded with acclamations Bourbon for their leader. But Louis XII. did not comply with its wishes. It is reported that he appeared to be somewhat afraid of Bourbon; that he was heard to say that he should have wished to see in him more condescension, more gravity, and less tactiousness. 'Nothing is worse,' added he, 'than the water which sleeps.'

Upon the accession of Francis I. to the crown, Bourbon was immediately (1515) appointed constable. It will afford some notion both of the character of the times and the influence of the duke of Bourbon, to mention that at the king's coronation, when Bourbon represented the duke of Normandy, his suite consisted of two hundred noblemen.

The constable devoted himself assiduously to the duties of his office, and in the most important of the government by which France was governed. He introduced many important regulations respecting the discipline of the troops. He particularly directed his attention to the protection of the citizens and peasants against the insolence and oppression of the feudal gentry. His government was characterised by a considerable administrative talent: and his unbounding austerity in enforcing the rules he had laid down showed that he fully understood how much a severe discipline conduces to victory. The sensible effects of this system were shown very clearly in the victory of Marignano, which was mainly owing to Bourbon's skill and valour.

Our space will only permit the notice of as many of the events in which Bourbon was engaged as are necessary to the understanding of the main incidents which determined his character and shaped his destiny. And these events, in a work like the present, are of more importance than perhaps they may appear to superficial inquirers; for the events of Bourbon's later career might be said to have influenced in an inconsiderable degree the destinies of Europe, and hence that of man.

When Francis I. returned to France in 1516, he left the constable in Lombardy as his lieutenant-general. While he proposed to the court the conquest of the kingdom of Naples was making preparations for this expedition, an unexpected invasion by the Emperor Maximilian of Austria took place. Against this irruption Bourbon's first proceeding was to repair the fortifications of Milan, for which purpose he levied a body of 6000 pikemen, and, being short of money, loaned his high character in condition to grant him any aid, he applied to Albert de la Piére, a renowned captain of the canton of Zürich; and he obtained, by his own credit, permission to levy a body of 12,000 men, for which purpose the count had a pretext. The length arrived and received three months' pay in advance, refused to go out and attack the emperor, who was encamped at the gates of the town, on the plea that they would not slaughter their fellow-countrymen attached to the service of the emperor. Bourbon disregarded the propriety of the act, and they coolly departed with his money in their pockets, with the exception of Albert de la Piére and his company of 300 men. It happened fortunately however that the Swiss in the emperor's army, to the number of 14,000, mutinied for an advance on Milan, and which the emperor had reckoned on discharging at the expense of the inhabitants of Milan. This event and its immediate consequences caused the dispersion of the formidable army of Maximilian.

When Bourbon appeared after these events at the French court, which was then at Lyons, he was received by Francis with great distinction. But gradually the king was observed to cool. Historians have usually ascribed this alteration of the king's behaviour towards Bourbon to the influence of his mother, Louis of Savoy, Duchess d'Angoulême. This princess, who at forty retained striking remains of beauty, and who was not a woman of very nice morality, is said to be contemptible in the eyes of Bourbon. Bourbon is said to have treated her advances with coldness and even disdain. The rage of a woman thus slighted has become proverbial; and Louis of Savoy was not one to belie the proverb. The king espoused the quarrel of his mother, the cause of which charity would suppose him ignorant. The consequence was, one of the most signal examples of ingratitude and injustice upon record.

They began by refusing the payment of the sums which he had borrowed in order to save the Milanese, as well as all his appointments as prince of the blood, constable and chamberlain of France, and governor of Languedoc. This, however, was light compared to what followed; and was the less to be considered as a wanton insult from the circumstance that Francis, partly by his own profligate expenditure, partly by the cupidity of his queen, was in want of money, notwithstanding the resources opened to him by the chancellor Du Prat, in the sale of the offices of the magistracy. A breach between Francis and Bourbon was more easily effected from the contrast between their characters, which was great. Francis was gay, open, glib, superficial, fond of pleasure, and averse from business; Bourbon was grave, reserved, thoughtful, profound, and laborious.

In April, 1521, the constable's wife, Suzanne de Bourbon, died. He had previously lost the three children he had by her.

The breach between the court and the constable daily widened. In a northern campaign against Charles V., Francis gave the command of the vanguard, which, by a practice established in the French armies, belonged to the constable. But the Duke of Alençon. From that moment Bourbon regarded himself as degraded from his dignity. He was frequently heard to quote that answer of a courtier to Charles VII., who asked if anything was capable of shaking his fidelity:—"No, Sire, no, not the offer of three kingdoms of France." Fresh injuries and insults were heaped upon Bourbon. The chancellor Du Prat, in the spirit of the vilest petit-fogger, by examining the titles of the house of Bourbon, thought he saw, that by perversion of some words, he might be able to deprive the constable of his estates, and convey them to the Duchesse d'Angoulême, or to the king. He explained to the duchess that she had a right to the greatest part of the property of the house of Bourbon, as the nearest relative of Suzanne de Bourbon, and that the rest reverted to the crown. Madame admired the ability and zeal of the chancellor, and entered fully into his views. She now flattered herself that Bourbon would choose rather to secure his rights by marrying her, than be reduced to misery. But the haughty and austere Bourbon, when his friends urgèd him to consider the state of his family, under the favourable light her power, wit, and riches, said that he was so sure of his right that he was ready to try it before any or all of the courts: he declared, moreover, that honour was far dearer to him than property, and that he would never incur the reproach of degrading himself so far as to share his bed with a profligate woman. The result of such a trial, under such a government as that of France at that time, may be easily foreseen. The parliament decreed that all the property, however small, of all the property, should be sequestrated: which was the case with Bourbon.

It will be unnecessary in a work like this, to follow Bourbon step by step in the disastrous route that conducted him from being the first subject in France, to be an exile and an outlaw. We have traced his career hitherto with some minuteness, as tending to throw light on the European governments in the sixteenth century. If such a thing had happened in France, two or perhaps even one century earlier, to a man so powerful as Bourbon, at one time a king of France, his family and estate, the probable result would have been very different. The only thing of which we are most likely have terminated in Charles of Bourbon filling the throne of France in the room of Francis of Valois. But about or somewhat before this time had arisen that devotion to a royalty, which would seem to have been first introduced by the plebeian legists or lawgivers. The royalists were everywhere led by self-interest to adopt such a measure, in order at once to obtain favour with royalty, and render royalty more able to advance and support them against the old noblesse.
of the sword. As it was, another fate was reserved for Bourbon.

Francis having obtained intelligence that Bourbon had entered into a secret correspondence with the Emperor Charles V, Bourbon, at the bidding of his native Austria, invaded France, which he did with some difficulty. Some proposals which were afterwards made to him by Francis were rejected by Bourbon, who had good reason to distrust his sincerity. Bourbon was now thrown upon Charles V, who, though not as weak as his grandson, as regards his reliance on his own strength, instead of a powerful ally, as he had first expected, appointed him his lieutenant-general in Italy. He surrounded him however with colleagues and spies.

In 1525 the result of the famous battle of Pavia, where Bourbon and the King of France were both taken prisoners, which he had raised professedly for the emperor's service, chiefly by means of his high military reputation, afforded him ample vengeance for his wrongs, in the destruction of the French army, and particularly in the capture of Francis, and the death of Bonnivet, his chief personal enemy. But Bourbon, although to his military talents and skill the victory at Pavia had been mainly owing, found that he was still regarded with distrust by Charles, and with jealousy by his generals. The slight and mortifications, too, to which he was subjected in his own army, and to which he submitted, rendered his position anything but an agreeable or easy one; and contributed, with the roving and unsettled life he had led since his exile, to produce in him something of the recklessness, and even ferocity of the bravos of Spain, and the insolence and contempt which heaped much of the genuine and legitimate character of large and wholesale robbery. It was in the complex state of mind, made up of some such elements as these, that he came to the resolution of acting independently of the emperor, and continuing the war which in half the reign of Francis I. had been going on. Fortune seemed to throw in his way one means of accomplishing this object, in attaching to himself, by the allurement of an immense booty, the army which the emperor did not pay. He formed the daring resolution of leading that army to Rome, where the basilical city, as the reservoir of the empire, and the church, and all the treasures of the church, a city so vast and magnificent, and he immediately proceeded to put it in execution.

This expedition has been considered one of the boldest recorded in history. Bourbon was obliged to abandon his communication with the Milanese, to march for more than a hundred leagues through an enemy's country, to cross rivers, to pass the Apennines, and to keep in check three armies. Add to this, what rendered the enterprise important as distinguishing it from others of a similar nature undertaken by large robbers, the moral danger and difficulty of attacking the very centre of the power of catholicism, the devastation it would produce in the quarter, and, to a certain extent, destroying the powerful spell by which it had so long bound up the faculties of mankind. We do not think that the praise of any high exercise of moral courage is due on this score to Bourbon, for it does not appear to us that, even if there had been no consequences hinted at above, but chiefly, if not solely, by the necessity of the circumstances in which he was placed.

On the evening of the 5th of May, 1527, Bourbon arrived before Rome. On the following morning, at day-break, he commenced the assault, being in the first man who first mounted the wall, and also, according to the French historian, the first who fell, by a shot fired, it is said, by a priest. Benvenuto Cellini says, that it was he who shot Bourbon; and Guicciardini does not clear up the point. It is certain that he was among the foremost, and that he fell in the beginning of the assault, and that his army took the city, in which they committed all, and more than all, the usual excesses of a sack.

Charles V. made it one of the conditions of peace with Francis, that the possessions of the constable should be restored to his family, and his memory re-established. Francis eluded, as much as he was able, the fulfilment of this condition. But the wreck of the constable's fortune was sufficient to render obliged new house, Louis de Bourbon, Prince de La Tremouille, and afterwards Duke de Montpensier, one of the richest princes of the blood, although it did not form, perhaps, a third part of the revenues of the Duke de Bourbon.

Bourbon is reported to have been one of the handsomest men of his age; and he is said to have been an exemplary husband, and free from the gross licentiousness of the times. He was much beloved by his vassals, who with that resolution incredulity which is sometimes observed in uneducated persons with respect to any report injurious to those they love or respect, refused to believe the account of his death, and persisted in expecting to see him return one day covered with glory, to the great satisfaction of his devoted vassals.

The authorities the same as in the preceding article, with the addition of the French historians and Guicciardini.

BOURBON is situated in the Indian Ocean to the E. of Madagascar. The town of St. Denis at its N.W. extremity is in 26° 11' 30" S. lat., and 53° 30' E. long., and this place the island extends in a S.E. direction for about 60 m. with a breadth of about 45 m. The whole surface may be about 2400 sq. m., or about 400 sq. m. more than the area of Norfolk.

This island was discovered by the Portuguese navigator Mascarenhas in 1542, and at that time it was not inhabited. It received the name of Mascarenhas or Mascareigne. The French in 1642 sent some criminals from Madagascar to it, and settled a colony in 1649, when they gave it the name of Bourbon, which at the beginning of the French revolution was changed into that of Réunion, and afterwards into Bonaparte and Napoleon. In 1815, on the restoration of the Bourbons, the island resumed its old name of Bourbon.

Probably all the island owes its origin to volcanic agency. The greater part of its surface consists of lava, basalt and other volcanic productions, and on the remainder traces of such rocks are frequent. Towards the S.E. extremity there is a volcanic constantly in action, and naturalists who have had an opportunity of examining the high mountains around the bay between this and that point, there has also been an active volcano at some remote date.

The island consists of two systems of volcanic mountains and rocks, and a kind of plain which divides them. The north-western mountains form the larger system and cover one half of the island. Here rises a huge mass of lava with three inaccessible peaks, called the Salazes, whose absolute elevation is estimated by Bory de St. Vincent at nearly 1500 toises, or 4900 feet. The country surrounding this mass exhibits large tracts of lava and basaltic scoriae, but in some basins or vales. The basaltic prisms are frequently disposed in regular columns, but these as well as the lava rocks are frequently split by deep narrow crevices. The soil which covers only a small portion of this region is evidently the product of decomposed lava, and for the most part is still incapable of supporting any vegetation. It is of a red colour and resembles clay indurated by fire. At some places however it is softer, and has been planted with coffee-trees; and in others, forests of timber-trees are growing. The rivers are only torrents, which descend from the mountains at such a rate that it is dangerous to approach the water's edge. In some places others carry great volumes of water, which they pour down the steep declivities with incredible impetuosity. Their course is through extremely narrow gorges, and in deep beds. Navigating them is not an easy matter, and the Adjutant General. The shores of the island are rocky and from not generally very high, except along the S.W. coast between St. Paul and St. Petre. In a few places a narrow beach separates the rocks from the sea; it is composed of pieces of basalt and broken lava, which have undergone trituration in the sea, and afterwards been thrown ashore, intermixed with some calcareous pebbles and shells.

At the N.W. point of this region lies St. Denis, the capital of the island, with a pop. of 7000 or 8000. It has no harbour, and is only an extensive piazza, where a number of iron chains has been constructed for the purpose of enabling boats to land; at the end of it is a ladder by which persons who wish to go ashore may ascend; in all other parts of the island they must jump into the water. Approaches the town of St. Denis from the town of St. Paul, which is perhaps better, but no other place round from the island offers an anchoring ground for vessels.

The plains which separate this volcanic region from that in the S.E. district of the island, occupy perhaps one-third of the whole island. South-west of St. Denis, between the island, the plains of the Caflers and of the Lamplists, are divided by a rampart of volcanic rocks, and are at a considerable elevation above the level of the sea. From the S. shores the country rises gradually for some miles, then exposure a kind of upland, with the Caflers. Its surface is a succession of small plains, rising above one another and intersected by hillocks. At the S. extremity this plain is 3600 ft. above the sea, but
where it joins the plain of Cilao, towards the S.E. volcanic region, its elevation may be nearly 5600 ft. Its soil is entirely composed of triturated lava and other volcanic matter: a great part of it is without any kind of vegetation; in some places there are shrubs, but no trees. To the N. of it extends the plain of the Palmists, which rises to about 3000 ft. In the S.E. it is often called Le Cap Frere, for it is formed of coral, raised on all sides, except towards the shores on the N., by a nearly perpendicular wall of mountains from 1500 to 2000 ft. elevation, which are partly covered with high trees and rich vegetation: on the plain itself many trees are found, among which the species of palm is abundant, from which it derives its name. The descent to the shore is somewhat longer than on the S. declivity of the island. The traveller ascends from the plain of the Caffres to the S.E. volcanic region by two other extremely sterile plains, those of Cilao and of the Soudes (aux Sables).

This volcanic region at the S.E. extremity, which probably does not occupy more than one-seventh of the island, is called the burned land (pays brûlé), from its soil being entirely composed of recent lava. There are few places in which signs of vegetation are seen. Nearly in its centre is the present crater of the volcano, which nearly every year changes its place over an extent of 5 to 6 sq. m. This present centre of volcanic activity is only from 5 to 9 m. from the S.W. extremity of the island, and the high mountains near it rise to an altitude of about 1500 ft.

The eruptions of this volcano succeed one another at short intervals.

A soil so arid as that of Bourbon could not maintain a vigorous vegetation if it were not continually supplied with solid and liquid nourishment, viz. rain and sea-breezes. The first, blowing from the high mountains of the interior, are always cool, frequently cold; and in the gorges they blow with great force. The wind is sometimes felt from five to eight miles from the shore. It cannot pass into the valleys, but finds its way out from Jupiter's windows. During the N.E. winds, from January to April, the rains are still more frequent, and often continual for many days, and very heavy. But in spite of this humidity of the air, the climate is pleasant and healthy. During the winter, from April to August, the highest peaks are covered with snow. Hurricanes occur twice or thrice a-year.

The interior of the island is not inhabited, and perhaps not habitable, on account of the sterility of its soil. The cultivated ground in no place extends more than 5 or 6 km. from the sea. Within these limits are cultivated 7000 acres of land by sea-breezes, which brings with it fog. These fogs are afterwards dissipated by the rays of the sun, and driven again to the sea. This circulation of the vapours produces a great humidity, and rains are consequently frequent, especially during the N.E. winds, from January to April. The interior of the island is not inhabited, and perhaps not habitable, on account of the sterility of its soil. The cultivated ground in no place extends more than 5 or 6 km. from the sea. Within these limits are cultivated 7000 acres of land by sea-breezes, which brings with it fog. These fogs are afterwards dissipated by the rays of the sun, and driven again to the sea. This circulation of the vapours produces a great humidity, and rains are consequently frequent, especially during the N.E. winds, from January to April. During the N.E. winds, from January to April, the rains are still more frequent, and often continual for many days, and very heavy. But in spite of this humidity of the air, the climate is pleasant and healthy. During the winter, from April to August, the highest peaks are covered with snow. Hurricanes occur twice or thrice a-year.

Hurricanes occur twice or thrice a-year.
or 403,200 acres, and is subdivided into 8 cantons and 73 communes. The pop. in 1832 was 115,988.

**Bourbon L'Archambault,** or **L'Archambault,** in the dep. of Allier, and near the little river Barge, a feeder of the Our, is the seat of the Allier. It is about 160 or 162 m. S. by E. of Paris in a straight line, or 197 m. by the road to Fontainebleau, Montargis, Nevers, and Moulins. It is in 46° 36' N. lat. and 3° 1'E. long.

This town appears to have been known for its mineral waters to the Romans, who called them the baths of Aquae Boromisia. It was a place of some importance in the eighth century, for in the wars which Pepin le Bref, father of Charlemagne, carried on against the duke of Aquitaine, Bourbon is mentioned as one of the places taken by him. In the old time it was known by the name of Bourgo or borou (bourbe) contained in its waters, or perhaps from a deity called Borvo [Bourbonne les Bains]. About the tenth century Charles le Simple granted Bourbon, with the surrounding district, to a favourite of his named Aymard; and his successors bore the name of Bourbon, having, in most cases borne the name of Archambault, that name being attached to the town itself (Dictionnaire Universel de la France). Others make the origin of the lordship of Bourbon to have been a century later. By marriage this lordship came to the house of Montferrand, of which the last descendents failed in the early part of the sixteenth century, and the family was extinguished by the marriage of the heiress to the count of Montpensier, who assumed the title of duke of Bourbon. [Bourbon.]

The town of Bourbon is in a beautiful and rich valley or hollow, between four hills, a few miles from the left bank of the Allier; but the air is considered far from wholesome owing to the neighbourhood of a marshy pool, and the situation of the town in a hollow, surrounded by steep hills. On one of the hills is the ruin of an ancient castle of the sire or dukes of Bourbon; the ruin consists of three towers in perfect state, and the remains of a chapel, which has been the chapel of the dukes of Bourbon, and an appendage to the castle, is remarkable for its beautiful stained glass windows. The town depends mainly on its mineral waters, which attract a number of invalids, who resort here to find relief from rheumatic and paralytic attacks. The waters are contained in three wells, and have a temperature of 58° to 60° of Réamur, or 162° to 167° of Fahrenheit. The season lasts from the middle of May to the end of September. The celebrated Madame de Montespan, mistress of Louis XIV, died here in disgrace, if not in exile. The pop. is given in round numbers by Malte Brun and Balbi at 3000.

The river Barge, near which the town stands, seems to expand into a marshy pool. It abounds in fish.

Bourbon Lancy, like the town above mentioned, was known to the Romans for its mineral waters. It appears in the Theodosian table under the name of Aquae Nisinei. It is supposed to have derived its distinguishing epithet of Lancy, or as the geographers of seventy years since wrote it, Lancia, from a river which flows past the place, who was named Ancellus or Ancele; otherwise Ancseaume or Ancelme.

The baths, which give to this town its chief claim to notice, are in the suburb of St. Leger. There are several springs, seven according to some authors [Expilly; Dictionnaire Universel; Encyclopédie Méthodique], nine according to the modern statement of M. Robert (Dictionnaire Geographique, Paris, 1818); of which nine, one is very cold, the rest warm, the temperature being about 50° of Réamur, or 140° of Fahrenheit. The great bath is that of 74 English feet, or according to Reichard only 42 feet in diameter, paved with marble, and capable of containing 500 persons. Near this is a large square bath, built for the poor. The waters are described as being limpid, tasteless, and without smell; so that they may be used in making bread; yet they are said to contain sea-salt, sulphur, and bitumen. They are used in nervous and rheumatic affections. It is remarkable that although the great bath, which is a Roman work, has continued to the present day, the springs fell into neglect and oblivion. In 1580 they were restored to the public by the initiative of the Duke of Bourbon, which was brought into notice and the bath re-established by Henry III. The war of the league interrupted the improvements going on, which were however resumed and continued by Henry IV. and Louis XIV. Many remains of antiquity, statues, medals, and the relics of antient buildings, have been found in the mound which was raised about the place. The site is given by Malte Brun at 2500 in round numbers. Visitors come hither in spring and autumn, and seldom stay above a month. (Dictionnaire Universel de la France; Malte Brun; Expilly, &c.)

BORBOURNE-LES-BAINS, a town in France, in the dep. of Haute Marne. It is in 45° 56' S.E. part of the dep. and at the confluence of the small rivers, the Borne and Apanse, which latter riv. is a tributary of the Saône, 165 m. in Brun's map of France, or 170 in that published by the Keppel for the Diffus. of Useful Know., in a direct line S.E. by E. from Paris; or 179 m. by the road through Provins, Troyes and Chaumont-en-Bassigny: in 47° 56' N. lat. and 5° 46' E. long.

D'Anville considers this town to be known to the Romans, and that it is marked in the Theodosian Table by the name of Borbonae. It is not certain what the name is used to indicate mineral waters; though no name is extant as applied to this place. A Roman inscription has been found here which D'Anville says was sacred, Boronii et Monae Deco; and from this he has given to the place the name of Aquae Boronii. (Dictionnaire de l'Acad.) The inscription is however given by Expilly at full length, as follows:—

**BORONI THERMAE DUM MOAMMONE CALATINUS ROMANUS IN GALLIA**

**PRO SALUTE**

COCCILE UXORIS HIBUS EX VOTO EREXIT.

From this mention of Borbo or Borbon, as the presiding deity of the baths, it is likely we may deduce the etymology of the name of Bourbon. It is the more correctly than is commonly done, [Bourbon L'Archambault.]

In the beginning of the seventh century, a castle was built here which to an antient writer gives the name of Vervona; but it does not appear that any historical interest attaches to Bourbonne. In 1717 the town was burnt almost entirely, and the ancient castle shared the same fate.

The town stands on a declivity, and presents little that is pleasing in its aspect. It would not claim notice except for the cloisters and church of the antient monastery, to which the springs varies from 30° to 45° of Réamur; or about 100° to 140° of Fahrenheit, (Malte Brun); or to 62° of Réamur, or 172° of Fahrenheit. (Encyclopédie Méthodique.) Although too hot for one to bear the finger in them, they are drunk without scalding the mouth. (Malte Brun.) There appear to be three baths, or rather three establishments of two baths each, called Le Bain du Seigneur, from having formerly belonged to the lords of the soil; Les Batins des Fauves; and Le Bain Patrice. (Expilly, and Dict. Universelle de la France.) The waters are said to be good for gout, rheumatism, scurvy, gravel, venereal complaints, palsy, and nervous affections; also for gun-shot wounds. They are taken by drinking and bathing; and the very mud or sediment is said to be serviceable used as a poultice.

The season includes June, July, August, and September.

The military hospital contains more than 500 beds. The pop. of the town is given in round numbers by Malte Brun at 8500; and by M. Balbi at 4000. There are some pleasant promenades. (Malte Brun; Expilly; Reichard's Descriptive Road-book of France.)

BOURBONNOIS, a district of Central France, one of the thirty-two provinces or military governments in which, before the revolution, that kingdom was divided. It was bounded on the N. by Berry and the Loire; on the E. by Bourgogne or Burgundy; on the S.E. by the Lyons, and on the S. by Auvergne; on the S.W. by La Marche; and on the W. by Berri. Its form was very irregular: the greatest length from W.N. to E.S. was 92 m., and the greatest breadth was 56. The greater part of it is included in the dep. of Allier.

The province was separated from Bourgogne partly by...
BOURCHIER, JOHN. [BREWER, LORD.]

BOURCHIER, or BOURCHIER, THOMAS, archbishop of Canterbury in the successive reigns of Henry VI, Edward IV, Edward V, Richard III, and Henry VII, son of William Burchier of Canterbury, and grandson of Anne, daughter of Thomas of Woodstock, sixth son of Edward III. His brother was Henry, Earl of Essex. He received his education at Oxford, and was chancellor of that University from 1434 to 1437. His first dignity in the church was the deanship of St. Martin in London, from which he was advanced by Pope Eugenius IV. to the see of Worcester. In 1436 he was elected by the monks of Ely bishop of that see, but the king refusing his consent the election was not complied with, and the see continued vacant until the Papal bull of his appointment Burchier was translated thither. In April, 1454, Burchier was elected archbishop of Canterbury; and in December following received the red hat from Rome, being created cardinal-priest of St. Cyræus in Thermis. In 1456 he became lord chancellor of England, but resigned that office in October following for four years.

Several acts of Cardinal Burchier's life were memorable. He was one of the chief persons by whose means the art of printing was introduced into England. He was the person who, assisted by the generous presents of the principal city of Gloucester, persuaded the queen to deliver up the Duke of York, her son; and he performed the marriage ceremony between Henry VII. and Elizabeth of York.

He died at his palace of Knowle near Sevenoaks, on the 30th of June, 1454, and was buried in the church of Canterbury, where his tomb still remains on the north side of the choir near the high altar. It cannot be unknown to our readers that the archbishops of Canterbury and York, and the bishops of Durham had amply the privilege of coinage money. A half-groat of Edward IV. struck at Canterbury during Burchier's præmacy, has the family cognizance, the Bourchier knot, under the king's head. This is unnoticed by any of the writers on English coins.

(Wharton's Anglia Sacra, tom. 1, p. 63; Bentham's Hist. of the English Church, vol. ii, p. 156, &c.)

BOURDALOUE, LOUIS, was born at Bourges, Aug. 20, 1632, and professed among the Jesuits on Nov. 30, 1648. Having lectured successively in grammar, rhetoric, humanity, and moral philosophy, with considerable reputation, he was afterwards made a sub-dean in the cathedral church at St. Louis at Paris in the year 1669. It was not long before Louis XIV. became a personal attendant upon his sermons, which were heard with undiminished delight by overflowing congregations in the seasons of Advent and Lent for four-and-twenty years. After the revolution of the edict of Nantes, Bourdaloue was despatched, in 1666, on an especial mission into Languedoc, in which province he produced a deep impression, chiefly at Montpellier. His latter years were principally devoted to charity sermons, and he continued the habit until his death, which occurred in a few days before his death, which occurred on May 13, 1704. His sermons have often been reprinted. They abound more in sound reasoning and theological learning than in oratorical power, and they are better suited to the chastened taste of Protestantism than the efforts of most other celebrated French divines. It has been said with more justice than usually belongs to antithesis, that Bossuet is sublime from elevation, Bourdaloue from depth of thought.

BOURDON, SEBASTIAN, one of the most eminent painters of his school, was born at Montpellier, in 1616. His father, a painter on glass, instructed him in the elements of his art. At the age of seven, a relation took him to Paris and placed him under an artist of no great ability; but the genius of the pupil supplied the deficiencies of the master. While yet a boy, being in want of other employment, he enlisted in the army. Luckily his commanding officer possessed taste enough to discern the natural power of the young artist, and he gave him his discharge. At eighteen he passed into Italy, where he made acquaintance with Claude Lorrain. He remained there but three years, being obliged to leave the country in consequence of a quarrel with a painter, who threatened to seduce him from the path of his parents. In 1641, he went back to France, and began to study the ancient masters, first himself in practice, studying, and imitating the works of Titan, Poussin, Claude, Andrea Sacchi, Michel Angelo delle Battiglie, and Bamboccio. So retentive was his memory, that he copied a picture of Claude's from recollection; a performance which astonished that great master as much as any who saw it.

On his return to France, Bourdon received some instruction from Du Guerrier, a miniature painter in great repute, whose sister he married; a connexion which procured him better employment. After a settlement in the French collections, he was broken in by the civil wars in 1659, he went into Sweden, and Christina, who then occupied the throne, appointed him her principal painter. In this capacity he executed many pictures, and among them a portrait of his royal mistress on horseback. While he was at work upon it, the queen took occasion to mention some pictures which her father had become possessed of, and desired him to examine them. Bourdon returned a very favourable report of the collection, particularly of some by Correggio; and his generous patron promised to send him over the works of Titian and Tintoretto; but however, with no less generosity, declined the offer; saying that the pictures were among the finest in Europe, and that she ought not to part with them. The queen kept them accordingly, and taking them to Rome with her after her abdication, they ultimately found their way into the Orleans collection for five years.

When Christina vacated the throne, Bourdon returned to France, which had become somewhat quieter, and employment offered itself in abundance. At this period he painted the ' Dead Christ in Aisie,' which is the most perfect of his two of his most famous pictures. He does not appear, however, to have ever amassed any sum of money; for while on a visit to his native place, an admiring tailor made him a suit of clothes, with a red cap, and sent them to his master; and another kind gentleman, a painter, loaded Bourdon with a box of pictures, and a fine portrait of himself dressed in the clothes, with his friend the bearer by his side. Being much pleased with his success, he had not the heart to send the picture to the munificent tailor, as he had intended, but he made a copy which he gave him instead. In 1648 he assisted in forming the Royal Academy of Painting, and was elected its first rector. He died at Paris in 1671, aged 55. He had some daughters, miniature painters, who survived him. Guilbert, M. and F. Varouze, and Nicholas Loir, were his pupils.

Bourdon had a most fertile genius, an ardent spirit, and great facility, which enabled him to indulge too much in a careless mode of study. He had no fixed style of painting, but followed his own caprice, imitating many; and he excelled equally in all kinds, history, landscapes, battle-pieces, and comic subjects. His colour is fresh, and his touch light and sharp; his expressions lively, and his invention ready; but his drawing is hurried, and his extremities modelled with great carelessness. He did not finish highly; nor are his most finished pictures his best. His execution was so rapid that he is said to have completed by his own mind his own thoughts after nature, and the size of life, in a single day; and they were esteemed equal to some of his best productions. This surprising facility enabled him to enrich his landscapes with some of the most singular and happy effects from nature. When a second time he had studied the landscapes of France, his great attention, and his admirers trace some of the beauties of the Venetian in his landscapes; they partake also of the style of Poussin, and have a wildness and singularity peculiar to himself. (D'Argenville; De Piles.)

BOURG, the name of several towns in France, of the principality of which we subjoin an account. The word denotes 'town, like our own borough or borough [Borotou, Boros], and in France is applied especially to smaller places which do not take the title of ville.'

Bourg-en-Bresse, also Bourg-en-Bresse, from its situation in the district of Bresse, a subdivision of the Duchy of Bourgogne [Bourgogne, Bresse], is on the river Reysseau, a small tributary of the Saône, about 230 m. in a straight line S.S.E. from Paris, or 266 m. by the road through Auxerre, Autun, Chalon, and Maren;
and 50 m. by the road N.E. of Lyon. It is in 45°13'11" N. and 5°12' E. long.

M. de Thou, in speaking of a siege which this town sustains, says ( Hist. des gens de Savoie, tom. II. p. 181; and M. Malte Brun, following, it is likely, M. de Thou says, that in the 4th century it was called Tanus. D'Anville, however, does not fix my town upon the site of Bourg; nor does he notice Tanus; and Forum Segusianorum is, according to the maps of Loire. It seems, then better to prefer the account given by Longueville (Description de la France, Ancienne et Moderne, liv. iii.), that Bourg was founded by the lords of Baugé or Bagé, formerly capital of Bresse, and that it does not appear to have been of earlier date than the 10th century; about which time the name appears in several records. Guy, last lord of Baugé, and marquis of Bresse, granted to Bourg the privileges of a free town, in consequence of which the place increased and became of some importance under the government of the counts and dukes of Savoy, to whom Bresse came by marriage in the 13th century. In 1556, or 1558, the then reigning duke of Savoy, Emanuel Philibert, caused a strong citadel to be built at Bourg, on a height, which, however, was demolished by order of the regent Mary of Medic, mother of Louis XIII., about ten years after Bresse came under the treaty of Lyon) into the hands of the kings of France.

The town, which is in an agreeable situation, is adorned with some handsome buildings and fountains, and farther embellished by promenades. It has a church of beautiful Gothic architecture, which has been raised to the dignity of a cathedral: previously to the revolution it was a collegiate church. There were in the town three monasteries for Jacobins, Capuchins, and Cordeliers; three nunneries, of the orders of St. Clara, St. Ursula, and the Visitation; and two hospitals, for the poor, one attended by the Nuns Hospitalières, and one for poor girls. There was a college once in the hands of the Jesuits. There was also, in 1804, the ruin of an old castle of the dukes of Savoy, used as a prison. The town possesses a college, or lycée, which has been (by the treaty of the Congress) given to the congregation of philosophical instruments; also an agricultural society. The manufactures consist of coarse woollens, silk stockings, leather, and clocks and watches, but the latter is not flourishing. An older authority (Dictionnaire Universel de la France, 1804) adds to these articles, linen, lace, hats, and combs. The chief trade is in corn, cattle, horses, and the articles of manufacture above mentioned. Its situation, remote from any navigable river, prevents it becoming a place of much commerce. The pop. in 1832 was 7826 for the town, 4889 for the village of Brou, which is once in the episcopal list. In 1515 Bourg was, by a bull of Pope Leo X., made the seat of a bishopric. The bull was, however, revoked in 1516. In 1521 the town was again raised to an episcopal rank; but in 1536 the bishopric of Bourg was finally suppressed.

The arrond. of Bourg contained, in 1832, a pop. of 117,289 persons. Close to the town of Bourg, in the village of Brou, is a church once remarkable for its fine monuments of the family of the Dukes of Savoy; but they were destroyed during the French revolution. Seglav, a French writer, of some note, and the astronomer Lalande, were natives of Bourg. [Martinière; Expilly; Robert.]

Bourg, called also Bourg-sur-Mer, a town and port in the dep. of Gironde, near the confluence of the Garonne and Dordogne, is a triangular town, a port, and city of the Garonne, which is formed by their united streams. It is about 10 m. above Blaye, which is on the same bank of the riv., and about 15 m. below Bourdeaux, following the course of the Garonne.

This is an ancient town. Sidonius Apollinaris, in the 5th century, speaks of it under the name of Burgus, and has written a poem of above 230 lines upon it. It is, however, now inconsiderable. Its chief trade is in the export of the wines of the neighbouring district. Our latest authority (Glotz, History of Bordeaux, 1822) claims for it the appellation of Port de la France (1804), which gives it at 2200. The hills in the neighbourhood of Bourg yield a greyish white stone (gris-blanc), which the inhabitants call bastard marble. Though far inferior in hardness to marble it will take a polish.

Bourg-Argental, a small town in the dep. of Loire, near the border of the dep. of Ardèche. It is close to the little riv. Dauje, which flows into the Cance, a feeder of the Rhône.

Some lakes and cramps are made, and silk of dazzling whiteness is prepared here. The pop. in 1832 was 1734 for the town, or 2502 for the whole commune.

This town is not of very high antiquity, but was once more considerable, and it is said to be built upon the site of a more ancient town, Manto, which was destroyed by fire in 16th century. In 1656 it was much injured by the Calvinists, who also attacked it in 1598, when it had scarcely recovered from the effects of famine and pestilence, which had nearly depopulated it in 1655 and 1656. The attack was, however, repelled by a solemn annual procession long commemorated the defeat of the assailants. In 1589 it was taken from the party of the League, in whose hands it then was, and pillaged by the duke of Ventadour; but he was driven from it in 1591 by the Duke of Mayenne, who Duke and finally took over the League. It had a castle, which was demolished in 1595. (Malte Brun; Expilly.)

Bourg Désols, or Bourg Dieu, a town very near Châtelauroux, of which it may almost be regarded as a suburb. It is however on the other side, viz., the right bank of the Indre. It was once a place of importance, and capital of the principality of Dols. The town appears to have had, at one period, three parish churches and a castle, which in the 10th century Raoul de Dols gave up to the monks of an abbey which his father had founded; and erected for himself a castle at Châtelauroux, in the immediate neighbourhood. The abbey flourished exceedingly; and although it fell into ruin at a subsequent period, yet the remains of the buildings were sufficiently superb to show the munificence of its former abbots. Of the three churches, one, which was a part of the building remained in occupation; and the three par. churches had been reduced to one. The pop. in 1833 was 1792 for the town, or 2113 for the whole commune. (Cha-

Châteauroux.]

Bourg d'Oisans or d'Oyane, a small town in the dep. of Isère, on the road from Grenoble to Branson, and close to the riv. Romanche, which flows into the Drac, a feeder of the Isère. There is a lead mine in the neighbourhood, and gold is also found. (Bryen. Method.) The pop. of the com-

This little town is seated in a valley in the midst of the mountains, which, branching out from the main chain of the Alps, cover a considerable portion of the dep. Traveling from Grenoble towards the town, there is yet to be seen the dyke of the Lake of St. Laurent, which once covered this valley in its whole extent. The following account of this lake we translate from the Itinéraire Description de la France of M. Vaysse de Villiers, quoted in Malte Brun's Geographie Universelle (3me. ed.).

The town and surrounding district is the extreme of two centuries to one of the most terrible accidents to which the valleys of the Alps are exposed. Two rapid streams (torrens) rush opposite to each other from the summit of the mountains into the Romanche, at the very spot where this riv. quits the large hollow (côte) of Gap (Gap), and the dep. of D'Oisans. These two streams suddenly swelled, in the 11th century, to such a degree as to carry with them to the bottom of the valley an immense quantity of rock, earth, and gravel, which uniting from the two sides, at last closed up the valley, and the waters of the Romanche retained by this dyke, rose to the level of it, covering all the valley to the depth of 60 to 80 (French) ft. A relic of the bridge, which may be seen on the road that leads to the Bourg d'Oisans, still points out to travelers the depth of the lake, and conse-

The violence of these two streams, and the descent of the mountain, gave the lake its height of 80 ft. From its nature, it was nature which destroyed it:—the waters of the lake, which had been undermining it for a long time, at length burst through it, in the 15th century (in Sept. 1292), and rushed impetuously over into the valley below, and filled the then lake, which occupied the whole of the Isère. They carried with them all the villages and all the houses which lay in their course, and flooded the city of Grenoble. There was nobody saved except those who had time before the flood came on to take refuge either in the hollows, or in certain caves judgement, which had been made deep enough. After all the bridges were overthrown. The first accident had buried the plain of Oisans; the second raised it from its grave. But the catastrophe which overwhelmed it may occur again; the cause always exists, and may, at any moment, lead to the same evil result. The violence of the two streams, and the debris of the mountains which they bring with them, may again close up the valley, by opposing a new barrier to the Romanche, and form a new lake, which,
in like manner, could only find an outlet by rising to the
height of a larrikin.'
Bourg St. Andoël, otherwise Bourg-sur-Rhône, a town in the
former district of Vivares in Languedoc, and now included
in the department of Ardèche. It is on the right bank of the
Rhône, about midway between Viviers and Le Pont St. Esprit, in 14° 17' 50" W.
It is named after its saint, St. Andoël, who suffered martyrdom
in the reign of Septimius Severus, at the commencement
of the third century. It was, before the Revolution, the usual place of residence of the bishop of
Viviers, and had a seminary for the education of the profes-
sion, which was said to be a good estimation. The relics of St.
Andoël were said to be preserved in the par. church.
The tomb which was shown as his was however of pagan
origin. This town is situated at the mouth of a small
stream, which flows from the mountains of the Vivarais, and
through a part of the Rhône. It carries on some trade by
the river. Pop. in 1832, 3782 for the town, and 4268 for
the whole commune.
Near Bourg St. Andoël is a remarkable monument of
antiquity, a bas relief, which seems to have been consac-
rated to the god Mitra, or the sun. It is carved on the
face of a calcareous rock, from which a mineral water
flows; and beneath it is an inscription in Latin almost
officiale. The bas relief is also much defaced; but there
may be distinguished a bull which a deity seems to attack,
the figure of Mitra, and a human figure in the act of attack else-
where, and a man is apparently about to sacrifice him.
Above this group is a figure surrounded with rays and sup-
posed to represent the sun, from which, as well as the in-
scription, the destination of the monument has been
ascertained and it represents the moon.
The whole of the bas relief is included in an oblong square,
about four ft. and a quarter high, and nearly six ft. and a
half wide. The inscription, if the many gaps in it have
been rightly filled up, is a dedication of a monument
dedicated to Mitra, by Maxammas as well as Menumus.
The worship of this deity had been introduced at Rome by the
soldiers of Pompey on their return from the East, and from
thence it spread into the provinces. The monument is
supposed to be of the third or fourth century. (Millin,
Topographie de la Midi de la France.)
Bourganeuf, a town in France in the dept. of Creuse, not far from the left bank of the riv. Thordon, a
feeder of the Vienne, which is a tributary of the Loire. It
is 206 m. from Paris by the route from Limoges.
Bourganeuf is in 45° 57' N. lat., and 1° 44' E. long.
The town contains a tower of considerable height built
for Zizim or Djim, son of Mahomet II., and brother of
Bajazet II., emperors of the Turks. This prince, after
having been defeated by his brother, put him to death and
put him in the possession of the throne, took refuge
with the grand master of the Knights Hospitalers, who
were then settled at Rhodes. By virtue of a treaty with
Bajazet, in which the grand master stipulated carefully to
death his guest, Zizim was supported in the same place
and detainted in different castles. Among the other places
at which he sojourned during his captivity was Bourganeuf,
which was the residence of the grand prior of the Orde
of the language of Auvergne. Here he was twice
deated; and the tower above mentioned was built for him during his
sojourn in this place. It is six or seven stories high, and the
walls are so thick as to admit of a spiral staircase being
made in them. In the lowest story are the baths which
were constructed either by the prince, or out of regard to
his eastern habits by those who had charge of him. (Ex-
plicitely, art. "B.)
Bourganeuf has two manufactories of porcelain, and one
of paper. Tiles are also said to be made here. The pop.
in 1832 was 2110 for the town, and 2849 for the whole
commune.
The town is the capital of an arrond., which in 1832 con-
tained a pop. of 37,965 (Malte Brun.)
Bourgeois, Sir Francis, was the descendant of a
family of respectability in Switzerland, where, it has been
said, many of his forebears were suspected of
considerable truculence. He was the father of Sir Francis
banks, who was said for several years in England, it is believed, under
the patronage of Lord Heathfield; and Francis was born
in London in 1756. His early destination was the army,
but having been instructed, while a child, in some of the
rudiments of painting by a foreigner of inconsiderable merit as
a painter of horses, he became so attached to the
study, that he soon relinquished all thoughts of the military pro-
fession, and resolved to devote his attention solely to painting.
For this purpose he was placed under the tuition of
Loutherebourgh; and from his having connections and
acquaintances access to many of the most distinguished col-
gnors in Europe, he owed the introduction to the best so-
ciety and most valuable repositories of the arts. At his
return to England Bourgeois exhibited several specimens of
his studies at the Royal Academy, which obtained him
reputation and patronage. In 1791 he was appointed
court painter to the Prince of Wales; an eminence, to
primate, had been much pleased with his performances
during his residence in this country; and at the same
time he received the knighthood of the Order of Merit, which
was afterwards confirmed by the king of England, who in
1794 appointed him his landscape painter. Previous to
this he had, in 1794, been elected a member of the Royal
Academy.
As a painter Sir Francis cannot be very highly esteemed.
While his pictures display a feeling for nature, they equally
evince the want of power to express it on the canvas; his
subjects are often beautiful, as a scene; but his style of
work is very imperfect, and he is otherwise very deficient.
On the other hand, his drawing is tame and lifeless, his colour-
lessness is generally and monotonous, and his touch heavy;
and though there is an appearance of labour in the process,
the result is ill done and unfinished. He very closely imitated
the manner of his instructor.
It is as the bequestor of the Bourgeois collection to
the custody of Dulwich college, for the use of the public, that
he has most claim to our gratitude. The collection was
formed by Noel Bourgeois, an eminent picture-dealer, who
dying left it to Sir Francis, with a request that it be held in
close friendship. Sir Francis, at his death, left it to the
widow of his friend, with the greater part of his property,
for life; bequeathing 2000L to Dulwich college for the
purchase of building a gallery for the pictures, the
reversion of which to his widow, and also that the property, charged with expenses of preserving the pictures,
and altering and enlarging the chapel. Desenfans had been
interred in a chapel attached to Bourgeois's house;
but Sir Francis desired in his will that their bodies might
be removed and deposited together in a mausoleum in
Dulwich college, which was accordingly done.

The college was founded by an act of the name of
Alleyne. (Alleyne.)

The Dulwich gallery, as it is generally termed, comprises
upwards of 300 pictures; they are mostly of a cabinet size,
and, being in a dim light, and many of them hung some-
what high, they are not seen to the best advantage.
The collection however is a fine one, and contains some of the
most beautiful specimens of Poussin, Cypri, Rembrandt,
Murillo, Zuvreranius, besides other masters (Lysons's
Enquiries; Gentleman's Magazine for 1811.)

Bourg in France, a city of France, capital of the dept. of
Cher. It is situated at the junction of the Arvon with the
Eure, or as it is written in more modern maps Levertre;
whose name, amongst others, was confounded with that of
the Cher, one of the great feeders of the Loire. This
city is indeed situated close to the junction of many streams,
for the Lavrete receives the Collins, the Langa, and
the Moulin, either in or just above the town; while the
Arvon receives the Careau, and in the Arvon itself, and
is 120 m. in a straight line due S. from Paris, or 131 m.
by the road through Montargis, or 144 through Orleans. It
is in 47° 5' N. lat., and 2° 33' E. long.

This city may vie in antiquity and ancient importance
with almost the capital city of France. It is the seat of
a branch of the Bituriges which was known, according
to Strabo, Ptolemy, and Pliny, by the surname Cubi,
whereby it was distinguished from the Bituriges Viviscii,
a branch probably of the same stock which had settled on
the upper river. Certainly the bank of the Arvon, whose
capital was Burdegalae (Bordeaux). The Bituriges,
according to Titus Livius (Historiar. v. 34), were the
dominant tribe in Gaia Celtica as early as the reign
of the Roman king Tarrminis Priscus; whilst their king
Ambitugis sent out two immense host of emigrants under
his nephews Belenus and Sigevogus, the former into the
north of Italy, the latter into the vast Hercynian forest,
where he ruled as a semi-autonomous chieftain. Later,
he moved to Germany, Hungary, and Poland. In the time
of Caesar they had lost their supremacy, and the Bituriges
Cubi were themselves under the protection of the Alodii.
At that period their capital, the Gallic name of which,
as latinized by Caesar, was Tungovia, was not under
their own administration, but in Caesar’s time it was a place of importance. In the struggle with the
Romans, at the head of which was Vercingetorix, near
the close of Caesar’s proconsulship, the territory of the
Bituriges became the seat of war. Agreeably to the de
novo recognition of many of the names upon the approach of Caesar’s
army, above twenty towns of the Bituriges were taken
up by the flames, and in a general council it was debated whether
Avaricum should be burnt or defended. The Bituriges fell
at the feet of all the Galli, and begged ‘that they might not be
compelled to see fire in their own hands to that which
was almost the kindliness of all Gallia, and which was
ornament of their state. They declared they could easily
defend themselves from the advantage of the situation, for
the place being surrounded on almost every side by the
river or a marsh had but one entrance, and that very
narrow.’ Contrary to the opinion of Vercingetorix, whose
sounder judgment wished to continue the defensive warfare
which they had begun, but who yielded at last to their in
treasures, and to the general commiseration excited by them,
it was resolved that a stand should be made at Avaricum,
and Vercingetorix was the general and garrison was selected. (Cæsar. de Bell. Gall. lib. vii. c. 15.)

Cæsar lost no time in forming the siege of the place;
and notwithstanding Vercingetorix pitched his camp about
15 Roman m. off, and afterwards even nearer, he carried on
his operations with his usual activity, and the garrison
counteracted his efforts with considerable skill, being,
as Cæsar described them, ‘a people of very great in
vaginity, and very ready in the imitation and carrying into effect of any plans which they may acquire from others.’ They diverted the attack of the Roman machines, under
mined their works, raised their own walls higher with
wooden towers covered with hides, so as to keep pace with the
towers which the Romans built to assail them, inter
rupted the operations of the Romans or set fire to their
works in constant daily and nightly sallies, and retarded
the continuation of the trenches (apertas cucunae) up to
the walls of the town. These walls of the town were con
structed, with considerable art, of alternate layers or courses
of wooden beams and of stone, so as to form a secure
defense, not only against the cannonading of the besiegers
by fire, and the wooden beams deadening the shock of the
battering ram. In 25 days the Roman works had made
considerable progress, when the besieged managed to
undermine and set fire to the mound (augger) which Cæsar
describes as being 30 m. high, and agreed to be taken by
the garrison, which, however, after a most obstinate
struggle, was driven again into the town. The garrison in
despair now determined on abandoning the place, and it was
only when the women, who besought them not to forsake
them, gave notice of the design to the Romans by their
cries, that they desisted from their purpose. The following
day Cæsar observing that the walls were not so watchfully
guarded, ordered a general assault, and thus carried the
town. The Romans had been exasperated by the massacre
of some of their countrymen being killed by fire, and by
the tokens of the siege; they spared neither age nor sex;
old men, women, and children, were involved in indiscriminate slaughter; and out of 40,000 persons who
had been shut up in the town, scarcely 800 escaped to the
camp of Vercingetorix. (Cæsar. de Bell. Gall. lib. vii. c.
16-20.)

By what degrees Avaricum recovered from this dreadful
blow is not known. Malte Brun says, but does not quote
his authority, that Augustus made it the capital of Aqui	ania. It was improved and fortified by the Romans, and
became a city of considerable size and importance. (See
presently notice,) the seat of a bishopric. Of the walls of
the old town (which is comprehended nearly on all sides by
the new town) some parts remain: these are, as we gather
from a comparison of the different authorities, supposed to be
Bersama, or Bersali. The duke of Aquitaine, when Francis
I. of France married Elisabeth of Savoy, was the first abbess
and one of Cistercian nuns, supposed to have been founded in
the 12th century. Among the convents was one for
the Annunciation nuns, founded by the Princess Jeanne (Joan),
otherwise St. Jeanne, daughter of Louis XI., and of
the order of Cistercians. One of her daughters married a
Monsignor Malo, and she was known as the Mother Superior.
She: she was the instigator of the order of the Annunciation,
and the convent of Bourges was the first convent o
that order. Besides these institutions, which were in exist-

202
ence when Expilly wrote, there was one suppressed abbey of the order of St. Augustine, whose house or church of two collegiate churches had been united to the seminary for the priesthood. This seminary was under the direction of the religious of the Benedictine abbey.

There was also at Bourges a university of great repute and well frequented. It was founded by Louis IX. (St. Louis) King of France: but this is doubtful. It was re-established by Louis XI. in 1463. It comprehended the four faculties of theology, law, medicine, and arts. The front and last were four stories in the hands of the abbot. These edifices also had a cromlech of Bourges, one of the finest and most extensive in the kingdom. (Expilly, Dict.)

The revolution and the political convulsions that have followed since, have of course made considerable changes in this university, a college of chancellors, and in the general ravages of that stormy period, and is one of the noblest Gothic edifices in the kingdom, and indeed in Europe. It is the highest spot in the city; and its front, notwithstanding the irregularity of its architecture, is remarkable for the richness of its ornaments and the delicacy of its finish. The ascent to the front is by a flight of steps; and at each end of the front is a lofty tower. Five grand entrances occupy the front; and one of these is adorned with sculptures representing the last judgment. The inside dimensions of the court are: 650 feet in length, 500 feet in width, and 140 English feet for the width, without including the chapels. The vaulted roof of the nave and its side aisles are supported by Corinthian columns (Expilly) of great height and delicacy of workmanship. The town-hall was founded by Louisa, Queen of France, in the time of his presidency, who gave to the University of Charles VII. to re-conquer the country that had been subdued by the English in the reigns of Henry V. and VI. Having obtained of him considerable sums, that thankless prince caused or permitted his wife to be proscribed for imaginary crimes, or rather for acts that were not criminal, despoiled him of much of his wealth, and Cour ended his days in a foreign land. Colbert, the celebrated minister of Louis XIV., having come by purchase into possession of this house, gave it up to the nobility of Bourges, who made it the town-hall. The edifice is in the richest style of the architecture of the age in which it was built (the 15th century), and the walls alone are said to have cost 135,000 livres (5300 sterling), a vast sum for those days. The very chimneys are richly ornamented, and are built to resemble the towers and gates of towns. The walls are adorned with sculptures of shells and hearts; these are probably the arms of Jacques Coeur, which Expilly mentions as being carved in several places, and which, according to his hugging motto, A vaillant Coeur rien impossible. The building, of great magnificence: the garden attached to it is used as a public promenade, and contains an obelisk erected to the memory of Bethune Charost, a man whose unbounded benevolence, and whose services to the department of which Bourges is the capital, render him worthy of such a memorial.

There is also an ancient palace built by John duke of Berry, son of John II. of France, in the 14th century, or in the beginning of the 15th century. Since the revolution and the abolition of the privileges of the noblesse, the manufactories and commerce of Bourges have been increased, but not to any great extent, for the population has not much advanced. The Dictionnaire Universel de la France (1804) notices a manufactury of salt-petre, and three other manufactories, one of cloth, and one of linen generally; but Malte Brun affirms that there is not a linen manufactury in the whole department, though a great quantity of hemp is grown. The industry of the town consists chiefly in the produce of the country around, corn, wood, and divers kinds of stone quarried in the neighbourhood. The pop. in 1832 was 17,026 for the town, or 19,730 for the whole commune. The opening of the Canal de Berri which passes through the dep. of Cher, though at a considerable distance from Bourges, has increasedvery greatly to the commerce of this part of France. Bourges is the seat of an archbishopric. The diocese is very ancient. St. Ursin, said to have been the first bishop, lived about A.D. 252. The archbishop took the title and rank of patriarch, and primate of the provinces of Aquitaine. As patriarch he claimed jurisdiction over the archbishops of Narbonne, which were either resident orIMATE, over those of Bordeaux and Auch, metropolitan districts of the second and third Aquitaine. As metropolitan, he had at one time eleven suffragans, viz., the bishops of Alby, Cahors, Castres, Clermont, St. Flour, Limoges, Mende, Le Puy, Rodez, Tulle (in the diocese of). These have been raised to the rank of metropolitan, and the bishops of Cahors, Castres, Mende, Rodez, and Valence, made suffragans to him, there remained only five suffragans to the archbishop of Bourges, viz., the bishops of Clermont, St. Flour, Limoges, Le Puech Lozére. (Expilly.) These are still his suffragans. The diocese of Bourges includes the departments of the Cher and Indre. There are an Académie Universitaire, a Collège Royal, or high school, a seminary for the priesthood, and a school for music; besides a society of agriculture, of commerce, and of arts, a rich public library, a museum or art gallery, an historical cabinet, and a theatre. There is a Cour Royale, or high court of justice, the jurisdiction of which extends over the three departments of Cher, Indre, and Nièvre. Bourges is also the chief place of the fifteenth military division, which comprehends the several departments of Cher, Indre, Allier, Creuse, Nièvre, Haute Vienne, and Corrèze.

The situation of the town is pleasant. In the neighbour- hood there is a mineral spring, called the spring of St. Firmin, or the iron spring; and another in the Faviére St. Firmin, which is about 200 feet across, and is 18 feet above the gravel. The arrond. of Bourges had in 1832 a pop. of 97,537.

Among the eminent natives of Bourges may be men- tioned the celebrated preacher Louis Bouzidoulo, born here in 1632; Joseph de Fouchet, a military engineer; and characters of the Revolutions of England and of Spain, born in 1641 (both these were Jesuits); Jacques Coeur, already noticed. and the King Louis XI., by whom, as we have seen, the University of Bourges was founded or re-established.

BOURGOGNE (BOURGUIGNON).—The name of Bour- gogne is derived from the Bourguignons, one of the northern nations by whom the Roman Empire in the west was overthrown, and who established on the frontiers of France, Italy, and Switzerland, a kingdom of some extent, though not of long duration. As the account of this kingdom belongs to general history, and not particularly to French history, it is given under the article BURGUNDIANS, the usual English form of the name. The history and de- scription of the bailiwick of the Budal dynasty and province which inherited the same designation, we give, as belonging to French topography or history, under the French designation of Bourgogne.

General description of Bourgogne.—Bourgogne was of considerable extent and of very irregular form: its greatest dimension or length was from N.N.W. to S.S.E., from the neighbourhood of Bar-sur-Seine to the extremity of Bresse, in which direction it extended about 195 m.: the breadth, measured at right angles to the length, varied very much; the extreme east was bounded from near Bourgogne to the neighbourhood of Pontoux being about 90 m., and the least about 30 m. It was bounded on the N. by Champagne; on the E. by the county of Bourgogne, (usually called La Franche Comté.) Switzerland and Savoy; on the S. by Dauphiné; on the W. by Burgundy, (often called) the Bourbonnais, Nivernais, and Orléanais.

The country thus bounded comprehends portions of the basins of three of the principal rivers in France, the Loire, the Rhône, and the Seine. The W. part is watered by the Loire, the Saône, the Rhône, and smaller streams, which flow immediately or ultimately into the Loire, and by the Loire itself for a short distance; the E. part is watered by the Vienne, the Tille, the Ouche, the Dheune, the Doubs, or as it is written in maps of 70 m. and 80 m. since the days of Caesar; others, tributaries of the Saône, and by the Saône itself, a consid- erable part of the course of which is in Bourgogne; the N. parts include the source of the Seine, the sources of the Ouche, the Armançon, the Serein, and the Cure, all of which, and part of the course of the Yonne, ultimately unite.
with the Seine. The district of Bresse is bounded on the S. by the Rhône, and watered by the Ain which falls into the Rhône. These three basins are separated from each other by a range of hills which, entering Bourgogne from the E., runs nearly due N. to the neighbourhood of Château-Chinon, separating the basins of the Rhône and the Loire, and at Château-Chinon divides into two parts, one of which running N.W. separates the basin of the Seine from that of the Loire; while the other, the Côte d'Or, runs N.E. towards Langres and the Chain of the Voges, and separates the basin of the Seine from that of the Saône, or more properly the Rhône. Two important canals cross the country; one, Le Canal du Centre or du Charolais, unite the Seine at Chalon on the Loire and the Saône at Châtillon; the other, Le Canal de Bourgogne, unite the Saône at St. Jean de Losne with the Yonne, between Auxerre and Joigny, following very nearly the course of the rivers Ouche and Armançon.

Watered by so many rivers, possessing a fine climate and fertile soil, Bourgogne may be regarded as one of the districts of France most favoured by nature. Grain of all kinds is plentiful, vast numbers of sheep are fed in the pasturages, and the forests yield timber for the buildings and fuel. Henp, fruit, fish, and game, are plentiful; but the principal article of produce is wine, which is among the very best in France. The following wines may be mentioned as of the finest quality: the red wines of Auxerre, La Romaneé-Conti, Chambertin, Richelieu, Oudon; the white wines of Meursault, Pommard, Chapaize, Georges, Corton, Les Tourins, and Chenas; and the white wines of Puligny (growth of Monthrachet), Pouilly and Buissé. The wines of the district are known by the general name of Pon de Bourgogne (Burgundy wine). For further information, see Bourgogne and its productions, trade, etc., Bourgogne, see Aix, Aube, Côte d'Or, Saône and Loire, and Yonne, among which department this extensive and valuable territory has been shared. (Malte Brun, Dict. Univ. de France.)

Bourgogne has been considering it, was formerly divided into the prov. of Bourgogne properly so called, and the three dependent districts of Bresse, Bugey (including Valromey), and Gex. The prov. of Bourgogne was again subdivided into the duchy so called, (comprehending Le Dijonnais, L'Autunois, Le Châtillonnais, or districts of Dijon, Autun, and Châlons, L'Auxois, and Le Pays de la Montagne,) and the dependent counties of Le Charolais, Le Mâconnais, L'Auxerrois, and Bar-sur-Seine; which counties took their names from the towns of Charolles, Macon, Auxerre, and Bar-sur-Seine; (Garreau, Description de Gouvernement de Bourgogne.)

The principal towns of this important government, of which Dijon was the capital, with the river on or near which they stand, and their pop. in 1832, as far as we can ascertain it, we give for convenience sake, the towns of those two counties are given for the pop., the first list of the town itself (population agglomerée), the second that of the whole commune.

For an account of the above-mentioned places, we refer the reader to their respective articles, for the larger towns: the others, so far as they call for notice, will be found in the account of the departments of Côte d'Or, Saône and Saône et Loire.

The history of Bourgogne presents perhaps more points of interest than that of any other district in France.

History of Bourgogne—Celtic period—The Ædui—When Caesar invaded Gaul, Bourgogne, for the most part, was the territory of the Ædui, whose capital Bibracte, afterwards Augustodunum, was the modern Autun. Portions however were occupied by other tribes; as Bresse and Bugey by the Ambardi (dependents of the Ædui), and by a part of the Allerobres, and of the Santonians, which led people also occupied those portions of Chalonnes and Le Dijonnois, which were on the left or S.E. bank of the Arar or Saône. The Lingones possessed parts of Dijonnois, including Dijon itself, and of L'Auxois, and Le Pays de la Montagne; of the last-mentioned the Mandubii, a small tribe, part of the Auxois, and the Aulerci Brannovices part of dependents of the Ædui, the Brienneis, which is part of the duchy of Bourgogne.

Of these people, who were all of the great Celtic race, the Ædui were especially numerous, and inhabited the S.E. before Caesar's arrival, the head of one of those factions, into which, with a remarkable propensity to party division, the Celts were separated. Their principal rivals were the Arverni and the Sequani (who inhabited, respectively, the districts of Laon and Dijon), and the Auvergnats, who had the predominance so long as the contest lay between them and the other people of the Celtic race. Their power seems to have been confirmed by their alliance with the Romans, who had gradually subdued that part of Gallia which lay to the W. of the Seine and E. of the Loire, and further the Alps (the Cottian Alps). Shortly, however, before Caesar's arrival, the Arverni and the Sequani, desiring to make head successfully against the supremacy of the Ædui, determined to call in the Germani to their aid; and a large body of these, crossing the Rhenus (Rhine), utterly defeated the Ædui and their dependents in two battles, in which the vanquished lost all their senate, all their nobility and all their cavalry. The Ædui were compelled to give up hostages the chief men of the state, and to swear that they would never have recourse to arms against the Romans. (Cass. de B.C. i. 11, vi. 11, 12.) While in this depressed condition, the Helvetii (Swiss), the most warlike of the Celtic nations, with their allies, abandoning in a body their native country, set out for Gaul, and landed on the coast of Cottiae (the Cot tenge), where they determined to settle. Their road lay through the country of the Ædui, which they ravaged, without encountering any effectual opposition. The only hope of this wretched nation was now placed in their Roman allies, and they sent ambassadors to Caesar, who had just entered upon the government of the Roman provinces of Gallia Citerior, and Ulterior Illyricum (which comprehends the N. of Italy and the S. of France), pleading 'that they had always so conducted themselves towards the Romans that their hands had never been stained with the blood of their countrymen, and their towns burned with the flames of the Roman army.' (Cass. de B.G. i. 11.) Their request was complied with; Caesar marched against the Helvetii, cut off their rear guard while on the point of crossing the Arar, and in a second engagement entirely defeated them with great slaughter, and compelled them to return home. He then, by the desire of the Ædui and other Celtic people, led his victorious army against the Germans and defeated them, their king Arriovistus escaping across the Rhine, with a very few survivors of his numerous army.

During the greater part of Caesar's command in Gaul, the Ædui appear to have adhered steadily to the interests of the Romans; but in the general revolt which took place in the seventh year of his government, they were induced to join their countrymen in the struggle for national independence. A body of their troops under Epoporix and Verduumarus (who had been sent by Caesar when he
knew of the revolt of their countrymen), took possession of Nociudunum (Nevers), where Cæsar had deposited the hostages of the Galli, as well as the corn, money, and baggage for his army; and having carried away the hostages, divided the spoil and burnt the town. Cæsar therefore crossed the Liger (Loire) by a ford and marched R. towards the country of the Sequani, while the Galli held a general council at Bibrice (Autun) to determine to whom the chief command should be intrusted. The Āduli had required that they should ask them, but the confederates preferred the tried courage and skill of Verecingetorix, the Arvernian; and the Āduli, though mortified, were obliged to submit. The war now assumed a very serious character, and the affairs of the Romans were in a most critical situation; for the Gallic confederates had defeated an engagement of the cavalry, with the loss of Eperoedoix, and some other men of note who were taken prisoners: and the main body of the confederates retired, closely pursued by the Romans, to Alesia (Alise, or rather a mountain near Alise, a little town of the Aucois in Bourgogne), under the walls of which, in a very strong position, the Galli encamped. Verecingetorix, dismissing his cavalry to their respective states, with directions to gather all their forces and come to his relief, remained with eighty thousand chosen men to sustain the siege which the Gauls had already begun. Great economy and wise management, to make his scanty store of provisions last till the return of his countrymen.

Cæsar, aware of the inadequate number of his forces to guard lines of circumanvallation of the extent required to hem in the enemy, resolved to effect a stratagem by which he might take upon himself the appearance of being stronger than he was. The besieged were reduced to great distress for want of provisions; but their spirit was unbroken, and they determined in a general council, if no relief came, to kill those whom age rendered unable to bear the fatigues of war, and to render their part to their neighbours. At last the unexpected succours came, to the number of two hundred and forty thousand infantry, and eight thousand horse. Repeated attacks were made upon the Roman entrenchments both from within and without. The！engagement of Augustus, included in Gallic Belgia, though the inhabitants of it were of Celtic race.

First Kingdom of Bourgogne.—Early in the fifth century the Burgundians, a branch of the Vandals, one of the people occupying the ancient Germany (under which name was comprehended the country from the Rhine to the Borysthenes), who had gradually approached the Roman frontier, crossed the Rhine into Gallia, and established themselves there. This was probably about A.D. 407; and in a few years they so far spread their conquests that they gave name to it the Kingdom of Burgundy, comprehending the whole S.E. of France, and extending beyond the Rhone, and even the Loire. This kingdom was conquered (A.D. 534) by the Frankish princes, descendants and successors of Clovis, viz., Childerich, king of Paris, and Childebert, king of Soissons, and perhaps Theodebert, king of Austrasia. [BURGUNDIANS.]

Second Kingdom of Bourgogne.—In 555 Cloïaire, the sole successor of the race of Clovis, reunited under his own sway the portions of the kingdom of the Burgundians which at the conquest had been allotted to the victorious princes; and in 561 Goutran, his son, who succeeded to the kingdom in the person of his mother Gudrun, married to Gunther, king of the Burgundians (but much of what these people had subdued was attached to the kingdom of Austrasia), took the title of king of Bourgogne, and fixed his usual residence at Clithuns sur Sone. It is needless to trace the history of this kingdom which followed; sometimes it was divided with its sister kingdoms, Neustria, Austrasia, and Soissons, or with one or two of them; at others it was separate and single. It followed the fortune of war or of inheritance, and its boundaries varied also according to circumstance, but it never extended to the lands which are now united with one or more of the other kingdoms of the Franks.

To the weakness and incapacity of the Merovingian princes succeeded in 745 the more vigorous government of Pepin le Bref (the Short). Upon the division of the territories of丕针 his son Carloman and Charles or Carma- magne, the kingdom of Bourgogne fell to the former, but upon his death became part of the widely-extended empire of Charlemagne. In the partition of this empire, after a bloody war, among the children of Louis le Debonnaire, A.D. 843, the kingdom of Bourgogne was divided between the W. of the Saône to the lot of Charles le Chauve (the Bald), the part E. of the Saône to the Emperor Lothaire.

Supposed Third Kingdom of Bourgogne.—In the division of the territories of the Emperor Lothaire between his three sons the Burgundians were allowed a portion which resulted from the division was called the kingdom of Bourgogne. This kingdom comprehended what has since been known as the governments of Dauphiné and Provence, which had been included in the kingdom established by the Burgundians in this part of France, and had been also partially included in the second kingdom of Bourgogne under the Merovingian Guертan. But Plancher in his Histoire de Bourgogne asserts that this kingdom bore the name, not of Bourgogne, but of Provence; and although it was within the lines of the Burgundian empire, it does not appear to have included more than a very small part, if any, of either the province of Bourgogne as described at the beginning of this article, or of the county of Bourgogne or Franche Comté. Those portions of the province of Bourgogne which were in the time of Emperor Lothaire (Bresse, Bugey, &c.), were included in the kingdom of Austrasia, which came to Lothaire, second son of the emperor, and which took from him the name of Lotharingia, whence the more modern name of Lorraine. This portion of the Burgundian empire was affected by the various changes in following years. That part of Bourgogne which was comprehended in the dominions of Charles le Chauve passed by succession to his son Louis le Bave (the Stammerer), and in the partition of the states of this prince it fell to the lot of a domain of Provence, under the name of Dauphiné. The possessions of Carloman and his brother Louis II. were united into the kingdom of France, to be a portion of that kingdom.

Supposed later Kingdoms of Bourgogne.—Bourgogne Cisjurane, Bourgogne Transjurane, Arles. It has been already noticed that in the partition of the states of the Emperor Lothaire, A.D. 855, one of the kingdoms, that of Provence, formed by the partition and allotted to Charles, the youngest son of Lothaire, has been incorrectly styled by some the kingdom of Bourgogne. This kingdom was of short duration, and the title of king was assumed only by A.D. 863. In 879 another kingdom of Provençal origin, in which some authors give the title of Bourgogne Cisjurane, was formed by Boson, a powerful French noble. It comprehended Provence, Dauphiné, and afterwards part of the Aquitain and Viennoise.

During the troubles that succeeded the death of Charles le Gros (the Fat), king of France and emperor of Germany, under whom the empire of Charlemagne had been reunited, a kingdom was formed by the successful ambition of Duke of Burgundy, one of the nobles of that country (comprehending the various parts of the countries of the east and west of the former kingdom of the Burgundians), to which the vague and extensively applied name of Bourgogne Superieure, or Upper Burgundy, was given. This kingdom was called Bourgogne Transjurane, and comprehended Switzerland and some smaller districts. Rudolph, its first king, was elected in 888.
About A.D. 930 these kingdoms were united in the person of Rodolph II, king of Bourgogne Transjurane. He was consequently lord of all those extensive territories of northern Italy; and Hugues, to secure the peaceable possession of this, ceded to Rodolph, with certain reservations, his own original kingdom of Provence. The two kingdoms thus united were called the kingdom of Gaul or Franche Comté. It was a pilgrimage, the Holy Land, to which the Crusaders went at the time of the first crusade. Another of his descendants, Hugues III, visited the Holy Land as a crusader in 1171, and again he accompanied Philippe Auguste, king of France, in the crusade which he undertook in 1190-91, in conjunction with Richard L., king of England. Upon the return of Philippe to France, after the capture of Acre, the duke of Bourgogne was placed at the head of the French crusaders who remained in the Holy Land, and by his fear or jealousy prevented the advance of the Christian army when at the point of victory.

First race of Dukes of Bourgogne of the blood royal of France.—Robert, the son of Hugues Capet, is said to have bequeathed the Duchy of Bourgogne to his younger son Robert. Henri the elder son became feudal lord of the kingdom of Provence. In the war between the brothers, the testamentary disposition of the late king was confirmed, and Robert became Duke of Bourgogne and founder of the first royal race by which that dignity was held. Eudes, one of his descendants, died a pilgrim in the Holy Land during one of the crusades at the time of the first crusade.

Duchy of Bourgogne—Earliest Dukes.—The Duchy of Bourgogne consisted of a considerable part of the territory which now forms the department of Jura, and included several small districts, one of which was the Forest Comice, with some adjacent territores which were long ago disjoined from it, as the city of Langres in Champagne, and the city of Nevers, with its surrounding district of the Nivernois. Some also add the city of Lyon; but the dukes of Bourgogne have never acknowledged any authority in virtue of their title over that city, which therefore cannot be regarded as part of their domain. It appears that the name Bourgogne as given to a country has had very different applications. We have 1. The original domaine of a preceding not only the district which is the particular subject of this article, but also the whole S. E. of France and Savoy. 2. After the extinction of this kingdom, the name of Bourgogne appears to have been given to the districts composing it, though there was no jurisdiction exercised over it under that title except in the case of the second and later kingdoms, to which, whether correctly or not, its name is given. Of these later kingdoms, that formed by Goutran in the 6th century appears to have been the only one which was nearly coextensive with what is now the department of Jura, and the other date comparatively late and confined to certain portions of that kingdom to the E. and S. of the Rhône and Saône. 3. The county or the Franche Comté. 4. The Duchy, nearly coincident with that part of the province or military government of later times which lies N.W. of the Saône, and which, being a possession of the Duchy of Bourgogne under the Duchy of Burgundy, the districts of Bresse, Bugey, &c.

The earliest dukes or governors of Bourgogne under the Frankish kings were those at the head of the province, and in process of time their dignity and authority became hereditary, and from Richard le Justicier (brother of Bonson king of Provence, already mentioned), who held the title of duke in the latter part of the 9th century, the dignity descended by hereditary right to Hugues Capet king of France, in the middle and latter part of the 10th century. But although the practice of inheritance thus grew up, it was not yet recognised as legal; it was rather a concession made by the weakness of the kings to the fast-increasing power of the great feudal families. It was not until the 12th century, when the French were compelled to assume, probably by the influence of Hugues Capet, Robert the younger, the title of Hugues Capet, Robert granted the Duchy to his son Henri, who succeeded him on the throne of France as Henry I, and thus reunited the ducal crown with the crown.

First race of Dukes of the blood royal of France.—Robert, the fourth son of Jean II, king of France, received from his father (Sept. 1363) the Duchy of Bourgogne, to be held by him and his lawful heirs; and the government was continued by the house of Bourbon until 1364 by Charles V., son and successor of Jean II, and brother of Philippe. The duchy was distinguished by courage; he was present when only fifteen at the battle of Poitiers, where he was taken prisoner, and he held command in the armies of his brother in the wars which he carried on against the English. He married Marguerite, daughter and heiress of the count of Flanders, and upon the death of his father-in-law came into possession of the Comté de Flanders, Artois, Bourgogne (Franche Comté), Rethel, and Nevers; by prudence and mildness he ruled with great ability, and the kingdom was confirmed to him by the death of Charles V. He was one of the guardians of the new king, Charles VI., who came to the throne a minor, and afterwards had the government of the kingdom when that prince became a loutic.

In the year 1396 he sustained a severe blow in the captivity of his son, Jean, count of Nevers, who conducted a troop of the choicest of the young nobility of France to the succour of Sigismund king of Hungary against Bajazet or Bayazid, sultan of the Turks. In this troop, more eminent in high birth than in number, were the three eldest sons of the count of Nevers, who had been almost entirely the stable of France, Jean de Vienne, admiral of France (who had formerly defended Calais against Edward III. of England), Le Maréchal de Boucicaut. Confident in their courage, they rashly engaged near Nicopolis on the S. bank of the Danube with the vastly superior forces of the Sultan, and were either killed or taken prisoners. The defeat of this presumptuous band involved that of the whole Christian army, of which they formed the advanced guard. The aged and heroic De Vienne perished in the field; the duke of Nevers, the son of the Duke of Bourbon, was taken prisoner, and the highest rank were ransomed; the greater part of the prisoners were massacred in cold blood by Bajazet's order. Philippe le hardi died in 1404, aged sixty-three.

Jean, duke of Nevers, who had obtained the name of Bajazet from his father, and had been chosen to succeed the duched of Bourbon on the death of his father, being then thirty-three years of age. He succeeded also to the rivalry which had existed between his father and Louis, duke of Orleans, brother of the imbecile Charles VI. These princes had disputed the government,
with the dauphin, in an interview with whom, at the bridge of Montereau-sur-Seine, he was assassinated 10th Sept. 1419. His body, after remaining all night naked on the ground, was carried in a pauper's bier to the church of Notre Dame, in Montereau, from whence it was removed, in the course of the following year, on the capture of Montereau by the Bourguignons and the English, to Dijon, and buried in the church of the Carthusians there.

Philippe, surnamed le Bon, the son of Jean Sans-peur, succeeded to the duchy, being then twenty-three years of age. The general cry for vengeance against the assassins of the late duke, co-operating with the solicitations of Isabelle de Bavière, the deceased lady's sister, and the feelings, prompted Philippe to offer his alliance to Henry V. of England. Henry was too skilful a politician to refuse the offer, and a treaty was concluded between the two princes, the object of which was the ruin of the dauphin. The duke had in consequence assembled troops, reduced the towns that lay in his way, joined the English forces, reduced Montereau, and entered Paris by the side of Henry V. Some time afterwards Philippe attacked St. Riquier on the Somme, then one of the strongest places in Picardy, and took prisoners with his own hand Xaintrailes, or Saintrailes, a celebrated French captain, who attempted to relieve it.

On the deaths of Henry V. of England and Charles VI. of France in 1422, the regency of France during the minority of Henry VI., son of Henry V. (to whom, by virtue of marriage with the daughter of Edward III., a dukedom was also offered), was offered to the duke of Bourgogne; but he declined it in favour of John duke of Bedford, uncle of the young king. The marriage of Bedford with the sister of Philippe rendered their union closer; but that union had nearly been broken between him and his opposite. Margaret de Brabant, cousin to Philippe, and Humphrey duke of Gloucester, a younger brother of Bedford. Jacqueline, heires of Brabant, Holland, Zeeland, and Friesland, had married Jean, and brought to him the rich inheritance just mentioned; but mutual wrongs produced a separation, and a divorce had been obtained on the plea of consanguinity. The duke of Gloucester married the divorced Jacqueline, and by virtue of this marriage claimed her inheritance, and embarked a considerable force to take possession of it. The duke of Bourgogne took up the cause of the Duke Jean of Brabant, gained several advantages over the English, and took Jacqueline (who had been abandoned by Humphrey) prisoner. She escaped; but afterwards, Duke Jean being dead, and Duke Humphrey having divorced her, she put herself forward by her own request, and went over to that of the princes. Another accommodation, negotiated at Bourges (A.D. 1412), restored some appearance of tranquillity to France. Jean still seems to have retained predominance, at least in the capital, which was the residence of his brother-in-law, and composed of the vilesst of the rabble, committed great disorders. Hostilities breaking out again, he was afterwards compelled to leave Paris, where his opponents established themselves. Not content with this, they pursued the duke, who had assembled his troops and retired to the neighbourhood of Paris, but had retired on finding it was defended. Another peace, that of Arras, put an end to these disturbances for a time (A.D. 1414): Jean was excluded from the capital, and though still powerful, was no longer predominant.

In England Edward IV. invaded the north of England in the great battle of Agincourt, the flower of the Armaignac party fell. Jean upon this marched toward Paris, but with strange irresolution stopped short at Lagny, and being ordered by the Constable, the Count d'Armaignac, to retire, did so. The tyranny of the constable however soon caused the Parisians to embrace again the Bourguignon interest; they opened the gates in the night to the captains of that party, upon whose entry the rabble again signalized their ferocity by the massacre of the Constable d'Armaignac and others. Jean at this time arrived at Orleans, and was compelled to witness further massacres by the populace; on the first of his brothers whom he could not restrain. His life and power were however approaching their close. Jean, with all his queen, having the king in his power, was at enmity with the dauphin chief of the Armaignacs. He tried to negotiate with the king of England for a division of the disputes of faction, was extending his conquests in France, and had just taken Rouen (A.D. 1419). Failing however in this negotiation, he attempted a reconciliation

The opposite party however gathered strength; and though hostilities were not absolutely declared, armed bands, gathered by each faction, used great license in the country. A commission of inquiry, empanelled in London, (A.D. 1411), was only a prelude to more serious disturbances. Open hostilities took place, and the duke of Bourgogne allied himself with the king of England, Henry IV., who was then at London, and went over to that of the princes. Another accommodation, negotiated at Bourges (A.D. 1412), restored some appearance of tranquillity to France. Jean still seems to have retained predominance, at least in the capital, which was the residence of his brother-in-law, and composed of the vilest of the rabble, committed great disorders. Hostilities breaking out again, he was afterwards compelled to leave Paris, where his opponents established themselves. Not content with this, they pursued the duke, who had assembled his troops and returned to the neighbourhood of Paris, but had retired on finding it was defended. Another peace, that of Arras, put an end to these disturbances for a time (A.D. 1414): Jean was excluded from the capital, and though still powerful, was no longer predominant.
this treaty, but that it was occasioned by grief at the hearing or

Upon the peace of Arras the duke of Bourgogne assisted by his troops in the recovery of Paris from the English; and in 1436 or 1437 he attacked Calais, which he attempted unsuccessfully to wrest from his late allies. Following years were occupied by troubles in the Netherlands, where the commercial interests and the possession of the rich cities of Bruges and Ypres were in constant danger; and, in 1441, the English kindled a war of destruction and aggression among the Burgundian nobles, but the latter were not intimidated by their example. In 1443, Charles, the second son of the duke of Burgundy, was slain by accident; otherwise he would have been one of the leading men of his time. Philippe d'Orléans, who succeeded him, was only a child. The duchy of Burgundy was, therefore, in a state of despondency when the death of Charles V. occurred. The Burgundian lords, therefore, took advantage of the situation, and, by a treaty with the English, made a division of the kingdom of France. The treaty was in favor of the English, and was ratified by the Estates-General of France. The English, however, were not satisfied, and, in 1445, a new treaty was made with the Burgundian lords, which was ratified by the Estates-General of France.

The year 1446 was distinguished by the decline of the power of the duchy of Burgundy. The Burgundian lords, who had been the chief supporters of the French king, were now weakened by the weakness of the duchy of Burgundy. The Burgundian lords, therefore, took advantage of the situation, and, by a treaty with the English, made a division of the kingdom of France. The treaty was in favor of the English, and was ratified by the Estates-General of France. The English, however, were not satisfied, and, in 1445, a new treaty was made with the Burgundian lords, which was ratified by the Estates-General of France.

[THE PENNY CYCLOPÆDIA.]
sought to trim the balance between Bourgogne and France, by intriguing with both the princes, was detected in his double treachery, and by a compact between the duke and the king, was delivered up to the latter, who had him tried and decapitated without delay. During this interval, Charles managed to acquire the landsgraviate of Alsace, a possession of the Holy Roman Empire, to put an end to a constant rivalry in sessions; and encouraged by the extent of his territories and his power, he sought to obtain of the Emperor Frederick III. the title of King. The emperor was once on his way to confer this dignity, when some suspicion caused him to retire; so nearly had this ambitious noble obtained the regal dignity.

But the close of Charles's career was beset with misfortunes. In the year 1474 he was involved in hostilities with the emperor of Germany, the Swiss, and his old inveterate enemies, the English. The French not only raised a formidable force of English and Italian adventurers, and the success that had attended his enterprises for some time had increased his natural arrogance of temper. He was however compelled to yield to the pressure of his enemies; and was glad to purchase a reconciliation with the emperor. In 1475 he possessed himself of the duchy of Lorraine; and in 1476 he attacked the Swiss, who, though far inferior in numerical force, defeated him in a battle at Granson, in the Pays de Vaud, near the S.W. extremity of the L. of Neuchâtel. Emperor Frederick, however, arrived in the nick of time, and the Emperor of Germany, the Swiss, and his old inveterate enemies, the English. The French not only raised a formidable force of English and Italian adventurers, and the success that had attended his enterprises for some time had increased his natural arrogance of temper. He was however compelled to yield to the pressure of his enemies; and was glad to purchase a reconciliation with the emperor. In 1475 he possessed himself of the duchy of Lorraine; and in 1476 he attacked the Swiss, who, though far inferior in numerical force, defeated him in a battle at Granson, in the Pays de Vaud, near the S.W. extremity of the L. of Neuchâtel. Emperor Frederick, however, arrived in the nick of time, and the

Bourgoign, Canal de, one of the most important of the canals of France, and a portion of that system of inland navigation by which it is proposed to connect the Seine with the Rhine. This can (which is either yet uncompleted, or not yet open to navigation) connects the basin of the Seine near Montbard, by a circuit it returns again to the Seine, and runs side by side with that riv, to its source. It is carried by a tunnel nearly 8 m. long, under the chain of hills which separates the basins of the Seine and Sabine; and following nearly the course of the Ouche, below the plantation of Neuvy, the basin of the Sabine is 190 to 190 m. By thus uniting the Seine and Sabine it opens the navigation from the Channel to the Mediterranean; and by means of the Canal deJonquisier, which communicates from the Sabine to the Rhine, it opens the navigation from the Channel and the Seine to the Rhine. It is comprehended in the departments of the Seine and Côte d'Or.

Bourgoign, Jean François, Baron de, was descended from a noble house, not unknown in the history of France. One of his predecessors, Edmond de Bourgoin, prior of a monastery of Jacobins at the time of the Ligue, eulogised the regicide Jacobin Jacques Clement, declassified and fought against Henri IV.; and was sentenced, by the parliament of Toulouse, to be torn to pieces by the windmills of that city. The Duc de Bourgoin, having since successively published books, now forgotten, upon history, finance, jurisprudence, philology, and divinity. Jean Francois, the subject of this present article, was born at Noyers, a.d. 1743. At the age of twenty-three he quit the duties of his diplomatic employment as Secretary of Legation. In that capacity, in the year 1777, he accompanied M. de Montmorin, the French ambassador to the court of Spain, to Madrid, where he resided nine years, for the last two as Chargé d'Affaires. His resignment to Caffarey, to be in charge of the French intercourse with the Spanish court, the condition of Spain, political, statistical and social, which, upon his return to France, he embodied in his Voyage en Espagne, or Tableau de l'Etat actuel de cette Monarchie, published in 1783, and then esteemed the best work extant upon Spain. In 1791 Bourgoignie's return to Spain as minister plenipotentiary, remained there until 1793, when he collected additional materials for his book, of which a second edition, thus enlarged, appeared in 1797. Third and fourth editions, with successive additions and corrections, in several other countries. A new edition, published in 1805, appeared in 1803 and 1807, under the title of Tableau de l'Espagne Moderne. It is upon this work, which has been translated into the English, German, and Spanish languages at least, that the Baron de Bourgoignie's claims to fame are based. He left France in 1796 quitting Spain until Bonaparte assumed the government of France, when he was again employed in several diplomatic missions, and died, a.d. 1811, as French envoy to Saxony. His recent work, Les Memoires Historiques et Philosophiques sur le Royaume de Pologne, is a posthumous work, and is an important addition to the historical literature of the country. There are also some Memoires de la maison de Bourgoin, in the Encyclopedie, and a Biographie Universelle, which are valuable contributions to the literature of the country. Bourgoignie's work, Tableau de l'Espagne Moderne, is a complete and accurate history of Spain, and is a valuable addition to the literature of the country.

Bourignon, Antoine, was a celebrated religious enthusiast, and founder of a sect which acquired so much importance that, under the name of the Bourgignons, the designation was applied to those who cultivated the art of divination. He was denounced by candidates for holy orders in the Church of Scotland. She was the daughter of a little merchant, and was born in the year 1610, so singularly ugly that a family consultation was held upon the propriety of destroying the infant as a monster. This fate she escaped, but remained an object of derision to her mother, in consequence of which her education was neglected, and the first books she got hold of being to be 'Lives of the early Christians,' and mystical tracts, her ardent inclination acquired the title of fanatical. After his death, it has been asserted that her religious zeal displayed itself so early, that at four years of age she outran to be removed to a more Chris-
tian country than Lille, where the unevangelical lives of the townpeople shocked her.

As Antoinette was a considerable heiress her deformity did not deter her from being brought in marriage; and when she reached her twentieth year one of her suitors was accepted by her parents. But the enthusiasm had made a vow of virginity, and on the very day appointed for celebrating her nuptials she fled in man's clothes. She now obtained admission amongst the sects, and supporting herself by the labour of her hands until the year 1648, when she inherited her father's property. She was then appointed governess of an hospital at Lille, but soon afterwards was expelled the town by the city police, on account of the disorders that her doctrines provoked. She then resumed her wanderings. About this time she was again persecuted with suitors, two of whom were so violent, each severally threatening to kill her if she would not marry him, that she was obliged to apply to the police for protection, and two men were sent to guard her house. She died in 1649, and left her property to the Lille hospital of which she had been governess.

She taught that the true church was extinct, and God had sent her to restore it. She allowed no liturgy, worship being performed during the service of her doctrine mystical, and she required an impossible degree of perfection from her disciples. She is said to have been extraordinarily eloquent, and was at least equally dignified, for she wrote twenty-two bulky volumes, most of which were printed at a press she established, and devoted itself to their promulgation. After her death Poiret, a mystical Dominican, and a disciple of the Cartesian philosophy, wrote her life, and reduced her doctrines into a regular system. (Algers. Deutscher Rechel Encyclopaedie; Bieg, Univ.; Chalmers, Theological Dictionary.)

BOURN, or BURNN. [Keswick, Lincashire.]

BOUSSAC, a town in France, in the dep. of Creuse, and capital of one of the arrond. into which that dep. is divided. It is upon the river Creuse, about 174 m. nearly S. of Paris, 40° 32' N. lat. 1° 19' E. long. 'Boussa,' says M. Maite Brun, 'the least populous of all the chief towns (whether of arrond. or dep.) of France, stands on a rock almost inaccessible to carriages; surrounded by walls flanked with towers, commanded by an ancient castle of the Counts of Poitiers, from whose eyes the eye looks down upon a pass formed by mountains of acid and wild aspect; this place is the most desolate abode that can be imagined.' The pop. of the town is omitted in the returns of 1811. In the general list of the late dynasty, by a previous census (we believe that of 1836) it was 757.

The arrond. of Boussac contained, in 1826, 86,783 inh.

BOUSSU. [Hainault.]

BOUSTROPHEDON. [Alphabet, p. 892.]

Boutros, or Boutrosse (Greek word for the metaphysician, professor of moral philosophy at the University of Gottingen, is chiefly esteemed for his 'History of Modern Literature.' He was born in the year 1756, at an iron foundery near Goslar, and completed his studies at Gottingen. He was educated for the law, but was diverted from his legal pursuits by the charms of lighter literature. At an early age he published several poems and a novel, 'Graf Donamar,' which is said to give a good picture of German life; but at the age of 25, being struck with a sense of the insufficiency of such occupation as the business of life, he devoted himself to metaphysics as a disciple of the then reigning masters, Kant and Jacobi. He was in consequence appointed to the chair of moral philosophy at Gottingen in 1779. Both in his lectures and in his metaphysical writings, he has ably expounded the principles of the metaphysicians of the 18th century, and produced nothing brilliantly new or original. His literary reputation rests upon his 'Geschichte der Neueren Poetische und Beredsamkeit,' in 12 volumes 8vo., published in 1801. This work contains separate critical histories of the Belles Lettres of Italy, Spain, Portugal, France, England and Germany, from the revival of letters to the close of the 18th century, and is still reckoned one of the best books that Germany has produced in this kind. It is not however to be quite implicitly relied upon, especially in the earlier volumes; the author either improved as he proceeded, or laboured with heartier good will upon English and German literature. Portions of Bouterow's work have been translated into French and English. Professor Bouterow died on the 5th of January, 1839, at Gottingen, in the 76th year of his age. Sir J. T. Smith, of the Mission to the Mohawks, states that he laboured the 19th of June, 1838, at the age of 56, in the Indian village of the Oneidas, on Lake Ontario, N.W., from which Bovignes is a kind of suburb, in 54° 17' N. lat. and 4° 53' E. long.

Bouignes, which was formerly a well-peopled place, carrying on a considerable trade, is now a very inconsiderable place, having rather the appearance of a village, and contains only 161 houses and 779 inhabitants. The town has a church, two chapels, a town-hall, an hospital, a prison, and a commercial school, in which 68 children are instructed. The commune contains two iron founderies, a pottery, two refiners of salt, and three saw-mills.

The castle of Bouignes was in existence in the seventh century. In the ninth century it was sacked and burnt by the Normans. In 1110 a fort was built by Godfrey, Count of Namur, on the side of the hill by which the town is commanded. In 1175 the town was surrounded by walls, and twelve years afterwards was besieged and taken by the Count of Hainault. At the beginning of the 14th century the inhabitants of Bouignes and Dinant were stimulated by commercial jealousy to make war upon each other, and it was only by the intervention of Lyon, that the fortress of Creve-coeur was built by the inhabitants of Bouignes. Only the ruins of a part of this fort now remain: they are rendered memorable by the heroic death, in 1545, of three females when the town was taken by the French. These three valiant women, having taken refuge in a church, threw themselves from the rocks rather than fall into the hands of the enemy. On this occasion the bravery of the defenders of the town was ill required by the conquerors; the inhabitants, who were not killed during the siege or in the assault, were allowed to retire freely.

Bouignes was ravaged by the plague in 1262, in 1306, in 1478, and in 1579. It was exposed to a very disastrous inundation of the River Maas in 1800. (Dict. Geol. de la Prov. de Namur, par Vandermaelen; Recueil, &c., par Y. der M. Gautier's Voyages.)

BOUVINES, a vil. of France, in the neighbourhood of Lille, dep. of Nord, remarkable only for a great battle fought here in the year 1214, between the emperor Otto IV and his allies, the Counts of Flanders, Boulogne and others, under the one hand, and Philip Augustus king of France, on the other. The forces were about equal, and by no means so numerous as the estimates of some historians would make them. The rival monarchs distinguished themselves by their valor; the latter also showed that the army remained with Philip. Otto fled, and the counts of Boulogne, Flanders, and others, were taken prisoners.

BOW. [ARCHERY.]

Bow, in music, a machine used for drawing out the sounds from the strings of stringed instruments, by moving the violin kind. The bow consists of—1. the stick, which should be of hard elastic wood, Brazil wood being generally used for the purpose; 2. of from eighty to a hundred horse-hairs; and 3. of a nut regulated by a screw, by which more or less tension is given to the hairs. The violin bow is very short in Corelli's time, but gradually increased in length, till Viotti, whose dictum in whatever concerned his instrument was received as law, fixed it at twenty-eight inches. The violincello bow is larger and stronger. That of the double-bass is almost two feet long, and the stick is bent, forming something like the segment of a circle, of which the hairs when stretched are the chord.

BOW ISLAND (HE-OW), the largest of the coral islands in the Dangerous Archipelago, was discovered by M. J. J. Arago, in July, 1827. It is 50 miles in length, and at its narrowest point is about 20 miles wide. In the middle of the island, and about 4 miles from the beach, is a vast lake, in the middle of which is a coral island, about 2 miles in circumference, which is covered with a flat forest. The water of the lake is tranquil, and is of a deep dark green; the bottom appears to be covered with a deposit of sand and mud. In the interior of the island is a large lagoon, which is 10 miles in length, and 3 miles in width. The shore is of coral reef, and the whole island is covered with a forest of coconut, coco-de-mer, and other species of palm, with many kinds of flowering shrubs. The interior of the island is divided into two large basins, which are connected by a narrow neck of land. The climate of the island is very healthy, and the air is very pure. The soil is of a light loamy character, and the vegetation is luxuriant. The inhabitants of the island are a mixed race of Chinese, Malays, and natives of the island. The produce of the island consists chiefly of coconuts, sugar-cane, and breadfruit. The population of the island is about 5,000, and the annual produce of coconuts is about 300,000. The island is governed by a Resident, who is appointed by the British government. The island is said to be rich in copper and gold.
of trees and heaps of sand, is little more than a reef, over which the sea washes into the lake; but there is no passage even for a boat, except in one spot which may be entered by a large ship. This opening leads to the north end of the island, and is only 115 feet broad from reef to reef, with a coral knoll in the centre. When, owing to the heavy surf breaking over the reef into the lake, the latter has attained a higher level than the ocean, the water rushes through the opening; and during the rainy season it sometimes causes overfalls which would be very dangerous to boats.

Within the lagoon the anchorage is perfectly secure; the bottom is generally of a fine white sand. Water may be procured by digging through the sand into the coral rock, and drawing up the water with sieves. Some fish, and to flow into the wells as fast as casks could be filled. In this manner the Blossom obtained ten tuns a day, which proved tolerably good, though it does not keep so well as spring water; it was found to be impregnated with marl of a dark colour, and the bottom of the wells contained a dark red colour, and very hard; there are also cocoa-nut palms, and pandanus trees. The lagoon abounds in shell-fish, particularly of the pearl oyster kind. A brig belonging to the Australian Pearl Company, which had been out there, after the purpose, procured sometimes 1700 a day, but they did not yield well, being mostly of the seed kind.

The island is inhabited by about a hundred persons, living in miserable huts; they are an indolent ill-looking race, with black skin, and their eyes turned down at the corners, wrinkled countenances, and long bushy hair matted with dirt and vermin. Their stature is above the middle size, but they are generally crooked; their limbs are long, muscles flaccid, and the only covering is the grass growing on the backs of their heads. Hitherto, however, there were, the women presented a still more revolting appearance; they are obliged to labour hard for the men in collecting shell-fish on the reefs, and the pandanus nuts, which, with other fish caught by hook and line, and the cocoa-nuts, is their only diet. They have a few rude-made canoes. The number of house-flies is quite incredible; the young children lying naked on mats become so covered with them that it is difficult to discover any part of their skin. Their language is a peculiar one, who is believed to be their native, and whose body is the only covering to his superior bodily powers. They appear to have been cannibals; but the bodies of enemies, of those who die violent deaths, and of murderers who have suffered, were the only subjects selected for these feasts; and when the partiality for them in such state they devour fish, or turtle which are sometimes found on the shore.

Every man has his own deity, of which the most common is a piece of wood with a tuft of hair attached to it; or the head of a monkey, which is considered as more efficacious than the wood. This is suspended to a tree, and to it they address their prayers. Polygamy is usual; and they appear to believe in the transmigration of souls. The bodies of the dead are wrapped in mats and buried, with a wooden image of the deceased, which is believed that the soul for a time frequents the spot. The manufactures are mats, maros, baskets, fishing-hooks of the mother-of-pearl, lines, &c. The entrance to the lake lies in 18° 45' S. lat., 140° 57' W. long. (Beechey's Voyages to the Pacific and Behring's Straits, BOWDICH, THOMAS EDWARD, was the son of a merchant of Bristol, where he was born in 1799. His father at first intended to educate him for the bar, but, much against his wishes, it was eventually arranged that he should engage in trade. On being admitted, while still young, a junior partner in his father's house, he married; but, after a struggle of some years, both with his own inclinations, and with want of success, he entered himself at Oxford, where he was for a very short time. By the interest of his uncle, Mr. J. Hope Smith, the governor-in-chief of the settlements belonging to the African Company, he obtained a writership in that service, and proceeded to Cape Coast Castle in 1814. About two years afterwards he returned for a short time to England, when he was appointed by the Company to conduct a mission to the King of Ashantees; but on his arrival at Cape Coast Castle it was thought by his uncle and the council there that he was too young to go to the head of the mission, and Mr. James, the governor of the fort of Accra, was put in his place.

[Ashantees.]
Merchant Taylors' School. Bowyer was entered, in June, 1716, a scholar of St. John's College, Cambridge; where he formed an intimate friendship with several eminent individuals, whose services at a later period contributed to his reputation and prosperity, more particularly with Jeremiah More, and the learned numismatist, the Rev. Wm. Clowes. His industry, heathen knowledge, and proficiency in the Greek and Latin classics, moreover, commenced at an early age, and illustrated works which he printed, the following, as specimens of typographical beauty, may be selected: — Matthew Parker Cant. Arch. de Antiq. Brit. Eccles., vol. 1729, Vertot's 'Knights of Malta,' 2 vols. fol. 1729; 'Maittaire's Marmorum Rerum, &c.' 2 vols. fol. 1731; 'Itineraries and Travels,' 6 vols. fol. 1732; Pococke's 'Description of the East,' 3 vols. fol. 1743; the 'Copitic Pentateuch,' by Dr. Wilkins, 1731; 'Lyseis Orations,' by Dr. Taylor, 4 to., 1739. B. published also Dr. Middleton's 'The Origin of Printing, corrected by the Author, 12mo. 1740.' Dr. Middleton's Dissertation in origin, Engl. 2d., 'Mearman's account of its invention at Haarlem, with numerous notes and corrections.' Although the result of more recent bibliographical researches has entirely discredited the legend about Laurens Coster at Haarlem, the learned illustrations which B. has given to his publication must always render it one of the most important on the subject. But the reputation of Bowyer has been most extended by his 'Critical Conjectures on the New Testament,' which were published in the first year of the 18th century, in Greek text, of which the title in full is 'Novum Testamentum Graecum, ad fidem Graecorum solum Codicium MSS., nume. primorum expressum, adstituente Joanne Jacobo Wetsteinio, juxta sectiones Jo. Alberti Bengelii divinae et nova inter. Emendationes Conjecturales viarum doctorum undecunque collecta. Curia, typis, et sumtibus Gulielmi Bowyer;' 2 vols. 12mo., 1763. This, says Dr. Harwood, in the appendix of his own edition, 'is a valuable Greek Testament; Mr. Bowyer is an excellent Greek scholar, and it is to be feared in the last learned printer in England.' In Le Long's Bibliotheca Sacra, ed. Masch, tom. i., p. 246, it is highly approved, and the author is said to be 'viri doctus, et Stephano- rum tum in arte sof, tum in Graecarum litterarum scientia praestantissimus.' This work was long printed in Massachusetts, in returning thanks in 1768, for a presentation copy, say, 'The very accurate editions of many erudite authors, published under your inspection, assure us of the greatness of your merit as a learned editor. Your very curious edition of the Greek Testament, your 'Critical Conjectures,' notes, and many happy conjectures, especially as to punctuation, an affair of the utmost importance in ascertaining the sense, we esteem as a rich treasure of learning, and of more intrinsic value than many large volumes of the commentators.' The alteration of the text of Bowyer in the 2nd vol. a catalogue is given of the readings of Wetstein which are at variance with the text of Mill, or, which is the same thing, that of the 3rd edition of R. Stephens; excepting the Apocalypses, in which the variations were too numerous to be included. The words proposed to be, without substitution of others, omitted, as Roman. iv. final., I John v. 7 and 8, are inclosed within parentheses. A critical account of this edition is given in the Bibliotheca Theologica, Ernestus, tom. vi. p. 551, et seq. (in the translation of Bishop Marsh, Introduction, vol. ii.) 'Many obscurities in the Greek text are owing,' says Michaelis, p. 516, 'to an improper position of points; in collecting the opinions of the learned on punctuation, very few have pointed their heads so high as to render his work indispensable to the commentator and the critic.' But after the assertion, p. 395, that 'a collection of critical conjectures may be of great use in establishing the text of the Greek Testament; and such is the work published by Bowyer, a learned London printer; a work classical in its kind, to which the remarks of future critics will be annexed; it is stated, with apparent inconsistency, in the following page, that 'of the several hundreds of critical conjectures which Bowyer has produced there is hardly one which, after impartial examination, should be maintained; yet so much enlarged and improved edition of the 'Conjectures' was published in 1772. It was translated into German by the professor of Theology and Oriental Literature at Leipzig, Dr. Schultze. A 3rd edition appeared in 1782; and the 4th and best in 1815, in 4to. As it furnishes the greatest evidence of Bowyer's erudition and critical sagacity, we subjoin at length its title:— Critical Conjectures and Ob-
BOY or BOYARD, the general name for a Russian
monarch. The original nobility of Russia were composed of
persons descended from the leading warriors of the first
Russian monarch, Rurik and his successors, who, like the
Norman warriors under our own William I., received large
feves in the country which their valor had enabled their chief
to win. The feves seem to have been held by the sole tenures
of military service; they paid no imposition to the prince, but
were pledged in default of service to do him personal and
right of customs and tribute which himself had on Aix
domains. The fierce struggles between kings and nobles
which we read of in other countries were not known in
Russia. Various causes have been assigned for this; the
ordinary levies were subject to the direct supervision of the
commandant, who, however, was only a mere
doublet one; to which we may add the circumstances
which combined to prevent any great power from being
concentrated in the hands of individual nobles. In the first
place, the scarcity of cities and strong holds prevented any
large body of troops from being formed; the military
monarchy was subject to continual mutation in the
struggles which took place; the loss of the power of
the prince, which was always a matter of doubt to
result from the singular law of succession, by which the
brother of a deceased prince, and not his son, succeeded
to the vacant appanage. It was also an unfavourable
circumstance resulting from this law, that the prince of the
lateral branch was usually a stranger in the appanage to
which he succeeded, and that he generally came to it with a train
of nobles and followers who engrossed his favour and
preference. In fact, the princes themselves had more analogy
than the boyards to the turbulent nobles of France
under the French kings, who, in order to secure the
chivalry, which in those countries regarded the barons as their
immediate superiors.

The boyards of Russia then owed their final elevation
to the extinction of the petty principalities, and to the
establishment of the principalities of the grand dukes.
In 1340, a law was passed by Ivan the Terrible,
which vested the title of grand duke, and
contingent, until he arrived on the verge of 80, to correct
all the Greek works which he printed. His long career
of incessant application to study and business was terminated
by the publication, in 1777, of his edition of Bentley's
Dictionary of the Classical Languages of Greece and
Edition of Plutarch's Lives, which excited a great
veneration for 'the mighty scholar,' and augmented his
Dissertation with numerous remarks collected by
himself from the works of Markland, Upton, Lowth,
Owen, Clarke, Warburton, and Dr. Salmon, Master of the
Chair of the University of Oxford, who was in 1768
constituted a member of the Grand Collège for
the system of spelling, as saught, reit, diein, reperc, &c.
In the same year, on the 15th of November, at the age of
78, Bowyer died, and was interred at Low Leighton, in
Essex. In his will he left considerable sums to indigent
princes; the following is Cattarino's, who, as he
subscribes it thus: 'Typographerum post Stephanos et
Commelinos longo docetissimus; linguarum Latinae, Graecae,
et Hebraice perstitissimae.' There were indeed, at the time,
several celebrated printers, as Baskerville of Birmingham,
Foulis of Glasgow, and Crapeau of Paris; but Bowyer,
as to erudition and critical accuracy, was unrivalled by any of
his profession in England or on the Continent, during more
than half a century. Among the numerous
of literary erudition with whom he maintained a learned
correspondence, his most intimate correspondent was the
Archbishop Secker, Bishops Lowth, Hurd, Warburton,
Pears, Sherlock, Clayton, Pococke, Atterbury; Dr. Wotton,
Chandler, Whiston, Taylor, Pridmore, Jortin, Conyers
Middleton; Pops and Thompson; Garrick, Lord Lyttelton;
Dr. Mead, Gough, Chislett, Clarke, Ainsworth, De Masly,
Markland, Maitaile, and Palairet, who in his Latin letters
salutes him as 'vir doctissimo et carissimo.' Although a
true Jacobite son of the Church, he manifested a most
charitable disposition. In his remarks, for instance, on the
English translation of the Bible published in
1746, a translation, with learned notes by himself, he says,
'It is one of the hardest things in nature to give to
an enemy the praise he deserves—the idea of apostasy is sup-
pocused to be inconsistent with every virtue; and the
man who has rejected the Christian religion is thought to have
abandoned humanity.' He was greatly admired and re-
spected by the author of the noted Arian 'Essay on Spirit,'
Bishop Clayton, who gave him the copyright of the whole
of his works. Bowyer was estimable not only for his
literary labours, but for his benevolence. In general moral
rectitude and amiability simplelicity of manners, few have exceeded
'the last of learned printers.' His bust in marble, with a portrait of his father,
is in St. John's Hall.

BOYAR, or BOYARD, the general name for a Russian
monarch. The original nobility of Russia were composed of
persons descended from the leading warriors of the first
Russian monarch, Rurik and his successors, who, like the
Norman warriors under our own William I., received large
feves in the country which their valor had enabled their chief to
and Italian composers. In 1738 he succeeded Walden as one of the composers to the Chapels-Royal, and in performing services and many anthems which reflect so much honour on the English school of church music. Some years after he set Edward Moore's Solomon, a serenade, to music, in which are the duets ‘Together let us range the fields,’ ‘the air of the shepherd,’—and other highly esteemed compositions. In 1749 he was selected to set an ode for the installation of the Duke of Newcastle, as chancellor of the University of Cambridge, where the degree of doctor in music was, unsolicited, conferred on him. The same year he gave birth to The Chapel, a drama written by Moses Mendels, the music of which, composed by Boyce, immediately became popular, and so continued many years afterwards.

On the death of Dr. Greene, in 1753, Dr. Boyce was appointed to his place, and to the post of Organist to the Chapel Royal, and was called upon by the College of Musicians, then a lucrative and honourable office. In that year he also produced his finest work, the grand anthem, 'Lord, thou hast been our refuge,' which he wrote for The Feast of the Sons of the Clergy, and at the annual meeting of that corporation in St. Paul's cathedral, which office he held in conjunction with that of composer. In 1760 he published in twelve large folio volumes, the Cathedral Music of the English Church, a work which, with the splendid and useful work, in which the disinterestedness of the editor is not less remarkable than his deep research and acute discrimination; for not desiring any pecuniary remuneration for his labours, he fixed a price on the publications which were necessary to inform him, which only indemnified him for the expense he had incurred in preparing and bringing it out.

Dr. Boyce during many years suffered much from the gout, which attacked him in 1755, which became more frequent, and as he advanced in years, his health became worse. In 1758 he was in a state of great weakness, and was confined to his bed for some weeks. In 1759 he was converted to St. Paul's cathedral, and his obsequies were performed with every mark of affection and respect, many persons of distinction attending, together with almost every person of rank in London, as all known for talent, or connived for the great occasion. A second is the last recorded of him, the latter died many years ago, leaving no issue.

The published works of this excellent composer are, Fifteen Anthems, together with a Te Deum and Jubilate, in several parts; 1580, a grand anthem, Lord, thou hast been our refuge, for a full band. A second, Blessed is he that considereth the poor and needy, for the same, 1692; a Te Deum, Jubilate, and six anthems, printed in Dr. Arnold's Collection of Cathedral Music; the Serenata of Solomon; the Rosary Mass, which was performed at Westminster Abbey, which appeared in Lyra Britannica; The British Orpheus; The Vocal Musical Masque, &c.

BOYDELL, JOHN, was born, as asserted in the 'Gentleman's Magazine,' in Staffordshire; at Stanton in Shropshire in 1739, or 1740, it is no longer certain. According to Mr. Nichols in his 'Literary Anecdotes' (vol. iii. p. 411), an acknowledged authority for such particulars, in Derbyshire, in the year 1719. In his youth he was designed for the profession of his father, that of a land surveyor, to which he was for some time attended; but having, it is said, accidentally seen a volume of views of country seats by Baldy, his taste was developed, and he resolved to become an engraver. He accordingly proceeded to London, where, though, at the age of 21, he bound himself for seven years to a Mr. Diddams, but was discharged before the expiration of his apprenticeship he published by subscription, in 1746, a volume of his own engravings, consisting of 152 views in England and Wales; price 5 guineas. They are now interesting chiefly as an indication of the imperfect state of the Art in England, and are compared as compared with the improvement effected afterwards by his own exertions. Indeed he never himself excelled as an artist, a fact which his judgment and candour induced him often to acknowledge. These humble specimens served however to commence a very long and continuous course of prosperity; for with the profits of this publication he entered into business for himself as a print-seller; and by the adoption of a very liberal policy in employing and amply remunerating the best artists of the time, he gradually extended his speculations, and acquired a large income, and a great reputation as an enterprising and generous patron of genius. He engaged Woollett to engrave the celebrated pictures of Niobe and Phaeton; paying for the former 100 guineas, and for the latter 150; and both are sold at 20 guineas each; but have since, at auctions, produced 10 and 11 guineas: in short, he contrived to employ every aspirant to distinction whose energies wanted encouragement. When Boydell began business there were no very eminent English artists in London, and the foreign engravers, by the circumstances were reversed; for the importation of prints was almost entirely discontinued, and a large exportation ensued. Holland, Flanders, and Germany were the principal markets in which the engravings of Boydell were in demand. The demand was complete succeeding editions of his engravings, the engraving, and his indignation at the opprobrium which foreigners cast upon their countries for the deficiency of their taste in other departments of the fine arts, led him to attempt a similar improvement in the art of painting. For the Wexford Society, a Committee of the fine arts of the kingdom; and selected for illustration the works of Shakspeare, as supplying the most appropriate subjects for etching and displaying, the abilities of each individual. An English school of historical painting was the object. Oil paintings, of every description, Northcote, and others were all employed. Spacesious promises were purchased in Pall Mall, where, in the famous Shakspeare Gallery, were exhibited for several years those paintings which, in the words of Boydell, may with confidence be said to be executed with as much fidelity and peculiar freedom of conception, whatever has issued from the Flemish, French, or Italian schools. The following passage, in an article on the fine arts, in the 'Edinburgh Rev.' (vol. xvi. p. 969), is strangely at variance with the information of all other old opinions on the subject: to national reputation, rejoiced at seeing the Shakspeare Gallery dispersed, and deprived of the means of collectively disgracing his country. The beautiful plates which, under the liberal patronage of Boydell, were engraved from these numerous works of Shakspeare, formed a royal folio, of which the dimensions are three feet by two; the title, 'A Collection of Prints from Pictures painted for the purpose of Illustrating the Dramatic Works of Shakspeare,' was prefixed. In 1801, the British, Boydell, 1853,' A most superb edition of Shakspeare's dramatic works was at the same time undertaken by Boydell, and printed at the press of Bulmer, 1792-1801, in 9 vols. folio. There is a florid description of this magnificent folio, which was published in 1800 in the Critical Magazine, and The Critical Magazine. In 1800 also, he purchased the prints of the celebrated book of Botany, by C. D. Macklin, with which Boydell had nothing to do.

Being now (1804) at the advanced age of eighty-five, and having, in consequence of the commercial obstacles occasioned by the wars of the French Revolution, become involved in unavoidable difficulties, he obtained an act of parliament enabling him to dispose of the paintings of his Shakspeare Gallery by a lottery. In the memorial in the House of Commons he states that his enthusiasm for the promotion of the arts induced him to lay nothing by, but to employ continually the whole of his gains in the further education of these artists with unemployed artists; that the sums he had laid out with his brethren in the advancement of this object amounted to 330,000l., and that he had accumulated a stock of copper-plates which all the print-sellers in Europe would together be unable to purchase. He lived only until the last ticket of his lottery was sold. The affair was finally decided sub-

BOY

sequent to his death, which occurred on the 12th of Dec., 1804. He had been elected alderman in 1782, sheriff in 1785, and mayor in 1790. He held also the office of master of the Stationers' Company. As the most generous promoter of those arts which refine and elevate the moral sentiments of man, he was honoured with a public funeral.

Among the collections published by Boydell was that of 120 engravings from the Houghton Gallery, which was purchased by the Empress Catherine of Russia. In 1771 he had published in fol. the Liber Veritatis, containing copies of 200 of Claude Lorraine's first sketches, in the cabinet of the dukes of Devonshire; in 1794, the 'History of the River Thames,' 2 vols. fol.; and in 1803, in 4to., 'An Alphabetical Catalogue of Plates engraved by the first Artists, from the finest plates of the Italian, Flemish, German, French, and English Schools.'

BOYEAU is any trench executed by the besiegers of a fortress to serve as a covered communication, or line of approach, during the progress of the siege. It receives the denomination of a parallel, an oblique, or a zig-zag boyeau, according to the line of its direction with respect to the general front of the works attacked. [TRENCH.]

BOYER. [Argens, Marquis d']

BOYLE, RICHARD, was born at Canterbury, Oct. 3rd, 1627. He was respectable, and was the name of Bluville had been settled in Herefordshire for many generations; but it was first rendered illustrious by the subject of the present notice, who from having been employed in the service of the chief baron of the Exchequer as a boy, had been at last rewarded with the honour of being admitted to the bar of the court of Exchequer; and they were insufficient to mark the sense which was generally entertained of his abilities, it has been usual to style him 'the great Earl of Cork.'

From Benet College, Cambridge, Mr. Boyle passed to the Middle Temple, having lost both his father and mother; his resources were probably not sufficient for his maintenance during the usual course of study, and he was thus led to offer his services to Sir R. Manwood, at that time chief baron of the Exchequer. The circumstances in which he was placed had afforded him an opportunity for the exercise of his talents, and in his twenty-second year he went to Dublin in question of a suit more suitable to the activity of his disposition. On landing in Ireland, he was not in possession of more than 27s. 3d. in money, and a diamond ring and bracelet of gold, the gift of his mother; and his wardrobe, as he states in the short but instructive memoir which he left of his life, was still slenderly furnished. His confidence arose from his energy and a determined resolution to do his utmost to succeed. His first employment was to draw up memorials and other documents for individuals connected with the government, by which means he acquired considerable insight into public affairs.

He had married one of the co-heiresses of a gentle- man of Limerick, who in admiration of his talents over-looked the inadequacy of his fortune. His wife died in giving birth to her first child, and left him in possession of 300l. a-year arising from landed estates, and a sum in cash besides. He lived with strict economy without being parsimonious, and as land sold at a very cheap rate in Ireland, he increased his property by considerable purchases in Ulster. The envy of several influential persons was excited by his prosperity, and they severally addressed letters to Godolphin, then the principal preacher, but had the occasion's his friend Sir George Carew, the lord deputy of Ireland, knighted him on his wedding-day. In 1666 he was sworn a privy councillor to King James for the province of Munster; in 1612 a privy councillor for the kingdom of Ireland; in 1616 he was created Lord Boyle, baron of Yougball; and in 1620 Viscount Dungarvan and earl of Cork. In 1629 he was constituted one of the lords justices of Ireland; in 1631 lord high treasurer, an office which was made hereditary in his family.

During the reign of Charles I., he inherited the earl of Cork's character and talents, and as an acknowledgment of his services, created the earl's second son then living, Lewis, a child of eight years old, Viscount Kneymleakey. Lewis was killed in the battle of Liscarril in 1642, and his widow was created being then without issue. She married Robert Boyle, who on the death of this able man attained he often looked back with just and gratified pride to the early origin. He selected the following as his family motto, and caused it to be engraved on his tomb: 'God's Providence is my inheritance."

Boyle's son, who died September 25th, 1700, in the seventy-eighth year of his age. His wife, by whom he had fifteen children, died in 1630. (Budget. Memoirs of the Family of the Boyles, 1732; Life of the Hon. Robert Boyle, by
Birch; Memoirs written by the earl of Cork in 1632, called True Remembrances.)

BOYLE, ROGER, fifth son and eleventh child of the first earl of Cork, born April 26, 1621, was created Baron Broghill, almost while in his infancy, by Charles I. He ran away from his father's house, took up the name of Sir John Molyneux of Shankill, married a lady of Rank in Ireland the day after the breaking out of the rebellion, which he displayed great activity in quelling.

The death of Charles I., and the state of his possessions in Ireland, which he almost gave up as lost, induced him to seek redress of grievances, whether in the occupation of the House of Commons, or in the formation of schemes for the restoration of royalty. He had gone so far as to obtain a passport, and was on the point of leaving the kingdom for the purpose of having an interview with Charles II., when his proceedings, and the future course of his life, were laid under the management of Cromwell, who, with the members of the Committee of Public Safety, had become acquainted with Lord Broghill's intentions. Cromwell had been struck with the possibility of securing the services of Lord Broghill in the cause of the Commonwealth, and having the sanction of the members of the committee, he sent a message to his lordship informing him of his desire to wait upon him, and followed his own messenger so quickly, that he entered his lordship's apartments before he had time to deliberate upon the matter. He was then in the rank and file of Cromwell, who, without specific authority, persuaded Lord Broghill that the Committee of Safety were acquainted with his intended movements, which he detailed. Lord Broghill attempted to deny the facts, on which Cromwell produced copies of papers which his lordship had confidentially deposited at the hands of his confidential clerk, and issued in his name. The candid and mangled manner of Cromwell, the just compliments which he paid to Lord Broghill's merits, and the real service which he was doing by protecting him from the consequences of his conduct, completely succeeded in gaining him to his cause. Cromwell received Sir John Molyneux with an army to Ireland, offered Lord Broghill the command of a general officer, with a condition that his services should be limited to the immediate object of the expedition. Lord Broghill, after some hesitation, accepted Cromwell's proposition, which he had been hitherto unable to resist, and was not overrated. On one or two occasions Lord Broghill's boldness and activity were of signal value, especially during the siege of Clonmel, when his vigilance prevented the rebels from forming in the rear of the army during the siege. He was engaged upon this service when he received an urgent message from Cromwell recalling him to Clonmel, the siege of which he feared he should be compelled to raise, as there was much disease in the army, and it had been twice repulsed by the Irish. At the end of three days Lord Broghill returned to the station he had left, and on the way, when Cromwell caused the whole army to salute him by the cry of 'A Broghill! A Broghill!' Lord Broghill himself embraced them, and shortly afterwards, though it was in the depth of winter, Clonmel was taken.

Lord Broghill was one of the privy council, and at the special request of Cromwell he went to preside in Scotland. Richard Cromwell selected Lord Broghill as one of the cabinet council, along with Dr. Williams and Colonel Philips, and more than once his lordship was politically employed in sustaining the Protector's interests. But the impossibility of Richard Cromwell any longer retaining the protectorate becoming soon evident, Lord Broghill, conceiving that the country might otherwise fall into the hands of a cabal of the old party, restored himself to the army. He repaired to Ireland, and by his influence secured the cooperation of some of the most important individuals in the army, and soon after sent Lord Shannon, his younger brother, with a letter encouraging Charles II. to land in Ireland. After the Restoration Lord Broghill was created earl of Orrery, and took his seat in the cabinet council. He also acted as one of the lords justices for the government of Ireland, and was appointed lord president of the province of Munster.

In a leisure which succeeded the active part of his life, the earl of Orrery, at the king's request, wrote several plays. He wrote also some verses on the death of Cowley, and other poetical pieces; a thin folio, on the art of war; and 'Parthenissa,' a large romance in folio, part of which he wrote by desire of Henrietta Maria, daughter of Charles I. These productions have no great merit, and were chiefly written during severe attacks of the gout.

He opposed a petition presented to the king by the Irish Catholics, praying for the restoration of their estates. Mr. Morrice, his private chaplain, asserts in his memoirs of Lord Orrery, that he was offered a large sum of money, and landed property worth 7000l. a year, on condition of withdrawing his petition. In his lordship's address to the privy council the Irish were charged with having broken all the treaties into which they had entered; and with having made an offer of the kingdom of Ireland to the pope, to the king of Spain, and likewise to the king of France to have reduced authentic documents in proof of his assertions. The claims of the petitioners were rejected. The Act of Settlement, which was drawn up by the earl of Orrery, contains stipulations by which those Roman Catholics who had conducted themselves loyally to the Irish were to be rewarded. The historian states that he conceived it highly barbarous to persecute men for any opinions which were not utterly inconsistent with the good of the state; he wished for nothing more than to see a union between the Church and the Dissenters. On the Bill of Exclusion being brought in, he declared himself averse to a change of the succession, but equally ready that, in case of the crown devolving upon a Catholic prince, some restrictions should be provided of a nature equally efficacious.

In a letter of which he presided in virtue of his office of Lord President of Munster, he is stated to have acted with great wisdom and equity.

The earl of Orrery died Oct. 16th, 1679, in his 59th year.

BOYLE, ROBERT, was the seventh son of Richard Boyle, earl of Cork, and was born in 1634. His eldest sister was daughter of Sir Geoffrey Fenton, secretary of state for Ireland. There were fifteen children of this marriage, and the subject of this memoir (the fourteenth) was born on the 25th of January, 1626, at Lismore in the province of Munster. His sister Catherine Boyle married the lady Ranelagh, afterwards mentioned, was considerably older, having been born on the 22nd of March, 1614.

The autobiography and correspondence of Robert Boyle have been almost entirely forgotten in the superior fame which has been given to Robert Boyle the physicist and metaphysicist. If we consider the position in which he stands among our philosophers, it will not appear superfluous, having his own words to quote, if we give the account of his earlier years at some length. The narration in question (in which he calls himself Philosopher, and writes the third person) is prefixed to Dr. Birch's edition of his works in 5 vols., which we here quote once or twice. — The Works of the Hon. Robert Boyle, in five volumes, to which is prefixed A Life of the Author, London, printed for A. Millar, 1744. Of his birth and education there is not much to say. He was educated at Christ Church, Oxford, and fixed himself up to Dr. Birch's edition of his works in 5 vols., which we here quote once or twice. — The Works of the Hon. Robert Boyle, in five volumes, to which is prefixed A Life of the Author, London, printed for A. Millar, 1744. Of his birth and education there is not much to say. He was educated at Christ Church, Oxford, and fixed himself up to
study from the accidental perusal of Quintus Curtius, which first made him in love with other than pedantic books.

He always declared that he was more obliged to this author than to any other. Two years afterwards the Romance of Amadis was put into his hands to divert his melancholy, and by this and other such works his habit of persevering study was weakened. He was obliged afterwards systematically to conquer the ill effects of the fatal regimen, and the most effectual means found to be the extraction of the square and cube roots, and especially those more laborious operations of algebra which so entirely exact the whole man, that the smallest distraction or heedlessness constrains us to renew our trouble, and re-begin the operation. His father had now come to England, and was employed in Dorsetshire; on which account Robert Boyle was soon removed from Eton to his father’s house, and placed under the tuition of the rector of the parish. In the autumn of 1638 he was sent to travel with an elder brother, under the care of M. Marcombes, a Frenchman, of whom he says, with many other eulogies, that ‘if he were given to any vice himself, he was careful by sharply condemning it to render it uninfectious.’ ‘The worst quality he had was his choleric; and that being the only passion to which Philestes was much observed to be inclined, his desire to stung clashing with his governor, and his accustomedness to bear the sudden sallies of his impetuous humour, taught our youth so to subdue that passion in himself, that he was soon able to govern it habitually and with ease.’ It had been intended that he should have served in the dragoons; but before this thought was raised, but the illness of another brother prevented this. He travelled through France, and settled with his governor at Geneva, for the prosecution of his studies. A thunder-storm which happened there in the night was the cause of their departure, as the thing was thought to happen in his life, and, it should be added, without giving into either the fanaticism or the intolerance of his contemporaries. He carried his theological studies to considerable depth. He cultivated both Hebrew and Greek, though a proficient in the latter of verbal studies, that he might read the originals of the Scriptures. On this subject he remarks in his manuscripts (Works, vol. i. pp. 29, 30)—‘When I have come into the Jewish schools and seen those children that were new born for more than an hour, they broke up to speak (what hath been particularly called) God’s tongue as soon as their mother’s, I have blushed to think how many gentlemen, that boast themselves to be the true Israelites, are perfect strangers to the language of Canaan; which I would not have been able to pay God the respect usual from civil inferiors to princes, who otherwise would not have found a way to converse in their own languages. And I confess myself to be none of those lazy persons that seem to expect to obtain from God the knowledge of the wonders of his book only by easy terms as Adam did a wife by sleeping profoundly, and having her presented to him at his awaking.

In September, 1641, he left Geneva, and travelled in Italy, where he employed himself in learning the language, and in the study of the works of the great star-gazer Galileo, whose ingenious books, perhaps because they could not so otherwise, were confuted by a decree from Rome; his highness the pope, it seems, presuming, and that justly, that the infallibility of his chair extended equally to determine laws and as in religion, and that the sum of stability of that earth then was such that was not balanced his kingdom. Having seen Florence, Rome, and Genoa, he came to Marseilles, and here his own narrative ends. At Marseilles he was detained for want of money, owing to the state of England; however, procured funds from his governor, he returned to London, where he found (in 1644) his father dead, and himself in possession of the manor of Stalbridge, with other property. At that place he resided till 1656, not taking any part in public business, but devoting himself to the science of philosophy in both parties, whereby his property received protection from both. The epistolary correspondence of Boyle is amusing, and furnishes one of the earliest specimens of the lighter style. Considering the formality of the age, and the then state of the art of correspondence, the letters which give from a letter to Lady Ranelagh will appear original; while the letter immediately following, written from Boyle when at Eton to his father (stated to be taken from the original in the Brit. Crit.) will show the manners of the time:—

‘My most honoured Lord Father, heartily praying for the continuance of God’s favour to your Lordship still in soul and body, I humbly prostrate myself under the pardon for my remissness, in presenting my illiterate lines unto your honorable kind acceptance. Whereas I have been heretofore cloyed with our college exercise, I could not so often visit your Honour in writing; but now being placed in the true station of a scholar, and the license of Sir Harry Wotton, and our schoolmaster, come to London, where we make four days’ residence, have found opportunity to offer unto your Honour that oblation due unto so good and so noble a father, that is most humble duty: desiring your Honour to pardon him for his levity, who strives to do your Lordship’s will and commandments.

London, decimo 4to Martii. ROBERT BOYLE.

Superscribed, For my dear Lord Father, the Earl of G—.

The following is a part of his account of his first journey to Stalbridge, written to Lady Ranelagh, March 30, 1646:—

‘As we went along, we met divers little parties, with whom we exchanged fears, and found that the malignant humours, which were then abroad, had frightened the country into a shakingague, till we got to Fencham, which we found empty and ungarded. With divers contemplations upon this subject, I went to supper, and thence to bed, not without some little fear of having our quarters beaten up by the cavaliers that night; when lo! I second my apprehensions, and heard a violent knocking at the door. It was the night, I heard a thundering at the door, as if they meant to fright it out of the hinges and us out of our wits. I presently leaped out of my bed, in my stockings and clothes (my usual night-posture when I travel), and while Roger was lighting a candle, got my Bible, and other instruments from under my pillow; whereupon Roger opening the door, saw it beset with musketeers, who no sooner saw us, but said aloud that we were not the men they looked for; and being intreated to come into the chamber, restored to us all that brought them there. I was not a little troubling us with as transcendent compliments as the brown bill could afford. I wondered at their courtesy till I knew that it was the town constable, that, making a search for some suspicious persons, and coming by my chamber, that wanted a lock, either had a mind to make us take notice of so considerable an officer, or no mind that we should sleep while our betters watched; and for his not coming in, some accents of fear that fell from him made me suspect I was obliged for that to myself; and I remember that he espied me drawing a pistol out of one of my holsters, which I believe made him so niggardly of his company. The next day we dined at Winchester, and ever and anon, by the trembling passengers we met, were as nicely catechized concerning ourselves, as if we were some number of the new lay elders. From thence we reached Salisbury that night, though before we came thither, we were fain to pass in the dark through a wood, where we had warning given us that about an hundred woodmen (we were not the English) lay there, where these night-birds used to exercise their charity, in easing weary travellers of such burdensome things as money and portmanteaux. But coming nearer, and knowing the state’s messenger, as he called himself, they drust not meddle neither. And so on the 27th of April, 1646, we arrived in London, very lovingly; and had we not been there, would, I believe, have opened to search for malignant letters, such as use to be about the king’s picture in a yellow boy. I am loaded with civil language and fair promises; but I have always observed that in the poor, and the meanest, are so close and thick written with promises, that there is no room left for such a word as performance.

From this time to the end of his life he appears to have been so engrossed in study. His chemical experiments date from 1646. He was the first manager, as he calls it, which has since become the Royal Society. The rest of his public life is little more than the history of his printed works, which are voluminous, and will presently be further specified. He must have written with singular facility, for an article of 1800 lines, as appears on the face of it, in the morning, previously to making his preparations for a journey in the afternoon, is of a length which would occupy five columns of this work.
After various journeys to his Irish estates, he settled at Oxford in 1644, where he remained till 1668. Here his life ('Works,' vol. i.) states him to have invented the air-pump, which is not correct, though he made considerable improvements in it. ['Air-Pump.'] On the accession of Charles II., he left Oxford, where he took up his abode with Lady Ranelagh, in London, and in 1653 was one of the first council of the newly incorporated Royal Society. In the year 1666, his name appears as attesting the miraculous cures (as they were called by many) of Valentine Greartrafts, and a band of associates of such number as to give them the appearance of giving many hands the means of giving patients almost instantaneous relief. This gentleman, Mr. Greartrafts, a man of respectable family, and an Irish magistrate, (whose printed letter to Robert Boyle, besides being accompanied by the testimonials of himself and others to facts, is, as far as such a thing can be, evidence of good faith by its style and documents,) one day believed himself enabled by the power of God to cure diseases by his touch, and whatever the cause might be, has left sufficient evidence at least to the personal testimony of his. Therefore, Boyle did shortly leave those who suffered from them. Mr. Greartrafts published his letter to Mr. Boyle in 1666, and some remarks written in the fly leaf of a copy we have seen will make a good résumé of the state of the evidence. 'In looking into the account given in this letter, it is necessary to observe that they are by the most learned and philosophical individuals of that period, it is impossible to deny the existence of the facts as attested, without rejecting in toto the evidence of every historical record. Credulity may have distorted and exaggerated the alchemical process; but the facts recorded by Boyle, Cutworsh, Wilkins, Patrick, &c.; but doubtless the facts are essentially true as reported, and as certainly to be accounted for on the principle of mental and physical sympathy, the imagination of the patient being wrought upon by a sort of magnetic attraction.' The writer thus impugned the hundred works of the most philosophical and scientific physicians might be cited in confirmation of the astonishing effects of that agitating excitement of the nervous system produced by operating upon the imagination: 'which perfectly explains all the wonders of animal magnetism.' We may add that the phenomena certainly witnessed at the tomb of the Janseni Abbe Paris were not better attested, and were less extraordinary in degree, than those in question; and that, as we shall see, all of the men of his time. Robert Boyle, by his experiments, showed the value of the innocent, social, in the service of his country, and it was deemed desirable to have. The reputation of Mr. Greartrafts extended through the three kingdoms, and Flamstead, among others, ('Baily's Flamstead, p. 12,) was among the number of those who went to Ireland to be touched, and called in vain for the cure. Mr. Boyle himself also received benefit himself, but whether from the touch or from subsequent sea-sickness, he is not certain, but judges from both. At the same time, in illustration of what we shall presently have to say on the distinction between Boyle as an eye-witness and Boyle as an exponent of evidence, we find him in 1669 not disposed to receive, and that upon the hypothesis implied in the words, the 'true relation of the things which an unclean spirit did and said as Mascon, in Bur- gundy, &c.' That he should have been inclined to prosecute inquiries into this mysterious and ambiguous state, it is necessary to consider the state of chemical knowledge in his day; and we find even Newton inclined to fear, from the result of some experiments of Boyle, (the results of which only had been stated,) and to speak in time, as once became one who should afterwards be master of the mint, a word in favor of the curacy. In a letter to Oldenburg, dated 1676, Newton writes thus: 'Yet but because the way, by which mercury may be so impregnated, has been thought fit to be concealed by others that have known it, and may therefore possibly result to the prejudice of the noble author to whom it is dedicated without immense damage to the world, if there should be any verity in the Hermetic writers; therefore I question not but that the great wisdom of the noble author will sway him to high silence, till he shall be resolved of what consequence the thing may be, either by his own experience, or the judgment of some other that thoroughly understands what he speaks about; that is, of a true Hermetic philosopher, whose judgment (if there be any such) would be more to be regarded in this point, than that of all the world besides to the contrary, there being other things beside the transmutation of metals (if these great pretenders brag not) which none but they understand. In all this, because the thing is not the subject of controversy in this point, I have been so free as to shoot my bolt; but pray keep this letter private to yourself. Your servant, ISAAC NEWTON.'

It appears that both Boyle and Newton were started with the result of the experiments of the former; and the treatment which old believers in alchemy have experienced from the present age will render it no less than just to say, that faith in alchemy now, and the same in the middle of the seventeenth century, are two things so different in kind, that the same ridicule, which in both is shown nothing but the ignorance of the laugher.

Boyle had been for years a director of the East India Company, and we find a letter of his, in 1676, pressing upon that body the duty of promoting Christianity in the East. He caused the Gospels and the Acts of the Apostles to be translated into Malay, at his own cost, by Dr. Thomas Hyde; and he promoted an Irish version. He also gave a large reward to the translator of Grotius De Devertato, &c. into Arabic, and would have been at the whole expense of a translation of the Gospels, if he had not been prevented by the king's blessing him of a part. In the year 1680 he was elected President of the Royal Society, a post which he declined, as appears by a letter to Hooke. ('Works,' i. p. 74,) from scruples of conscience about the religious tests and oaths connected with the patent and charter of the Society. He received a high tribute from his manuscripts had been lost or stolen, and others mutilated by accident; and in 1689, finding his health declining, he refused most visits, and set himself to repair the loss. In that year, being still in a sort of expectation that the King's health might return, he ventured on the repeal of the statute 5 Hen. IV., against the multiplying of gold or silver, and what was still more useful, the same statute contains a provision that 'no mine of copper, &c. shall be adjudged a royal mine, although gold or silver may be found in it.' He now began to assume a more serious character. Lady Ranelagh died on the 23rd of December, and he followed her on the 30th of the same month. He was buried at St. Martin's in the Fields, Jan. 7, 1692, and a funeral sermon was preached on the occasion by Dr. Burnet, with whom he was a close friend, and to the expenses of whose history of the Reformation he had largely contributed.

Boyle was never married. In a letter to his niece, Lady Barrimore, on a rumour of the kind, he says, 'You have no idea of the happiness of a single life. Nothing is so desirable as to be unengaged. Single life is one of the greatest blessings that a man can possibly have.' He was never married. He was unengaged. His reputation is one of the greatest blessings that a man can possibly have. He was never married. He was unengaged. His reputation is one of the greatest blessings that a man could possibly have.
and Newton and Boyle together. The merits of Boyle are indeed singular, and almost unprecedented; his discoveries are in several cases of the highest utility: but we do not think the inference that they were the result of a reasoning power, or a distinctive sagacity, of the highest order, is at all justified. He has not been corrected through the medium of the world. His understanding in the first place, and proportionately in all the things they all agreed in, also regulated his views of philosophy; so that he tossed Laud and Paracelsus on one side, Pyrane and Descartes on the other, and began to investigate for himself, on the simple principle of examining closely and strictly, into the nature of the things themselves. This reminds us strongly of those of Roger Bacon: they are all of full senses of views and experiments of his own, and of absurdities derived from the relation of others. He leans too much, for one of our day, to the attempt to discover the fundamental qualities of matter, instead of endeavouring to connect and classify what he had actually observed. And what we maintain is, that his discoveries do not show him to have that talent for suggestion and power of perceiving points of comparison, which is the distinguishing attribute of the greatest discoverers. To take an instance: in his experiments 'showing how to make flame stable and ponderable,' he finds that various substances gain weight by being heated. He states it in an exact, rational, and conclusive manner; he does not relieve the anxiety of the philosopher by the assurance of the chemists, that an offlux of the fire, will be, what chemists would call, corporated with metals or minerals exposed naked to its action. But it never suggests itself to him, that the additional substance added to the metal or mineral may be air, or a part of air. When a character has been overrated in any respect, the discovery of it is usually attended by what the present age calls a reaction: the pendulum of opinion swings to the side opposite to that on which it has been unduly brought out. Our author's instructive discourse prefixed to the Supp. Ense. Britanniæ, Mr. Brande speaks thus: 'Boyle has left voluminous proofs of his attachment to scientific pursuits, but his experiments are too miscellaneous and desultory to have afforded either behalf or usefulness: his Chemicals are seldom satisfactory; and a broad vein of prolixity traverses his philosophical works. He was too fond of mechanical philosophy to shine in chemistry, and gave too much time and attention to theological and metaphysical controversy to attain any excellence in either, or furnish any immediate aid to science, which is surely too much. Perhaps it will be a fair method to take a foreign history of physics (where national partiality is out of the question) and try the following point:—What are those discoveries of the Briton of the seventeenth century which have been of most durable worth omitted or deformed in a Frenchman of the nineteenth? In the Hist. Phil. du Progrès de la Physique, Paris, 1816, by M. Lubes, we find a chapter devoted to the 'Progrès de la Physique entre les mains de Boyle;' and we are told that the air-pump in his hands became a new machine—that such means in the hands of a man of genius multiply science, and that it is impossible to follow Boyle through his labours without being astonished at the immensity of his resources for tearing out the secrets of nature. The propagation of sound by the air (the more creditable to Boyl, because of these, had been led astray as to the cause), of the absorbing power of the atmosphere, of the elastic force and combustive power of steam, of the approximation to the weight of the air, the distinction of electric and non-electric body, are mentioned as additions to the science. Between the character implied in the two preceding quotations, we have no doubt the true one is to be found. But there is a peculiar advantage consequent upon such a labourer as Boyle in the infancy of such a science as chemistry. Here we observe facts of such common occurrence, and the phenomena of which are so distinctly understood, that any theory receives something like assent or assent, and may be received as such. After a long series of years, the chemist is most likely to think himself found, whatever he has discovered, and will spend his time merely in refining, or in setting forward the facts discovered, as he has discovered, and will spend his time merely in refining, or in setting forward the facts discovered, for the sake of his admired author. Whatever he has discovered, he must have originated to chemistry research in the same relation as the objects of botany to those of mineralogy: the first presenting themselves, the second to be sought for. The mine was to be found as well as worked; and every one who does not suppose that the chemists are brought forward by showing at least one place where it was not. In this point of view it is impossible to say what degree of obligation chemistry is to limit its acknowledgments to Boyle. Searching every inlet which phenomena presented, trying the whole material world in detail, and with a desire to be accurate in every act of his, as truly discovered, it cannot be told how many were led to that which does exist, by the previous warning of Boyle as to that which does not. Perhaps had his genius been of a higher order he would have made fewer experiments. He was admirably fitted for the task he undertook, and no one can say that his works, the eldest progeny of the 'Novum Organum,' were any thing but a credit to the source from whence they sprung, or that their author is unworthy to occupy a high place in our Pantheon, though not precisely on the grounds taken in many biographies or popular treatises.

The characteristics of Boyle as a theological writer are much the same as those which appertain to him as a philosopher. It is characteristic of his writings that he renders a firm faith, and preserves a quiet and argumentative tone throughout. In his discourse against customary swearing, written when he was very young, he shows a little of the vein which distinguishes his letters: but the very great prolixity of his style, which renders a firm and quiet faith, and preserves a quiet and argumentative tone throughout. In his discourse against customary swearing, written when he was very young, he shows a little of the vein which distinguishes his letters: but the very great prolixity of his style, which renders him sometimes tedious and at others, as he informs us in his youth, a writer of verses, and one fancy-piece in prose, 'the Martyrdom of Theodora,' has been preserved, wherein his hero and heroine make set speeches to each other, of a kind somewhat like those in the plays of his days. And this is in another play also, until the executioner relieves the reader. His 'Occasional Reflections' have fallen under the lash of the two greatest satirists in our language, Swift and Butler, in the 'Pious Meditation upon a Broomstick' of the former, and an 'Occasional Reflection on Dr. Charlton's feeling a dog's pulse at Gresham College,' published with the posthumous writings of the latter. The treatises 'Seraphic Love,' 'Considerations on the Style of the Scriptures,' and the great Veneration that Man's Intelect owes to God, have a place in the course of the 'Register' of the University. The 'prohibitorum' of the Roman Church. (Kippis, 'Bibl. Brit.').

The 'Boylean Lectures' were instituted by him in his last will, and endowed with the proceeds of certain property, as a salary for a 'divine or preaching minister,' on condition of his delivering a sermon on the debt of gratitude in the Christian religion against notorious infidels, viz. atheists, theologians, pagans, Jews, and Mahometans, not descending lower to any controversies that are among Christians themselves. The minister is also required to promote the propagation of Christianity, and answer the scruples of all who apply to him. The stipend was made perpetual by Archbishop Tenison, Mr. Bentley was appointed the first Boylean lecturer. We shall not give a detailed list of all the titles of Boyle's works, which would occupy much room to give, but shall merely mention that he wrote for a very rare and scarce in the English rare volumes folio, and contains the life which has furnished all succeeding writers with authorities, besides a very copious index. The collection of letters in the fifth volume is highly interesting. The second complete edition was published in 1772. The first complete edition was published in 1744 by Dr. Birch, as already noticed. The second complete edition was published in 1798. As far as may be, the works have been variously and scatteredly published, with abridgments and good indices added, but we cannot find any references to the originals. There is a list of Boyle's works in Hutton's mathematical dictionary, and another in Moreri. There
is a copious life, taken mostly from Dr. Birch, in the Biogr. Brit., and the same with some additions in Dr. Kippis's unfinished reprint.

It will be useful to remember as to contemporary chro-
nology, that Boyle was born in the year in which Bacon died, and Newton in that in which Galileo died; Boyle being fifty years older than Newton.

BOYLE, CHARLES, second son of Roger, the second earl of Orrery in Ireland, was born at Chelsea, August, 1676. He was entered, in his fifteenth year, at Christ Church, Oxford, as a nobleman. The directors of his studies were Dr. Burnet, afterwards Bishop of Rochester, and Dr. Friend, the eminent physician, or, as others say, his brother, the master of Westminster school. The elevated rank and accomplishments of their pupil appear to have given the highest satisfaction to the master of the college, Dr. Aldrich, for in his account of the college, he says: 'I have adopted as the Oxford University text-book, he declares him to be 'magnus aestro nostro monumentum.' It is requisite here to say a word or two in explanation of the circumstances which gave rise to the famous controversy ostensibly sustained by the Hon. Charles Boyle against the great Aristarchus of Cambridge, Dr. Bentley, but which in reality was an affair with which Boyle himself had almost nothing to do. In addition to the particulars in the article on Bentley, p. 250, concerning the origin of this fierce contention of wit and learning, it may be added that the two learned men whose names are so frequently met with in connexion with this contest, were both anxious to promote the reputation of their college, encouraged the students in the practice of editing, every year, some antient classic author; and as Sir Wm. Temple, in his 'Essay on Antient and Modern Learning,' had just then asserted (Works, I. 350), that 'the Town in which the original had still in their kind the best; the two most antient in prose are 'Æsop's Fables' and 'The Epistles of Phalaris:' the latter exhibit every excellence of a statesman, soldier, wit and scholar; I think they have a greater force of wit and genius than any book of that kind that has yet been translated. These two Greek relics of antiquity, which Temple imagined to be of the age of Cyrus and Pythagoras, were chosen as subjects for the stirring Christ-Church editors. 'Æsop was published by Alsius, and Phalaris by Boyle, who was then at the age of twenty-three. The 'Epistles of Phalaris' was published by gentilum Tyrannorum Exempla ex MS. recognitum, annotationibus et vita insuper authoris donavit Car. Boyle: ex Ædio Chriati, Oxon., 1693.' In the preface it is stated, that the text was collated only partially with the MS. in the King's Library, because the librarian (Bentley) had the singular kindness to refuse the use of it for the requisite time; the words are 'pro singulari sui humanitati negavit.' This petulant passage is said to have been occasioned by Bentley's reminding, at the time of lending the MS., that it was a special work, the first of its kind at that period, and most of these two Greek relics of antiquity, which Temple imagined to be of the age of Cyrus and Pythagoras, were chosen as subjects for the stirring Christ-Church editors. 'Æsop was published by Alsius, and Phalaris by Boyle, who was then at the age of twenty-three. The 'Epistles of Phalaris' was published by gentilum Tyrannorum Exempla ex MS. recognitum, annotationibus et vita insuper authoris donavit Car. Boyle: ex Ædio Chriati, Oxon., 1693.'

In his 'Epistolary Correspondence,' vol. i. p. 1-22, upbraid Boyle with ungratefully requiring his services in planning, writing half, and correcting the whole of the 'Examination.' See also Warburton's 'Letters,' svo, p. 11, for a confirmation of the fact that all the wit and erudition displayed under the name of Charles Boyle, was the produce of his father. Dr. Friend, who wrote with his brother, Dr. Boyle, in his Biogr. Brit., asserting that 'Mr. Boyle wrote extremely well in defence of his performance;' and the polite Dr. Felton observing that 'if we own Dr. Bentley is the better critic, we must acknowledge that his antagonist is much the better detached writer.' The truth is, the united efforts of the Oxford scholars resulted in total failure. 'In many parts of the Examination,' says Bishop Monk, 'the critics seem to have parted too soon with their grammars and lexicoms.' It occasioned, however, at the time, a very great sensation, and it is facetiously said, as it was for though it left unimpaired the main arguments of the 'Dissertation,' yet, abounding in ready wit and satirical vivace, it procured for the young nobleman of Oxford a temporary triumph. Bentley put forth, in 1699, his 'Dissertation' enlarged and separately printed: it effected the most complete demolition of the Oxford wits, who threatened but never attempted an answer. For many interesting particulars of this memorable controversy, see Dr. Monk's 'Life of Boyle,' 4to., p. 43-107; D'Israeli's 'Quarrels of the Time,' 1846, p. 152 seqq., and Dr. Warburton's 'Letters,' svo. Boyle, in 1700, was elected a member of parliament for Huntingdon: and, in consequence of a quarrel with his opponent, Mr. Wortley, he fought a duel with him in a gravel-pit near Grosvenor Gate in Hyde Park, an affair which occasioned great excitement. The duel was fought, however, beyond the bounds of the law, and it was not till 1703 he succeeded to the title of earl of Orrery. He entered the service of Queen Anne, received the command of a regiment, and was made a Knight's Companion of the order of the Thistle. In 1709, as major-general, he fought with the title of chief at the battles of Marston Moor and Chelsea. After the death of Marlborough and Prince Eugene, at Malplaquet, near Mons, in Belgium. On his return to England he was sworn a member of the privy council, and sent, at the time of the treaty of Utrecht, in 1713, as envoy extraordinary to the Court of Rome, to which office he was appointed at the instance of the Pope. An occasion he was raised to the English peerage with the title of Lord Boyle, Baron of Marston, in Somerset. On the accession of George I. he was made a Lord of the Bedchamber, and became a confidential favourite at court. In September, 1722, he was abruptly committed to the Tower on a charge of high treason, as an accomplice in the sedition called Layer's Plot. After six months' imprisonment he was bailed by Dr. Mead and others, and was ultimately acquitted. He amused himself in the latter part of his life with some literary and philosophical works, and was an enthusiastic and ingenious watchmaker, who constructed the mechanical instrument representing the planetary revolutions, and in gratitude to his benefactor, gave it the name of an Orrery. 'The whole merit of inventing it belongs,' says Dr. Johnson, 'to Bowley, a mathematician of Lichfield.' (Ibid., vol. ii. Suppl. Swift's Works.) In the 2nd vol. of the works of Roger earl of Orrery, are several literary compositions of Charles Boyle; among other tritres, a comedy called 'As you find it.' He published also a volume of Occasional Poems and other works, of which Sir Richard Blackmore has the following instance:—

"After his foolish rhymes, both friends and foes
Conclude they knew who did not write his prose."
Marston, Somersetshire, Nov. 16th, 1762, in his 56th year. In 1774 appeared a volume entitled 'Letters from Italy,' which he had written while residing in that country in 1754–5.

Boylston, Zabdiel, an American physician, was born in the state of Massachusetts, in 1684. He was the first to introduce inoculation into New England, where the practice became general before it was common in Great Britain. In 1721 the small-pox broke out at Boston in an alarming manner, when Dr. Cotton Mather pointed out to the President an account of inoculation as practised in the east, which was contained in a volume of the 'Transactions' of the Royal Society. Notwithstanding the ridicule with which his medical brethren treated this mode of counteracting a virulent disease, Boylston had the courage to inoculate his patients. In the year 1722 the practice of inoculation spread, and, with one or two exceptions, it was attended with the most successful results. But such were the obtrusive prejudices of the profession and the public generally, that clamours were raised against Boylston, and his life was in danger, consequent on the excitement of a popular feeling; even the 'select men' of Boston passed a by-law prohibitory of inoculation. It was alleged that the practice increased the probabilities of contagion, and also that the disease being a judgment from Heaven on those who introduced inoculations to America, was a part of its wrath. Boylston outlived these prejudices, and acquired a considerable fortune by the successful practice of his profession. During a visit which he paid to England, he met with great attention, and was elected a fellow of the Royal Society. He returned to America, and in 1729 published his 'Transactions.' He was the author of two works relating to the small-pox (one a pamphlet published at Boston), both of which are in the library of the British Museum. The other was a romance, published in London, during the visit which he paid to this country.

Boyne, a river of Ireland; rises near Carberry, in the barony of Carberry and co. of Kildare, whence, flowing W., not far from Edenderry in the King's County, it receives the waters of the river Meath, N.W., the river Erne, N., and the river Weir, N. E., all of which are tributary to the Liffey, N. of the line of the Grand Canal; then, turning to the N. E., which direction it keeps throughout the remainder of its course, it receives the Yellow and Milltown rivers out of the bogs extending from Cloghan hill to Tyrell's Pass in the co. of Westmeath. Soon after this it enters the co. of Meath at Clonard, crosses the Royal Canal, and receives the Deel, a large stream flowing parallel to the Yellow River from Mullingar in Westmeath. The Boyne having now left the marshy shores of the bog of Allen flows through the rich pastures of Meath, past the water of Nine Milehill till, passing Trim, where its banks are crowned with the lofty ruins of numerous abbeys and castles, it sweeps past the base of Tara hill in a more northerly direction to Navan, where it meets the Blackwater, descending by a S.E. course from the lake of Virginia on the confines of Cavan and Meath, but in its navi- gation at a distance of 25 English m. direct from the sea, and resuming a more E. course by Slane and Oldbridge proceed along the S. part of the co. of Louth to Drogheda, and thence to the Irish channel, which the Boyne enters after a windsing course of about 48 Irish m. or 60 English from its source. The navigation of the Boyne from Drogheda to Navan was effected by a company in 1770. An extension of the line to Trim and Athboy was projected, but never carried into execution. The whole navigation of near 26 m. from Drogheda to Navan is under the charge of the directors of the company (The Boyne Navigation Company); but the title of the company to levy tolls being disputed, it was decided that the lower 12 m. from the Carrickdexter Lock to Drogheda was legally vested in the Irish Board of Works, which accordingly took possession in August, 1834. The Boyne divides the co. of Meath diagonally into two nearly equal parts. Its whole course through this co. affords rich landscape scenery, the descent of the river being in general gradual, and the banks abound with numerous colonies of trees. The river has been called the 'Boyne of Science' from the number of monastic institutions on or not far from its banks, among which may be enumerated Clonard, Trim, Beechtree, Donaghmore, Slane, Mellifont, Monasterboice, and the various religious foundations of Drogheda.

The Boyne however derives its chief interest from the important battle fought upon its banks on the 1st July, 1690, between the English army under William III. and the Irish under James II. The Boyne between Slane and Drogheda, a distance of 6 m., is fordable at three points; one below the bridge of Slane, another at Rosnaare, about a mile farther down, and a third opposite the little village of Oldbridge and hill of Donore, 2 m. to the W. of Drogheda. Here the Boyne branches, and a sweep and forms two small islands in front of Oldbridge; the banks here rise gradually towards the hill and church of Donore on the S. side, and along the beautiful ravine, still called King William's Glen, towards the ruined castle they are terminated by a thick wood. In the year 1798 the Irish army marched from Carrickfergus, where he had landed on the 14th of June, mustered his force of English, French, Dutch, and Danes at Dundalk on the 27th, and finding that the Irish had retired beyond the Boyne, moved forward on the 30th, and crossed the river at Donore. The battle was fought on the 1st July, on the south side of the river between Mellifont and Drogheda. William had with him the Duke Schomberg and his son Count Schomberg, Generals Ginkel, Douglas, and Kirk, and other distinguished persons. James, accompanied by the Dukes of Berwick and Tyrconnell, the Generals Hamilton, Sarsfield, and Dortingon, and the Count Lauzan, was encamped along the opposite bank with 27,000 Irish and French prepared to dispute the passage of the fords at Oldbridge, while Lord Ivenagh, occupying Drogheda on the N.E. side, was in readiness to cut off any retreat. On the evening of the 30th, while William was yet undecided what course to pursue, he rode down with his staff within range of the Irish lines, and some field-pieces being brought to bear upon his party, he was in imminent danger of being shot at point blank. He then ordered his regiment to form line, to which was added a light dragoon regiment, and was dressed in a red coat and lacerated his shoulder. On this the English artillery was brought up and a brisk cannonade was commenced across the river, but no further step was taken by either army until the next day. On the morning of the 1st July, the English were formed in line, and Generals Douglas and Count Schomberg were dispatched with a body of 10,000 horse and foot to cross the fords below Slane. On the other side, a body of 5000 French foot, supported by Sir Neal O'Neill's dragoons, moved from the left. On reaching the river the French were met by the fire of the Irish, and their ford was soon effected; Sir Neal O'Neill fell and the head of his regiment on the first charge, and after a sharp dispute upon the bank, General Douglas made good his position against the French infantry. The success of this movement, so far, being announced to William, he gave the word to his centre, composed of the Dutch guards, the Enniskillen infantry, and two regiments of French Huguenots, supported by Hamer's and Count Nassau's dragoons, to cross the river opposite Oldbridge, where the Irish centre lay partly under cover of ditches and breastworks, and partly exposed to the fire of the French. The Men on the left bank of the river first, above the little islands; the French and Enniskillen crossed by the upper island of the two, and the Danish cavalry between them. The Dutch, although warmly received, succeeded in dislodging their opponents; but the French were broken by a charge of horse led by Lord Byron, Sir Alexander Parker, and M. Callernot their commander was slain; one squadron also of the Danish horse was driven back across the river by Hamilton's dragoons, and Count Nassau's cavalry with difficulty withstood several trying attacks of the Dutch and Young's guards. While the conflict was here at its hottest, William, at the head of the cavalry of his left wing, crossed the river a little below, and came to the support of his centre. Just about the same time Duke Schomberg, who commanded the reserve, crossing opposite Oldbridge to the help of the French, charged to the support of Lord Byron, and Mr. Walker, celebrated for his heroic defence of Lendonderry, fell shortly after. The Enniskillen regiments, which had fallen back, is said, through mistake, now rallied, and animated by the presence of William, charged the ranks of the French and Danish cavalry, while the Dutch, who were on Oldbridge by the Dutch, began to fall back on Donore hill, where James is asserted to have stood during the engagement an idle spectator of their struggles in his cause. The French however the Irish rallied, and repulsed a charge made by General Ginkel and his division. The head of his regiment General Hamilton was taken prisoner, and his men were driven back with considerable loss. At the same time General Douglas, higher up the river, had pushed the French foot from their position, and was pursuing them towards Duleek, a town upon the road to Dublin about 4 m. in the rear. Hither the whole Irish army shortly after began to direct their retreat, which was
covered by the duke of Berwick, while Sarsfield conducted James from the field under the protection of his own regiment of cavalry. The English, concentrating their forces on the enemy, pursued them to the river near Duloeck, where the duke of Berwick, after crossing the stream in considerable confusion, rallied once more upon the opposite bank, and ordered the vanguard to make a stand where shipping had been prepared to carry him to France. His army, freed from its irreligious councils, retired upon Athlone, and thenceforth fought with vigour and determination. An obstinacy of grand proportions was erected in committee of the battle of the Boyne in 1736. It immediately faces the ford at Oldbridge, marking the spot where William received his wound on the evening before the engagement. It is 150 ft. in height, by 20 at the base. Oldbridge, although only a ford in 1690, had been the site of a bridge at a very early date, for its name, which indicates as much, is found in the patent rolls so far back as the reign of Richard II. The Boyne is also rendered famous in more ancient history by the invasion of Turguesius the Dane, who sailed up with it a fleet of Norsemen to the plunder of Metha a.p. 838. It is a deep and wide river, and it is supposed that vessels of large form would be capable of receiving vessels of much greater burthen were the bar which now obstructs its entrance partially removed. The total descent of the river is 336 ft. (Stat. Surv. of Meath; Reports on Irish Bogs; Storey’s Impartial Narratives; Twiss’s History of Ireland; Post Chaise Companion.)

BOYSE, SAMUEL, a writer of considerable poetical talent, but remarkable chiefly for the singular contrast of his elevated imagination and rectitude of moral sentiment, as displayed in the ‘Friend’ and the ‘Artist.’ He was born in Dublin, in 1705. Being destined for the pulpit, he was sent by his father to the University of Glasgow, where, after spending a few months in idleness, he married while yet in his teens; and, with his wife and her sister, who in dissipation and idleness were similar to himself, he returned to Dublin, and occasioned by his disolute conduct the ruin and death of his father, who, as a pauper, was buried at the expense of his congregation. He then went to Edinburgh, and published in 1734 a “Lamentation” on the death of his mother, of which a dedication to the Countess of Eglinton, who, with Lord Stormont (on the death of whose lady, Boyse had published a laudatory elegy) patronised him, and kindly recommended him to Lord Mansfield and the duchess of Gordon, by whom, and also by Lords Stair and Townshend, he was engaged as a tutor to the Lord Chancellor, Sir Peter King, Pope, and other important personages in England, whither he removed, to escape from the importunity of his creditors in Scotland. But his indolence and aversion to refined society defeated the friendly intentions of his patrons; so that, resorting to a squallid garret in London, he relied upon the sale of his verses and the charitable donations of literary individuals, whose compassion he excited by the most scoriv and pathetic protestations of his miserable condition. In 1740 he published a religious poem entitled ‘The Vow,’ which was favourably noticed by Fielding (see a periodical called ‘The Champion,’ Feb. 12, 1740; and ‘Tom Jones,’ b. vii. c. 1.) and by Hervey (Medit. vol. ii. p. 239, ed. 1767). It has been reprinted in several collections of the minor poets. (in order to be noticed by some of the subscribers, ‘The Vow’ is sublime and beautiful. It is one of the numerous attempts at poetical sublimity in which the most ridiculous faults are tolerated solely on account of the subject. The following lines from the poet’s invocation of his muse are a fair specimen of that which almost deters the literary of admiration than intelligible and consecutive ideas—

‘Then present were when forth the Almighty rod, When Chie trobled at the voice of God.’

‘Where art thou, O Lord, when I need thee? When Nectar from his word existance knew?’

To the atheist the author explains—

‘Goli all the sightness realms of spase survey!’

The devotional reflections, though incoherent, and made often apparently to furnish a rhyme, display an occasionnal energy of poetical conception which even Pope declared he was not born. But we can feel only disgust at the pious pretensions of a man who, often with a guinea obtained by employing his wife to write mendicant letters, could gratify his sensuality at a tavern while she and her child were suffering with cold and hunger; and who, in order to indulge in the vices of a rake, had to borrow all the money he received the wages of her prostitution. Boyse was a very copious contributor of verses to the ‘Gentleman’s Magazine.’ For these compositions he was paid per 100 lines: they have the signatures X and Acelum; and, if collected, would form about six 8vo volumes. Among other publica- tions are ‘Albion’s Triumph,’ a poem on the battle of Det- tingen; ‘An historical Review of the Transactions in Europe during 1739-45; ‘Chaucer’s Tales in modern English,’ &c. He was not deficient in ability as a classical scholar, and a translator of German, Dutch, and French; but his invariable habit of drinking hot beer in the lowest pothouses at length stupified his mind, and reduced him to the necessity of pleading even his clothes. In this predicament he sometimes, for several weeks, sat up in bed composing odes and elegies to the ‘Gentleman’s Magazine.’ All the mourning he could afford on the death of his wife was a pennworth of black ribbon, which he tied round the neck of his little dog. His wretchedness, like that of Savage, was commiserated by Dr. Johnson, who instituted for him, among his friends, a seconder. His name, however, did not more than his application, at length abandoned him, and, in May, 1749, he died in his garret in Shoe-lane, with his pen in his hand, as he sat in his blanket, translating the treatise of Fenelon on the existence of God. He left a second wife in extreme poverty, and was buried at the expense of the parish. (See an elaborate Biography in Gibber’s Lives of the Poets.)

BOZZARIS, MARCOS, a native of Souli in the moun- tains of Epirus, born about the end of the 18th century, was yet a boy at the time of the war of extermination waged by the Egyptians (1798-1801). [Ali Pacha.] At the close of that war in 1803 Bozzaris and his father were among the remnant of the Souliote popula- tion who succeeded in reaching Parga, whence they went over to the Ionian islands, then under the protection of the British fleet. In 1807, Bozzaris was knighted by the Sultan Ali, and appointed to command the Souliote forces; and when in 1809 the sultan and Ali, about 800 Souliotes, who were still in the Ionian islands, offered their services to the Ottoman admiral against their old enemy, and were accordingly landed on the coast of Epirus. Soon after however, having reason to complain of the inactivity of his sovereign and the neglect of the favourable proposals with a bribe of money from Ali, they went over to the pacha, by whom they were replaced in possession of their native mountains. This was a great stroke of Ali’s policy, which enabled him to carry on the war against the Turks for twenty years. The Souliotes now fought for him with their accustomed bravery under the command of Bozzaris, and their ranks were swelled by other Epirotes to about 3000 fighting men. With this force Bozzaris gained several advantages over the Turkish army, which was acting in Epirus against him. In the spring of 1821 the sultan sent Khourshid Pacha with a fresh army, who laid siege to Jannina. Bozzaris and his Souliotes annoyed the Turks by bold diversions in their rear, while the Greek revolution breaking out at the same time added to the difficulties of the garrison of Jannina and the death of Ali in Feb. 1822, the Souliotes continued the war on their own account, and being attacked by Khourshid in their mountains, they defeated him with great loss in May and June of that year. Khourshid at length retired and negotiated with Omer Said, who was master of the coast of Epirus, while at the same time Prince Maurocoradoto landed at Mesolonghi with a body of regular troops in the Greek service, and being joined by Bozzaris advanced towards Arta. This movement led to the battle of Peta, July 16, 1822, wherein Philip Bozzaris and the garrison of Gogos, an old Kleftis and captain of Armstoles, Bozzaris, after fighting bravely, was obliged to retire with Maurocordato to Mesolonghi. Soon after the Souliotes, who had remained in their mountains, signed a capitulation with the Turks, by which they gave up the garrisons of Missolonghi, Khiafa, and Gogos, paid the amount of a sum of money, retired with their families to Cefalonia, in Sept. 1822. Bozzaris with a hand- ful of Souliotes remained with Maurocordato, determined to defend Mesolonghi to the last. He kept the Turks at bay by various sorties, and also amused them by promises of surrender, until a Hydrocte Flotilla coming to relieve the
place, the Turks raised the siege and retired into Epirus, March, 1823. The pacha of Scodra advanced next with a numerous force of Albanians, determined upon taking Mesolonghi. Bozzaris feeling the importance of that town to the Greek cause, and knowing the weakness of the fortifications, sent an embassage to the Greek government to request his assistance to besiege and take Mesolonghi, and to be permitted to join the army. The government readily agreed, and Bozzaris arrived in the same character. On the 17th of May, 1823, he raised the siege of the town, having been attacked by the Turks under an exacting treaty. Having held a council with his officers, it was determined to attack the enemy's camp the following night. The Souliotes marched silently to the attack and surprised the Albanians, of whom they made a great slaughter. Bozzaris, being mortally wounded, died on the spot, and soon after another in the face, when he fell and expired. The Souliotes then withdrew, carrying away Bozzaris' body, which was interred at Mesolonghi with every honour. The executive government of Greece being informed of the event issued a decree in which they styled Bozzaris the Leonidas of modern Greece. His brother, Constantine Bozzaris, succeeded him in the command of the Souliote battalion. The self-devotion of Bozzaris was the means of protracting the defence of the town; the Greeks, despairing of its capture, dispirited by the loss they had sustained, the pacha of Scodra after some fruitless demonstrations against the town withdrew into Albania, and no fresh attack was made till 1825, when Mesolonghi was besieged and at last taken by the Egyptians under General Pasha of the Isthmus. The memorable battle of Kepenise is more remarkable is, that the Miridades, whom Bozzaris fought, were Christians like the Souliotes, though in the Ottoman service. They were said to have lost more than 800 of their men in the night of the attack. (Gordon's History of the Greek Revolution; Life of Ali Pasha &c.)

BRABANT, DUCHY OF, formerly one of the most important provs. of the Netherlands, was bounded on the N. by Holland and Guelderland, on the E. by Guelderland and Liége, on the E. by Hainaut and Namur, and on the W. by Belgium and Zealand.

Under the successors of Charlemagne, the dukes of Brabant were possessed of considerable power and influence over the rulers of the other Netherland provinces. Joan, eldest daughter of John III., the last duke of Brabant, bequeathed the dukedom to Anthony, second son of Philip the Bold, Duke of Burgundy; and by degrees, through intermarriages, inheritance and purchase, the various Netherland provs. which composed the Circle of Burgundy, came under the dominion of the house of Hapsburg. The death of Charles the Bold, the last of these dukes, whose daughter Mary was married to Maximilian, the son and successor of Frederick IV., Emperor of Germany, Brabant passed under the dominion of the house of Austria. In 1516 Charles V., Emperor of Germany, a grandson of Maximilian, became King of Spain, and his Netherland dominions were united with the crown of Spain.

The religious persecution instituted in the reign of Philip II. against all who would not profess the Roman Catholic religion, caused the inhabitants of the seven N. provs. to rise in defence of their liberties; and in 1581 these provs. were formed into an independent union, under the title of 'The United Provinces,' Prince William of Orange being declared Stadtholder. The seven provs. thus allied stood an ominous barrier against their rival, the house of Hapsburg. Guelderland, Holland, Zeeland, Utrecht, Friesland, Overysell, and Groningen. To these were afterwards added, by conquest and under treaties, Drenthe, and the 'Généralités,' so called on account of their belonging to the States-General of France. In these Généralités was included the existing prov. of N. Brabant.

The remaining Netherlands provs., including S. Brabant, continued united with the crown of Spain until 1795, when, after the battle of Ramilies, they acknowledged for their sovereign Charles V., Elector of Bavaria of Germany, and were thenceforward known as the Austrian Netherlands.

In the progress of these events the duchy of Brabant was not only divided in the manner described into separate provs., but it was also limited in extent by the erection of part of its territory into the prov. of Antwerp. In the course of the war which broke out in 1793, the whole were united to France. In 1806 the United Provinces were erected into a separate kingdom under Louis Bonaparte, who resigned his crown in 1810, when the territory was re-annexed to France.

At the Congress of Vienna, the whole of the seventeen provs. of the United Netherlands, including both N. and S. Brabant, were ceded to the King of Holland; but at the revolution of 1830 S. Brabant joined the revolt of the provs. which had formerly constituted the Austrian Netherlands, and it has since formed part of the kingdom of Belgium.

The two provs. of Brabant thus forming separate provs. and now belonging to different kingdoms, it becomes necessary to describe them under distinct heads.

BRABANT, NORTH, a prov. of the kingdom of Holland, bounded on the N. by S. Holland and Guelder- land, on the N.E. by Friesland, on the E. by the Belgian prov. of Limburg, and the Rhenish prov. of Prussia; on the S. by the Belgian provs. of Limburg and Antwerp; and on the W. by the Dutch prov. of Zealand. North Brabant lies between 51° 12' and 51° 56' N. lat., and 4° 12' and 6° 9' E. long.

This prov., which once formed part of the 'Généralités,' is generally level, but on the N. and W. there is some rising ground: it contains several marshes and extensive heaths. It is politically divided into three depts. (arrondis.), and nineteen districts (cantons).

The principal rvs. of North Brabant are the Maas, which forms its N. and E. boundary from 3 m. W. of Wansanum to its N. W. extremity; the Dommel, which has its source at Peer, in Limburg, enters North Brabant near the vil. of Eindhoven, and flows into N. past Eindhoven to Bois-le-Duc, after which, it, rejoining the Maas near Voorthuizen, flows into the Maas at Crevoucou. At Bois-le-Duc the Dommel is joined by the Aa, which rises in the prov. of Antwerp, about 4 m. N.E. from Turnhout, and enters North Brabant near the vil. of Hoogmeeden. The Mark or Merk has its source near Turnhout, and runs into the Maas from S. to N. enters North Brabant near to Meerle; it falls into Hollants-Diép opposite the isl. of Groeë, having passed through the town of Breda. This prov. is also washed on the W. by the channel which joins the E. and W. Schiedts, and which separates the Dutch from the Flemish from the continent; and on the N. by the arm of the sea called Hollants-Diép, and its continuation the Biesbosch.

The principal towns are Bois-le-Duc, Breda, Bergen-op-Zoom, Oosterhout, and Tilburg; the other towns of the prov. are Geertruydenburg, Willemstad, Feuden, Grave, Eindhoven, and Helmont.

Geertruydenburg, a small fortified town, is situated on the Biesbosch. This town was given up by treachery to the Dutch, in 1559, and was taken by Prince Maurice in 1593. It is situated on the Biesbosch, between 1550, 750 males and 800 females, together 1588 inh., a great part of whom are engaged in the fisheries. It has a good harbour, and is 7 m. N.N.E. from Breda.

Willemstad is situated on the Hollants-Diép, 13 m. S.W. from Dordrecht. Willemstad, which is fortified, was built in 1584, by William I., prince of Orange: it has a good harbour; and in 1830 contained 920 males and 947 females, together 1867 inh. It made a very gallant and successful defence in 1793, against the attack of the French under General Duplex.

Feuden, a fortified town near the Maas, is 15 m. N.E. from Breda. A great part of this town was destroyed in 1650, through the setting on fire by lightning of the castle, which contained 70,000 pounds weight of gunpowder. Pop. in 1830, 1010 males and 1010 females.

Grave or Graf, situated on the left bank of the Maas, is 16 m. N.E. from Bois-le-Duc. It is a fortified town, and is considered as the key of Guelderland, on the borders of which it stands. It was taken by the duke of Parma in 1566, and was restored to Prince Maurice in 1602. It made a stout resistance to the French army in 1794, and did not capitulate until a great part of the town had been destroyed. Pop. in 1830, 1458 males, 1375 females.

Eindhoven, situated on the riv. Dommel, was formerly the capital of the prov. of炫onville, which is a considerable trade, and various manufactures are carried on among them; they are cotton spinning, flax spinning and weaving, brewing and tanning. Its grain market is considerable. Pop. in 1830, 1490 males, and 1506 females.
manufacturers of woolens, cotton, and linen goods. The college of Helmond enjoys some reputation.

The pop. of Dutch Brabant amounted in January, 1830, to 318,691.

showing a progressive increase in the numbers of the people, accompanied by an improvement as regards the duration of life.

The area of the prov. being 1653 sq. m., gives a pop. of 211 to the sq. m., which is somewhat below the average density of 300, a fact which is attributable to its larger proportion of waste land.

North Brabant, in common with all the Dutch provs., and according to ancient usage, has its particular States Assembly, the members of which are elected by the nobles, the towns, and the royal municipalities. This assembly meets annually as a matter of course, and more frequently if con

voked by the King of Holland. Its functions are the regulation of local affairs, and the imposition of provincial taxes.

BRABANT, SOUTHERN, the metropolitan prov. of the kingdom of Brabant, is bounded on the north by Antwerp; on the E. by Liege and Limburg; on the S. by Hainaut and Namur; and on the W. by East Flanders. South Brabant lies between 50° 32' and 15° 3' N. lat., and between 3° 50' and 5° 10' E. long.

South Brabant is politically divided into three depts. (arrondissements): Brussel, containing 2 towns and 186 communes; Louvain, 4 110; Nivelles, 2 100.

The principal towns are, Brussel, Hal, Louvain, Aarschot, Diest, Tiersmont, Nivelles, and Ware.

Aarschot, or Aerschot, a small fortified town in the district of Louvain and prov. of S. Brabant, situated on the riv. Demer. This town was the capital of the barony of Aerschot in 1125; it was subsequently fortified by the Duke d'Aremberg, into whose possession it had passed. A part of the ancient fortifications, called Aurelian's Tower, still exists in a state of ruin.

Aarschot, which in 1829 contained a pop. of 3615, has a municipal government, consisting of a burgomaster, 2 sheriffs (chevëns), 9 councillors, a secretary, and a receiver. The town contains one commercial and two private schools, the former giving instruction to 35 and the latter to 230 children of both sexes. The principal branches of industry are those of brewing and distilling.

Aerschot is 4 m. W. from Montaignt, 15 m. N.E. from Brussel, and 2 m. S. from Antwerp.

The area of the province amounts to 328,426 hectares (312,419 acres), of which 216,883 are cultivated or productive 1,356 barren 1,768 occupied with buildings 8,419 roads and canals

328,426

The forest of Soignes, part of the remains of the great forest of Ardennes, is contained within the prov., and occupies 11,833 hectares (29,411 acres). This forest forms a sort of buffer between Brussel and Nivelles, commencing about 2 m. to the S. of Brussel, and extending beyond the vil. of Waterloo, a distance of 84 m.

The pop. of S. Brabant amounted on the 1st of Janu
ary, 1831, to 556,046 souls, on an area of about 1299 sq.

The number of births in 1853 was—

The number of marriages in the year was 3992. The proportion which these numbers bore to the whole pop. was 1 in 10 to 15 inhabitants.

Deaths 1 41 137

The average number of children born to every marriage is stated to be 4'8 throughout the prov.; the average number for the whole of Belgium before the war was 4'1. This is mainly due to the sex ratio.
low the surface. A range of these hills runs at a little distance to the S. of Brussels, and along their brow are the well-known woods, which cover 20,000 acres and skirt the field of Waterloo, forming a kind of barrier or part of a belt to the S. of the capital.

The best soils in South Brabant are towards Flanders and Hainault, which last may be considered as possessing the most fertile soils in the kingdom of Belgium. Judging from the rich appearance of the crops in the neighbours of Tournay and along part of the road from Thence to Brussels, it is a matter of no small advantage to Brabant, and to attribute to the goodness of the soil what is more properly due to industry and good husbandry. From attentive personal inspection we are inclined to believe, that the general cultivation of the whole district between Malines and Louvain in one direction, and Louvain and Namur in another, which includes the richest part of Belgium, does not, on the whole, exceed the average fertility of the inland counties of England, and is decidedly inferior to the rich alluvial soils of those counties, which are fatuated with refuse washes, and make an abundance of manure. The liquid part of the manure is collected in large tanks or reservoirs, and used either immediately on the land, or to accelerate the fermentation of the drier portions, by pouring it over and upon them as a compost.

The general system of husbandry in Brabant is very different from that in Flanders, and approaches much nearer to the most improved systems in England and Scotland. In some respects it is superior, in others not so; and both countries have practised for the most part the same agricultural improving practices, as far as is consistent with the difference of situation and climate, in which one country is more advanced than the other. The climate of Brabant is less variable and drier than that in the same parallel in Great Britain, there is less cold in winter, more intensity, and the snow lies longer on the ground. They are not so subject to late frosts in spring. In consequence of this their harvest is earlier. They have in general a fine dry weather after harvest, in which the land may be cleared of rock-weeds; and in this they spare no pains.

The crops in Brabant are not so varied as in Flanders. The larger extent of the farms does not allow so minute cultivation, nor so frequent a use of the spade; but from the moment the crop is severed from the ground, before it is out of the field, it is removed to stored houses, and laid away at worst, the hard ground is moved to the depth of only two or three inches by means of light sharp ploughs; it is repeatedly harrowed to encourage the germination of the seeds of annual weeds, and to destroy those that in the spring up; that root weed of which the Colchester turnip is a native, is carefully pulled and burnt, and the whole is cleaned, and all the advantages of a summer fallow are obtained. In autumn, after some showers, the soil is softened to the earth to a moderate depth, the land is ploughed again to a greater depth, and one or two smooths are measured for immediate sowing, or laid up in ridges to receive the beneficial influence of the winter's frost, and be ready for spring sowing.

In case it should not be sufficiently clean, according to the notions of the farmer, a crop of potatoes on light soils, or of parsnips on heavy, are planted to be cut and fed on the farm, the means of destroying weeds. Barley is mostly sown in autumn, and of the winter sort; but spring barley begins to be extensively cultivated, especially since the chevallier barley has been introduced from England, which is as hard and strong in the winter as the winter barley in common use before. Rye, both for bread and for distilling, is always a principal crop, and bears a higher price, in proportion to wheat, than it does in England. Clover is seldom sown with a spring crop, because they think, and perhaps truly, that the leguminous genus gets the whole plant so fast forward as to injure the crop sown with it. They prefer sowing clover amongst rye or wheat, which being allowed to a certain strength, is not so likely to be injured by the young clover; whilst it gives sufficient shade and shelter, and the winter barley in common use.

The cultivation of beans all over Belgium is the most imperfect: they are usually sown broadcast, mixed with tares or pease. The land is certainly kept clean by so close a crop, but, except it be cut up green for fodder, the produce is not very great; neither beans nor peas have room and air necessary for a perfect growth; and only come near to perfection. One of the greatest improvements in Belgian agriculture would be the drilling or dibbling of beans, and hoeing them by hand or hand hoes to prepare the land for wheat; at present they scarcely seem to know the value of the clover seed with which they both sown. In summer the clover seed is sown on roots when green food falls. As a consequence of a scarcity of dry fodder, the young and store cattle have little else but straw in winter, and sometimes get so low in condition as to suffer greatly in cold seasons, and be a long time in recovering flesh. This is a defect which the best agriculturists in Belgium acknowledge and endeavour to correct by their example, but prejudice and custom are everywhere opposed to, and retard rational improvement.

In rich deep soils hemp and flax are cultivated to a great extent, and the flax has been especially improved, and highly manured, and usually succeeded by wheat, which thrives well after them. Tobacco has been tried in a few places, and seems to flourish. Maise or Indian corn may be seen growing here and there, but not to any extent. In rich warm fields the corn ripens well, is very productive, but in most years the spring is too late for the plants, which cannot bear frost in its tender state. The variety which succeeds best is that called the quarrain. It is supposed in a warm climate to ripen early. The late corn, which is more intermediate, and the snow lies longer on the ground. It is not so subject to late frosts in spring. In consequence of this their harvest is earlier. They have in general a fine dry weather after harvest, in which the land may be cleared of rock-weeds; and in this they spare no pains.

The peach in Brabant is of a large and compact kind, more calculated for strength than for activity. The Belgians, more by nature than by choice, and by necessity, have been forced to feed their horses on turnips, and to feed them on turnips, instead of being able to feed them on grass, as they would like to do. The Belgians have not yet discovered, that a moderately sized animal may be more profitable than a larger; or that a small cow with slight bones, like the Alderney cow, the Jersey, the Durham, the Ayrshire, or the Brabant cow, may give as much and richer milk, on less food, than the large, clumsy type, which has been used up to this time. The government has taken pains to introduce improved breeds, and money has been expended for that purpose, but the prejudices of the peasants are not easily overcome; and though they have not yet inclined to take advantage of the good intentions of their rulers, they have not availed themselves of the opportunity to purchase cows and bulls of a finer breed imported from England, and will probably be the means of opening the eyes of others,
when it is observed that the finer breed is more profitable than the old.

The horses are large and strong, and on the whole fully equal to the general run of farm horses in England. They might be much improved by a cross with the more active Yugoslavian and also with the Norfolk breed. The Piemontese horses have a great defect in the form of their hips and in the croup, which falls suddenly towards the tail, which is called in England being goose-rumped.

The sheep are of a very inferior kind, long in the leg, with coarse wool and hanging ears. A few good Leicester and improved Cotswold sheep have been introduced and will probably improve the native breed. The fleece of a very fine wool imported from England being sorted and combed was exhibited in 1835 at Brussels at the annual exhibition of the industrious producers of the country, and excited universal admiration for the length and fineness of the staple, and especially for the quantity of the wool. The whole fleece when shorn weighed twenty pounds, and from this nine pounds of fine long dressed wool was obtained.

The Belgian pigs are similar to the French, and nearer to the shape of greyhounds than of pigs, with long sharp snouts, and very long legs, the whole body being in the form of an arch of a circle, and very thin. A better breed has however been introduced, and, from the naturally prolific nature of the animal, will soon spread and supplant the old breed. There is a general spirit of agricultural improvement amongst landed proprietors in the country which the government is anxious to encourage.

The implements of husbandry used in Brabant are few and rude. 'The Dutch have obtained a very fine-Flemish swing plough, which they call a foot plough, as it is also called in some parts of England, in contradistinction to a wheel plough. At the same time they also retain the old and heavy turn-wrest plough, with a shifting coulter and many other defects, as may be still seen in some parts, and hence, yet they allow that the light Flemish plough does the work as well in the stiffest soils, and requires less force. It is surprising that two instruments so very opposed to each other in principle should be used on the same farm and in the same field, but in the field. At last year's agricultural show at Thow, the ploughman tried both kinds of plough, and digged them in a common field, and at last year's agricultural show at Thow, the ploughman tried both kinds of plough, and digged them in a common field, and thus proved without dispute which was the best, the first plough requiring more horses and the second less. The reason is that the Flemish plough is of later introduction, and the prejudices against anything new are not yet totally overcome.

The plough is universally drawn by horses two abreast, driven in reins. Very few ox teams are seen. The land, in general, is not so neatly tilled as in Flanders, Scotland, and the best agricultural counties in England. There is not the same attention to the straightness and equality of the furrows in ploughing. The harrows are triangular, with wooden tines set at an angle, and which may scratch the surface but cannot penetrate to any depth. A heavy iron drag to tear up the clods, and bring deeply-laying roots to the surface is much wanted, but is not in use anywhere, as far as we could observe. Only a few tractors are seen in the province. A stone roller is used, set in a triangular frame, which drags on the planks and serves to break the clods, and is a simple useful instrument, of which we annex a figure. The triangle A B C

draws on the ground before the roller, and the horse draws by the hook B.

A winnowing machine with a fly and sever is the only additional instrument in general use.

BRACCIANO, LAGO DI, a lake in the Roman state, the antient Sabatius, about 17 m. N.W. of Rome. It is of a circular form, about 11 m. in circumference, and lies at the foot of Mount Cimino. It is about 120 acres in extent, and is surrounded by hills, except to the S., where it borders on the wide unwholesome plain which slopes down to the sea. To the E. the lake has an outlet in the riv. Arno, which flows into the sea at Macerace. On its S.W. bank the castle of Bracciano rises with its old embattled walls and towers, on a rock projecting into the lake, with the vil. built at the foot of the castle, and containing about 1500 inh., with several iron-works and a paper manufactury. Brac-
Leonardo wrote to him against giving way to his feel-

mgs. Poggio was still, nominally at least, papal secretary at the time. After Martin V. was solemnly acknowledged as legate at Pisa, he was the council dissolved in 1454, Poggio followed the pontiff on his return to Italy, as far as Mantua, where he suddenly left the papal retinue and repaired to England. Whether he left in disgust, or through fear for having expressed his sentiments too freely on church matters, is uncertain. In 1454 Poggio obtained a new benefice; he had received an invitation from Cardinal Beaufort, Bishop of Winchester. His expectations however from Beaufort's liberality were disappointed; and at length, having received through some friends in Italy an offer to resume his office as he, he left England about the beginning of his last year, during his residence in England there are scattered fragments in his published letters, and still more in the un-
edited ones. His picture of the manners and habits of the English is not flattering. He says that they were more addicted to every sort of luxury than those of any learning; and that the few who cultivated literature were more expert in sophisms and convivials quibbles than in real science.

Poggio continued in his office during Martin's pontificate, and at the same time he looks after MSS. and antiquities, for which latter object he made excavations at Ostia, and other parts of the Campagna. He also made Latin translations of the first six books of Diodorus Siculus, and of Xenophon's Cyropedia. Eugenius IV. having, in 1447, raised the Inquisition in Italy, Poggio took part in the popular rebellion to remove his court to Florence, then came the controversies between the Pope and the Council of Basal, which lasted during the rest of Eugenius's pontifi-
cate, till his death in 1447. The greater part of this work was improved and corrected by his son-in-law, who had purchased in the Val d' Arno, some say with the produce of some classical MSS. which he sold. He gives in his letters a description of this residence, which he had adorned with statues and other remains of antiquity, that he had collected in various places. He wrote there several works, among others 'Discourse on the Unhappiness of Princes,' which he dedicated to Thomas of Sarzana, afterwards Pope Nicholas V., and his virulent invectives against Felixio, who had been charged with lying in his excursions and of publishing false 

information; these invectives the most horrid charges are brought against Filefo, which however must not be taken literally, for it was the practice of Italian scholars in that as well as in the following ages, to abuse one another without any very strict regard to the truth. When the two fierce disputants became reconciled, Poggio wrote a sort of disavowal of his former accusations, which is found at the end of the invectives. In 1453 Poggio married Selvaggia, of the family of Buondelmonte, of Florence, a young and handsome lady, with whom he was already acquainted by correspondence. When to his marriage, he wrote a dialogue on the question—An esti sit uxor ducenda? From that time Poggio reformed his life, which had been before rather licentious. In 1447 he published a selection of his letters, written in Latin, like all his other works, in two volumes. When to the second volume of the Venetian, Biennio Conti, in the east also wrote Dialogus adversus Hypocrinam, in which, as well as in his disquisition, De Avaritia et Luxuria, he inveighs against the vices of the clergy, and especially of the monks, which were certainly very flagrant in that age, and were the main cause that led to the great reformation in the following century. Notwithstanding his satirical freedom he preserved the good graces of Nicholas, in support of whose right to the papacy he wrote a bitter invective against his rival the antipope Felix, in which, as usual of such attacks, he did not spare a hundred names of his adversaries, from Philip the Bold, Duke of Burgundy, to Florentine and Venetian clerics and laymen. He wrote Dialogus de laudibus et vitiis, which is a satire against the threepiece suit; a short time after he had written a poem against the new religion of the Greeks and Latins; in which he ridiculed the ceremony of the Eucharist, and the Greek theory of the elements, and denounces the absurdity of the Scholastics' arguments. Poggio also composed a treatise De Lingua Latina, and a satire against the learning and the dandies of his time. His greatest work was a brief history of the Medici, and he was the first who wrote the life of Machiavelli. In 1455, on the death of Carlo Aretonio, chancellor of the Pope, Poggio, through the influence of the Medici, was appointed his successor. He finally quit the Roman court after having been fifty years in its serv-

ice; and it was not without regret that he parted from his kind patron Pope Nicholas.

Poggio having left Florence, and having the archives of Florence, he under-
took a history of that republic, Historia Florentina, lib. viii., which embraces the period from 1350 to 1455. It was translated into Italian by his son Jacopo, and printed in 1476, and afterwards republished in a more correct and improved version by his other son-in-law. A second edition of this text was not published till 1715, by Recanati, who prefixed to it a biography of the author. Poggio has been charged with marked partiality for his countrymen in his history. Another author is not so particular in his characterisation of Machiavelli, who, in the preface to his own history, observes that both Poggio and Leonardo Bruni, two excellent historians, had diligently described the wars between Florence and the other states and princes, but with regard to the civil con-

sequences of a war, of which Florence was the chief victim, he thinks they had been either silent or extremely laconic in their account, either because they fancied them beneath the dignity of history, or perhaps because they were afraid of offending the relatives and descendants of persons who had suffered in the later achievements of the city. Poggio died at Florence in 1459, and was buried with great honours in the church of Santa Croce, near his friend Leonardo Bruni. A statue of him by the sculptor Dona-
tello is in the duomo or cathedral.

Poggio never lost his respect for the distinguished scholars of the epoch of the revival of literature, and one of those who contributed most to the spreading of that revival. His long life, the offices of trust which he filled, his travels, his ex-
tensive correspondence, his multifarious learning, all con-
spired to make him one of the most remarkable writers of the fifteenth century. His works, especially his Orations and his Epistles, are remarkable for their eloquence and fluency of style, though their language does not equal in classic purity that of Poliziano and some other latinitists of the following age. His Orations are written with a brilliancy and frankness; even in his addresses to the great, his language, though courteous, is free from flattery. He had an ample share of Florentine causticity of humour, and his invectives are virulent and outrageous beyond the limits of all decency and justice; this was however the fault of the generality of his contemporaries. But he could also be a staunch friend as well as a violent enemy. Even as a monitor he could divest himself of all unbecoming asperity, as he proved by his reproof to Beccatelli, on the occasion of one of his letters. At a certain time there was a pamphlet called the 'Heraphrodite, which was burnt in various towns of Italy by the public executioner. While Valla and others, which they were to be treated with as an enemy. This is the case of his book, Poggio wrote to the Panoramica, expressing his opinion of the Venetian. It is at second sight a clear example of one of capable of better things, reminding him that he was a Christian living among Christians, and not among the worshippers of the heathen gods, and exhorting him to apply himself in future to graver and more be-
coming studies.
The works of Poggio have never been properly collected. The Bassil edition, 'Poggio Opera,' 1538, wants many of them, and is also typographically incorrect. The dialogue 'De Varietate Fortunae' was published by Poggio at Lyons in 1679, had appeared before in a collection called 'Fasciculus rerum expetendarum et fugiendarum,' Cologne, 1553. The treatise 'De Varietate Fortunae' was printed first at Paris, in 1523, with fifty-seve indelible letters. But most of his other letters were first printed in a collection of different libraries. A great number of them exist in the Riccardiana at Florence, which contain many curious particulars of his life and times. The Advocate Tenilli has made good use of them for his Italian translation of Shepherd’s 'Life of Poggio.' Florence, 1829. Poggio’s funeral oration for Cardinal Zabarella, which he delivered before the council of Constance, in 1417, has been published separately. 'Oratio in funere Francisci Zabarelli, habita in Concello Constantiensi, anno 1417,' Padua, 1555. But most of his other orations remain unprinted and are preserved in MSS. in the Greek, Lucian’s 'Dialogue on the Ass,' which is printed in the Bassil edition of his works. The miscellany called 'Poggiana,' by Lenin, 1720, which professes to give an abstract of his life, opinions, &c., is full of errors. Poggio’s 'Fasti' was not intended for publication. Poggio’s son Jacopo was a man of learning, but after being in his youth the friend of the Medici, he conspired with the Pazzi against Lorenzo, and being seized after the murder of Giuliano, was publicly hanged in 1478.

BRACHELYTRA (Entomology), according to Mr. Stephens’s arrangement of insects, forms the sixth division of the order Coleoptera. M. Latreille, however, places this tribe of insects as the second family of the Pentameera, with the name of Brachytridae. The genus Brachytria (as it is now translated from the Greek called Staphylus) may be distinguished by the elongate form of the body and the shortness of the wings, which in most instances scarcely cover one-third of the length of the abdomen; their maxillae are furnished with one palpus. The apex of the abdomen is provided with two vesicles, which can be protruded at the will of the animal.

The habits of the Brachytria are very various, but the greatest number of them are perfectly herbivorous, and feed on vegetable substances, upon which they feed; some are carnivorous. The shortness of the wing-cases probably allows of a greater flexibility in the body.

BRACHCHINUS, a genus of coleopterous insects belonging to the Carabidae, are very common in the gardens, and furnished with a small tooth-like process in the middle. The Brachini possess a remarkable power of violently expelling from the anus a pungent acrid fluid, which, if the species be large, has the power of producing a discolouration of the part of the body on which it is caused to be expulsed, and it is said to be the fluid that is emitted by certain species of ants. This is a very dangerous and unpleasant process, considering the size of the insect, accompanies the expulsion of this fluid, which, being discharged, instantly evaporates.

About five species of the genus Brachinus have been found in this country, of which B. creptans is the most common; it is found under stones, and occurs plentifully in chalky districts. This species is rather less than half an inch long; the head, thorax, and legs are of a yellowish red colour; the wing-cases are greenish, or black. The antennae are reddish, with the third and fourth joints black. Many of the species of Brachinus resemble the above in colour. The species of the genus Apinus (a genus very closely allied and differing chiefly in being apterous) are generally yellowish blue, having four black spots on the elytra; the thorax is black, and the legs are more or less suffused with black; they are likewise of a larger size for the most part, and abound more particularly in warm climates.

BRACHYONUS (Muller), Zoology; a genus of minute animals, found both in stagnant fresh water and in sea water. Their organization has produced some doubt among naturalists as to their proper place in the scale of creation. Lamarrack arranged them under his Rotifera (wheel-bearing animals) being the second section of his Ciliated Polypes, and having one or two ciliated and rotatory organs at the orifice of the mouth. Cuvier placed them in the first order (Rotifer) of his Infusoria, which forms his fifth and last class of the Zoophytes—in short, the class at the extreme end of the animal kingdom. De Blainville also brings them under the Rotifera, which form the first section of his Microraia heteropoda. The following is De Blainville’s definition of the genus:

Body more or less covered by a shell (or sheath), formed of one or two pieces, and more or less prolonged posteriorly by a caudiform abdomen, two tufts of vibratory cilia at the anterior extremity.

Savigny, Schwigger, Schrank, Bory de St. Vincent, Carus, have all contributed to throw light upon these microscopic creatures. De Blainville thus writes in his Actinologie (1834):

'The impossibility under which we find ourselves of characterizing, by the particular disposition of their appendages, the genera, more or less numerous, which may be formed among the Microraia, we propose to extend to all the species, whose bodies are covered by a sort of shell of one or two pieces for a more or less considerable part of their extent, the denomination of Brachion, devised by Hille and adopted by Pallas and Lamarck. We have already observed many species of this genus belonging to the different sections of the Microraia. Brachion is very common in all stagnant fresh waters; it is very probable the Rotifera of Hill, Essay 13, p. 288, concerning which that author gives very interesting details that show it to be a true entomomastous animal. [Entomastraca.]

'The Corona of Corti belongs also, without doubt, to this section. We have also studied the Trichoda piazzia of Muller, which is certainly a Brachion. We cannot conceive how Muller could say that it creeps after the manner of the Pisania, Creataceum. It is the extremity of its tail, and it travels as if it were provided with a great number of appendages under its shell.

'Brachionus ovalis has also been often presented to our observations. It has certainly two tufts of vibratory cilia before, and behind a pair of sufficiently long appendages, by the aid of which it is also able to fix itself. Its shell appeared to us to be bivalve; but of this we are not certain.

'Brachionus patella have we seen once, and observed sufficiently long appendages, by the aid of which it is also able to fix itself. Its shell appeared to us to be bivalve; but of this we are not certain.

'Brachionus pinnatus we have seen once, and observed sufficiently long appendages, by the aid of which it is also able to fix itself. Its shell appeared to us to be bivalve; but of this we are not certain.

'Brachionus pinnatus we have seen once, and observed sufficiently long appendages, by the aid of which it is also able to fix itself. Its shell appeared to us to be bivalve; but of this we are not certain.'
De Blainville divides the genus into the following sections:

Species whose univalve shell is oval, much shorter than the body, prolonged posteriorly into a very long caudiform abdomen, which is provided at its termination with a pair of very short appendages.

Example. Brachionus veneris. (Müller.)

Species whose oval, elongated bivalve shell almost entirely covers the body, and is terminated by a short caudiform abdomen, provided with a pair of appendages which are, in general, of some length.

Genus Mytilina of Bory de St. Vincent.
Example. Brachionus ovatus. (Müller.)

Species whose body is entirely covered by an oval shield, which is nearly round, univalve, and terminated by a caudiform abdomen, without terminal appendages.

Genus Prooboscida of Bory de St. Vincent.
Example. Brachionus patina. (Müller.)

Species whose body, entirely covered by a nearly circular shell, is terminated behind by a pair of very long and setaceous appendages.

Genus Squamilla of Bory de St. Vincent.
Example. Brachionus bractea. (Müller.)

BRACHIOPODA, or BRACHIOPODOUS MOLLUSCA (Zoology). Cuvier's fifth class of Mollusks, the Paliobranchiata (Paliobranchiata) of De Blainville, being the second order of the latter's third class of Mollusks (Deepshelphora).

This class, though comparatively low in the scale of creation, is interesting to the physiologist, and of considerable value to the geologist, who finds in the fossil forms so small portion of those natural marvels which indicate the history and the stratification of our globe. We have, therefore, entered more largely into the natural history of the Brachiopoda than their consequences as organized beings would otherwise warrant in a work of this description.

The family of Lingula antarctica, in the Annales du Musée, first made known that organization, by which the mantle, in addition to its office of secreting the shell, defends the valves, has been submerged to the circulating system. Instead of the branchie of the ordinary bivalve, where the gills are arranged in the usual manner, in the Lingula the gills are united together in two fringed and splayed discs, and that the branchie presented themselves on the internal surface of both lobes of the mantle in oblique parallel lines. He further found that these lobes were traversed by vessels of connection, which he named the branchial veins, which are connected together in two symmetrical systemic hearts. Here was a new type of circulation, and to the mollusks which presented these interesting and important modifications he gave the name at the head of our article, significant of the fringed arms which in this class took the place of the foot or organ of progression in the cockle, &c.

Lamarck and Walsh had previously taken the analogous parts of Terebratula for branchie, and Pallas, who is not quoted by Cuvier, describes the arms of Terebratula with minute accuracy and beauty, but considers them as branchie, and compares them to those of a fish.

De Blainville, in the 'Dictionnaire des Sciences Naturelles,' gives an account of the organization of Terebratula. But both Cuvier and Blainville were led into error in their attempts to trace out some parts of the organization of Terebratula; and it was reserved for Mr. Owen, in his accurate, interesting paper, 'On the Anatomy of Terebratula,' and the especially, the Genera Terebratula and Orbicula,' published in the Transactions of the Zoological Society of London,* and derived from the dissection of specimens brought by Dr. Meek and Captain James Ross, R.N., fully to investigate the subject as to leave little or nothing to be desired upon the subject of the anatomy of Lingula and of the two genera last named. Our limits will not permit us to follow the learned author through his memoir, the whole of which, together with the beautiful illustrations that accompany it, is worthy of the most attentive perusal by

----

ticy. With respect, however, to the respiratory organs, the modifications which these have presented in Orbicula and Terebratula show the Brachiopods to be still more inferior in the structure of the branchiae in Lingula; and notwithstanding the division of the systemic heart, I consider that there is also an inferiority in the vascular system. Each heart, for example, in the Brachiopoda is as simple as in Ascidia, composed of a single arch, and not composed of a distinct auricle and ventricle, as in the ordinary bivalves; for in these, even when, as in the genus Arca, the ventricles are double, the auricles are also distinctly two in number; and in the other genera, where the ventricle is single, it is mostly supplied by a double auricle.

The two hearts of the Brachiopoda, which in structure resemble the two auricles in the above bivalves, form therefore a complexity or superiority of organization more apparent than rare. Having been thus led to consider the circulating as well as respiratory systems as constructed on an inferior plan to that which pervades the same important systems in the Lamellibranchiate bivalves, I infer that the position of the Brachiopoda in the natural system is inferior to that of Ascidia.

Among the relations of the Brachiopoda to the Tunicated Ascidia, and more especially to the Ascidia, we may first notice an almost similar position of the extended respiratory membranes in relation to the mouth, so that the currents containing the nutrient molecules must first traverse the ventricles and auricles of the heart before reaching the mouth; the simple condition, also, to which the branchiae are reduced in Orbicula and Terebratula indicates their close affinity to the Ascidia. But in consequence of the form of the respiratory membranes in the Brachiopoda, whose substance is that of the thick outer boundary of the Ascidia, the digestive system derives no assistance from that part as a receptacle for the food, and the superaddition of prehensile organs about the mouth became a necessary consequence. The Brachiopoda again are stationary, like the Ascidia, and resemble the latter in the pedunculated mode of their attachment to foreign bodies.

With the Cirripedia their relation is one of very remote analogy; their generative, nervous, and respiratory organs being constructed on a different type, and their brachiocardiac system of that of their Ascidian brethren. In the essential points the Brachiopoda closely correspond with the Acephalous Mollusca, and we consider them as being intermediate to the Lamellibranchiate and Tunicate orders; not however in the same degree, so far as they are at present known, distinctive characters of the former group, not being regarded as a distinct class of Mollusks, but forming a separate group of equal value with the Lamellibranchiate.

The following is De Blainville's arrangement, slightly modified:

* Shell Symmetrical.

Genus Terebratula (Bruguères).

Animal depressed, circular or oval, more or less elongated. Shell delicate, equilateral, subterminal, inquivalve, one of the valves larger and more rounded (bombe) than the other, prolonged backwards into a sort of heel, which is sometimes recurved into a kind of hook-like process and pierced at its extremity by a round hole, but more frequently divided into a fissure more or less large and of variable form. The opposite valve generally smaller, flatter, and sometimes oculiforous. Of a complicated loop or internal support to which the arms are attached we shall presently speak at large.

Hinges on the border, condylid, placed on a straight line, and formed by the two oblique articulating surfaces of the one valve placed between the corresponding projections of the other. A sort of ligament comes forth from the hole or fissure above described, by which the animal fixes itself to submarine bodies.

The following is Mr. Owen's description of the peculiar, complex, and extremely delicate testaceous apparatus, sometimes called 'the arm', and sometimes by Mr. Proctor, attached to the internal surface of the imperforate valve:

The principal part of this internal skeleton, as it may be termed, consists of a slender, flattened, calccreous loop, the extremities of which are attached to the lateral elevated ridges of the hinge; the crus of the loop diverge, but again approximate to each other as they advance for a greater or less distance towards the opposite margin of the valve; the loop then suddenly turns towards the perforate valve, and is bent back upon itself for a greater or less extent in different species. With the loop very subobsolete, in the Terebratula, Brug., there is but a small tendency towards a reflected portion; but where the loop is of great length and width, as in Ter. Chilensis, Brod., Ter. dorata, Lam., and Ter. Sonorensis, King, the reflected portion is considerable. The loop, being supported by its origins or crura, is commonly attached to two processes going off at right angles from the sides, or formed by a bifurcation of the extremity, of a central process, which is continued forwards to a greater or less extent from the hinge; but it is sometimes entirely free, except at its origins, e.g., in Ter. vitrea. This reflected loop, forming two arches on either side the mesial plane, towards which their concavities are directed, I have figured as it exists in Ter. Chilensis and Ter. Sonorensis. It is represented of a similarly perfect form in Ter. dentata, by M. de Blainville in his 'Animal coloris'; and the same apparatus in Ter. dorata is very well figured by Cenmmis; by Sowerby, and more recently by G. Fischer de Waldheim. A similar form is also figured in another species of Terebratula by Poli.

The arms of the loop are so slender, that, notwithstanding their calcarious nature, they possess a slight degree of elasticity and yield a little to pressure; but, for the same reason, they readily break if the experiment be not made with due caution. The interspace between the two folds of the calcarous loop is filled up by a highly fringed membrane, which binds them together, and forms a protecting wall to the viscera: the space between the bifurcated process in Ter. Chilensis is also similarly occupied by a strong aponeurosis. In this species the muscular stem of each arm is attached to the outer sides of the loop and the intervening membrane. They commence at the pointed processes at the origins of the loop, advance along the lower portion, turn round upon the upper one, and are continued along it till they reach the transverse connecting bar, where they advance again forwards and terminate by making a half spiral twist in front of the mouth. It is these free extremities which form the third arm mentioned by Cuvier. These arms are ciliated on their outer side for their entire length, but are cilia longer and much finer than the brachial fringes of Lingula; and except at the extreme ends, which have a slight incrustation, they are uniformly straight. There is thus an important difference between Lingula and those species of Terebratula which resemble Ter. Chilensis in the powers of motion with which the arms are endowed; since from their attachment to the calcarous loop they are fixed, and cannot be unfolded onwards as in Lingula. Owing to this mode of connexion, and their ciliated structure, their true nature was much more liable to be misconceived by the early naturalists than is now perceived not to have escaped the discrimination of Linneus, who, as Cuvier has observed, founded his character of the animal of Anomia on the organization of one of the Terebratula which he included in that genus.

The recent species are numerous and widely diffused, and the genus appears to be capable of flourishing in extremely warm and extremely cold regions, as well as in more temperate climates. Thus some of the species have been found in the Indian seas and at Java (Ter. ravescens, Lam., for example), and Ter. peticularis, brought home from the late expedition by Captain James Ross, R.N., was fished up from a depth of twenty-two fathoms near Felix Harbour, in lat. 70° N. E. side of Boothia. The average depth at which Terebratula has been found ranges from ten to forty fathoms. De Blainville has thus subdivided the species:

A. Summit of the larger valve pierced with a round hole, well defined.
1. Valves triangular, with a straight anterior border. Example, Terebratula digona (fossil).

3. Valves raised as it were, or hollowed on the mesial line. Examples. *Terebratula sanguinea* and *Terebratula dorsata* (recent).

4. Bilobated, the valves striated from the summit to the circumference, and deformed as it were at the junction of their border. Example. *Terebratula deformis* (fossil).

5. Trilobated, as it were, by the projection of the mesial part. Example. *Terebratula alata* (fossil).

B. The heel of the larger valve deeply notched up to the border of articulation; notch or fissure rounded. 1. Valves rounded at their anterior border. Example. *Terebratula rubra* (recent).

2. Valves sub-bilobated by the depression or expansion, which is apparent at the anterior border. Example. *Terebratula Copul Spermatias* (recent).

D. Opening of the heel, marginal, triangular, but much larger transversely than longitudinally. Line of articulation quite straight.

1. The small valve provided with a straight flattened support, bifurcated at its free extremity; a projection (*cloision*) in the other valve penetrating into this bifurcation. (Genus *Pentasteria*, Sowerby.—Fossil.) Example. *Strygocephalus Burtini*.

2. The lateral parts of the support formed of a very fine spiral filament, so as to produce two hollow somewhat conical masses which nearly fill the whole of the shell. (Genus *Spirifer*, Sowerby.) Example. *Spirifer trigonalis* (fossil).
The recent species have been found at depths ranging from the surface to seventeen fathoms; and specimens have been taken in hard coarse sand from four to six inches below the surface of the sand.

*Lingula* has been found in a fossil state in the inferior oolite of Yorkshire, in the old red sandstone formation, and in other old fossiliferous beds.

Genus *Thecidium*, Defrance, Thecidium, Sowerby. De Blainville thus describes the genus.

Animal entirely unknown, but very probably differing but little from that of *Orbicula*.

Shell equilaterial, regular, very inequivalve, and sufficiently similar to the *Terebratula* of the latter sections; one valve hollowed, the heel or hook recurved, entire, without a fissure and adhering; the other flat, operculiform, and without any trace of the internal support.

Hinge longitudinal; articulation by two distant condyles, as in the *Terebratula*, with a large mesial tooth in the flat valve fitting between the conoid teeth of the concave valve.

Example. *Thecidium radiatum*.

The recent species above mentioned is an inhabitant of the Mediterranean, and found among the common red coral of the Tuscan Seas.

The fossil species are tolerably numerous, and Sowerby says that those which he had seen appeared to belong to the chalk, and were brought from Maastricht, and from Orkney in Normandy.

Genus *Strophomena*, Rafinesque; (Fossil).

Shell regular, equilaterial, subequivalvate; one valve flat, the other slightly excavated; articulation straight, transverse, with a small projection notched or dentellated transversely. No trace of an internal support.

Example. *Strophomena rugosa*.

As Strophomena has no living representatives, at least none yet discovered, there can be no description of the animal, which is however, judging from the construction of the shell, most probably brachiopodous.

The fossil genera *Plagiostoma, Dianachora*, and *Podopes* (see these titles) are placed by De Blainville under this section. We do not however think that there is such pregnant evidence of a true and entire brachiopodous organization, as to warrant this decided position under the Brachiopoda. Indeed De Blainville himself says that some of the *Plagiostomatia* are of the family *Terebratula*, and that the others (he instances *Plagiostoma Mantellii*) are entirely different, and he allows that these last ought to form a distinct genus of the family of Subostracians. Defrance places *Podopes* among the oysters.

*••*

Shell unsymmetrical, irregular, always adherent.

Genus *Orbicula*, Lamarck.

Shell orbicular, very much compressed; inequilateral, very inequivalve; the lower valve very delicate, adhering; the upper valve patealiform, with the summit more or less inclined towards the posterior side. Fissure of adhesion in the lower valve subcentral. Hinge toothless.

Example. *Orbicula lamellata*.

---

No. 311.

**THE PENNY CYCLOPEDIA.**

**Vol. V.—2 S**
tooth. *Rictus* smooth. Feet small; lateral toes unequal; the hinder toe rather shorter than the tarsus.

11. *Tarsus, Horsfield*. Bill nearly entire; bill is the head; lengthen concical. *Rictus* somewhat lengthened; the anterior scales divided. Tail even. Type *Tarsus acaparula*, Horsfield.

Mr. Swainson does not seem to have been aware that the appellation *Brachypus* had previously been conferred by Fitzinger on a sub-genus of Sauriæ, belonging to the *Turdidae*. The name, however, he adopted, and it should, therefore, be no longer used to distinguish a sub-genus of birds. The term was, however, the head of this article, which Mr. Swainson has applied to the sub-family, might be changed with advantage; for it may be liable to create confusion when unexplained by context, and leave the reader in doubt whether a sub-family of birds or reptiles is intended.

For Mr. Swainson's further account of *Brachypodium*, see Fauna Boreali-Americana, vol. ii., where the characters of the subgenera given above will be found.

BRACHYPHYX (Zoology). A genus of birds approaching to Saxicola, thus defined by Dr. Horsfield:—

Essential character. Bill with the culmen carinated between the nostrils, the sides being flattened, and rounded towards the apex with the sides convex; edges subincisivated.

Wings very short and obtuse. Quills entire, the first subspurious, from the second to the fifth gradually increasing, from the fifth to the tenth longer and nearly equal, the rest gradually shortening. Tail moderate, rounded; the feathers two.

Wings very short and obtuse. Quills entire, the first subspurious, from the second to the fifth gradually increasing, from the fifth to the tenth longer and nearly equal, the rest gradually shortening. Tail moderate, rounded; the feathers two.

Feet elongated and weak. Tarsi slender, twice as long as the middle toe. Toes compressed, very slender, the middle longest, the lateral toes nearly equal, the outer toe sub-coalescing with the middle toe at the base. Claws very much compressed and very short. Type *Brachyphteryx montana*, Horsfield. The species on which the genus is founded is thus described by the author:

Weight of the male five, and of the female six, drachmas. In the length of the two sexes scarcely any difference is perceptible. The measure is nine inches and nine lines from the tip of the bill to the end of the tail; to the extremity of the claws the length is six inches. In the male, the head, neck, and breast have a dark indigo blue tint, inclining to black, with a greyish reflection on the surface, variegated with lighter and darker shades; on the throat and the lower part of the neck this colour passes into grey; on the forehead it is more intense, inclining to black. Above the eyes is an oblong white spot. The back, the wings above the shoulders, the coverts of the tail, the vent, hypochondriac and thighs and the under parts, are dark brown, with a ferruginous reflection. The wings underneath, stern and tail, are dark brown, and underneath, are pure blackish brown; the shafts of the quill and tail feathers are black and shining. The inner vanes of the quills and the tail feathers generally have a dark deep brown. The end vanes of the tail feathers are slightly tinted with the ferruginous lustre of the upper parts. The lower parts of the breast and abdomen are whitish. The plumes on the posterior portion of the body are very thickly disposed; the vanes consist of long, delicate, silky, pellucid laminae or lamellae, forming a
Brachyteles (short-winged birds). Cuvier's name for those birds generally known by the name of 'Diver.' [Diver.]

Brachypterus [Brachypodine and Chalcides.]

Brachyteles (Zoology), a genus of quadruped, separated from the rest of the family by some of the more important (among other differences) of the very small development of the thumb.

[Atelids, species 7, 8.]

Brackley, a bor. and m. t. in the bund. of King's Sutton, Northamptonshire, 56 m. N.W. from London, and 1 m. S.W. from Northampton. Brackley is said to derive its name from the broake with which the district was once overspread. Although it has long been a poor place, it seems to have been in a very flourishing condition both before and after the Conquest, being particularly eminent for its share in the wool traffic. An act existed as a corporation in the time of Henry III., although the place was not governed by a mayor until the 7th of Edward III., at which time it was required to send up three merchant staplers to a council concerning trade held at Westminster. It never again sent representatives until the last parliament of Henry VIII., after which it continued to send two members till it was disfranchised by the Reform Bill. The market is first distinctly noticed in 1217, it is now held on Wednesday; and there are nominally five fairs, of which only that on St. Andrew's day is any importance. The pop. of the bor. amounted in 1831, to 2107 persons, of whom 1094 were females. The town, which is chiefly built with unhewn stone, extends up a gentle ascent on the N. bank of the Ouse, which is here a small stream, crossed by a bridge of two arches.

Brackley is inclosed into a parsonage, but otherwise distinct. The par. church is dedicated to St. Peter. When erected is not known; but the vie. was endowed in 1223. The living is in the deaconry of Peterborough, and is worth £59. per annum. The other church, dedicated to St. James the Great, was rebuilt and a new ch. erected in 1257: it is considered old even in Leland's time. The living is a curacy, not in charge, subject to the vicar. There was an hospital here, founded somewhere between 1146 and 1167, by Robert Boss, Earl of Leicester. The estates with which it was endowed were afterwards added to the college, Oxford, on condition of maintaining a priest there to say mass for the soul of Lord Francis Lovel; a duty which at the Reformation was exchanged for that of supporting a free school. This school still exists. It is held in a plain building erected in 1587; the master receives 15l. per annum from Magdalen College, and 12l. per annum has been left to be distributed in prizes among the free scholars. The chapel of the old hospital had fallen into decay, and was thoroughly repaired about the middle of the last century, by Mr. John Welcher, who also provided a stipend to enable divine service to be performed therein every alternate Sunday. The son of the same person left 100l. for the education of four poor boys as many as might reside in the village. The school closed in 1816, the interest has been paid over to the treasurer, in aid of voluntary contributions. There are almshouses founded by Sir Thomas Crewe in 1663; and there have been various bequests of rents and money, applicable to the repair of churches, the maintaining of bells, and the relief of the poor. There is a handsome village hall.

(Leland's Itinerary; Bridge's Hist. and Antiq. of Northamptonshire; Baker's Hist. and Antiq. of the Co. of Northampton, &c.)

Brachypodine is a genus of insects of the order Hymenoptera, and family Ichneumonidæ (of Latreille). The insects of this genus are remarkable for the hiatus which there exists between the mandibles and the clypeus. The maxillæ are prolonged inferiorly; the second cibarial cell of the wing is considerably larger than the third; the clypeus is very prominent, and at this peculiar time are less developed and appear in the form of scales, or half-formed leaves. Of these the external are bracts, the next combine with each other and become calyx, the next assume the form of petals, and so on. Therefore whatever intervenes between the true leaves and the calyx is bract.

Bracton, one of the writers who are meant when the phrase is used 'our ancient law-writers,' or 'the ancient.
text-writers of our law." These writers lived from the close of the twelfth to the middle of the fifteenth century. The oldest is Gaimhile, whose era is referred to the reign of Henry II. and Richard I. Bracton lived in the reign of Henry III. He was learned in the Jewish and Saxon laws, and was acquainted with the writings of the unknown authors of 'Fleta,' 'The Mirror of Justices,' 'The Doctor and Student,' and the 'Old Book of Tenures.'

These books all relate to the nature, principles and operation of the ancient laws and constitution of the realm, and together with a few minor treatises, the collections of Welsh, Saxon, and Norman laws, the charters and statutes, the year-books which contain notes of causes and decisions, the records of writs, inquests, surveys, and of the receipts and issues by and from the king's revenue, and the incidental information to be found in the chroniclers, form a rich study of those persons who wish to become acquainted with the history of English judicature, of the courts for the administration of justice, and generally of the various operations of the English law.

Bracton's work is entitled 'De Consuetudinibus et Legibus Anglicis.' It is divided into five books, and the following is a slight sketch of the nature and object of the work.

In the first book he treats of distinctions existing in respect both of persons and things; in the second of the modes in which property may be acquired in things; in the third of actions or remedies at law. The fourth book is divided into several sections, which treat on the assize of modern, the assize of libel, the assize of real property, and in the law of the land, and the division of the land. The fifth book is also divided into sections, in which the author treats of the writ of right, essoins, defaults, warranty and exceptions. A larger abstract of the contents of this work may be found in Reeves' 'History of the English Law,' vol. ii. p. 86, &c.

A curious mention of a biblical in its arrangements, so precise in its statements, and so abundant in its information, must have been the work of some very able person. Little however is now known of this author. The writers to whom we are indebted for collecting what could be recovered of the English law, are divided into two classes, the Pitz, of whom the former lived in the reign of Henry VIII. and supplied Pitz, who was a Catholic writer in the reign of Elizabeth and James I., with most of the information which his work, valuable as it is, contains. Their statements that Bracton was a judge of the Common Pleas, and that he was Chief Justice of England, are now regarded as questionable. There is better reason to believe that he was a Henry de Bracton who delivered law lectures in the University of Oxford towards the middle of the thirteenth century. He was in the high court of chancery and once sat in the council in the reign of Henry III. The value of the work, and the high esteem in which it was held, is manifest by the numerous copies which were made of it before the invention of printing opened so much easier and cheaper a way of preserving and communicating all valuable works which it must have required to transcribe the work, and consequently the expense of it, may be collected from the extent of the work, which fills its printed form not less than 886 folio pages. Many of these manuscripts copy exist. It is said that there were no less than eight in various libraries which compose the book-department of the British Museum. In 1569 it was printed in a folio volume, and again in quarto in 1640, the text of the old edition being collated with that of some of the manuscripts. But this collection has not been employed having been lost.

An edition founded on one of the best of the existing manuscripts, compared with the rest and with the printed copies, would be acceptable, especially as the old editions, owing to the manner in which they are printed, are uninviting if not repulsive, and as Bracton is not included in the edition of our early law writers by Mons. Howard, a French lawyer, 4to. 1776, by whom they are printed with a French translation, to illustrate the connexion between the early jurisprudence of England and that of France.

BRADDOCK, EDWARD, lost his life in Virginia, by the French and Indians, in the war in which General Wolfe afterwards fell on the heights at Quebec in Canada. The French having determined to connect their Canadian colony with the English chain of fortified military stations which interfered with the British territories, General Braddock, with an army of 2000 English, was despatched to Virginia, where he arrived in February, 1755, at Richmond. With 390 waggons of provisions, ammunition, and baggage, he reached in July the Monongahela, a branch of the river Ohio. Washington, who was then at the age of twenty-three, joined him as a volunteer, in the capacity of aide-de-camp; and from his accurate knowledge of the ground, and a spirit of personal impossibility of war, would have furnished the English commander with the information requisite for the success of his expedition, but Braddock's self-sufficiency contemptuously disregarded the advice of American officers. Having advanced on the 30th of July within six miles of Fort Du Quene, near Newburg, where he supposed the enemy awaited his approach, his columns, in passing silently through a deep forest ravine, were suddenly struck with the utmost terror by the frightful war-whoop of the Indians from the dense thickets on both sides, and the noise of the battle raged with unspeakable fury and with infallible aim killed each his man. Rushing forward they were surprised and attacked in front by the French forces, while the Indian warriors, leaping from hundreds from their ambush, fell upon them with fury in the rear. Their strange and hideous appearance, and the echo of their swarming dog-yeap, in such a gloomy wilderness of trees, so startled the English soldiers, who for the first time heard it, that the panic which seized them continued until half the army was destroyed. With the single exception of Washington, who received several rifle balls through his dress, and had two horses shot under him, no one officer escaped alive. Braddock himself, after mounting in succession five horses, was shot, and carried off on a tumbrel by the remnant of his troops, who fled precipitously forty miles to the place in which they banded the night before. The inhabitants of Virginia, the inhabitants of which feared an invasion from the French, this disastrous defeat occasioned great consternation; and to the present day it is there a subject of interesting discussion, as connected with the career of Washington. The defeat of Braddock and his troops at the Monongahela-Campaigns against his Majesty's Indian Enemies, by Thomas Mante. 4to. 1761; Gent. Mag., vol. xxv. p. 378.

BRADFORD, GREAT, a par. and m. t., in the hund. of Bradford, Wilts, 93 m. W. from London, and 28 m. N.W. from Salisbury. It is situated on the Avon, near which is the Saxon name Benadford, or the broad ford over the Avon, which divides the town into two parts, called the Old Town and the New Town. Most of the buildings are arranged in three streets, rising one above another, on the brow and slope of a hill which rises abruptly on the N. side of the river: the situation is altogether very pleasing, as the banks of the riv. below the town abound in beautiful and picturesque scenes; and the well-wooded hills rise in some places boldly from the margin of the river. There are several fine old mansions and public offices. The church is very ancient and now very decayed. The town seems to have been a place of some consequence in the time of the Saxons. It was then the site of a monastic institution founded by St. Adhelm, who was himself the abbot, until appointed Bishop of Worcester in 705. It was given to the See of Salisbury, by King Athelstan, in 935, to the priory of Elingham, by Edwy, in 956, and to the Abbots of Ely, in 996, in atonement for the murder of his halbrother by Queen Elfrida. After this we hear nothing of a religious society at Bradford. Bishop Gibson says the monastery was destroyed by the Danes. In 954 the celebrated St. Dunstan was elected Bishop of Worcester, at a synod held at Bradford. It is only by its connection with such circumstances as these that the importance of a town in these early times can be estimated, or even its existence discovered. Bradford seems to have retained its former degree of relative importance after the Danes, and the gradual permanent establishment of the towns which were privileged by Edward I. to send members to parliament. It does not appear however that this right was exercised more than once. It is unknown whether it was over a chartered bor. with separate jurisdiction; but if so, it was relinquished before 1214. The town must soon have been lost. It is still however the chief town of the hund. to which it gives name. Monday is the m. d.; and there is a fair on Trinity Monday. Two justices of the peace administer the local government. The par. of Bradford, which is a little separate, contains, besides the town pop, when the pop. amounted to 10,102 persons, of whom 5249 were females. The pop. of the town is about one-third of the whole.

The town has for many centuries been noted for its fine broad-cloths, which have at all times formed its principal manufacture. 'The town of Bradford standith by cloth-making,' Leland said three centuries ago; and this is still true. The prosperity of the place is now also much pro-
he says that the latter, though "as large as Bradford, is not so quick as it."

During the civil wars between the royalists and parliamentarians, Bradford espoused the latter cause, held a besieged garrison containing 8000 men, and twice defeated the royalists. With Sir Thomas Fairfax at their head, the town marched against Leeds, and wrested that town from the cavaliers. They were however themselves defeated a short time after by the Earl of Newcastle on Adwalton Moor, with immense slaughter.

(Scatheby's "Hist. of Morley.") Though much the overawed, the republican spirit was not extinct at Bradford, and the popularity of their cause was soon made manifest throughout the country by the successes of Fairfax, the declension of the cause of Charles, and the decisive battle of Adwalton Moor.

After these wars Bradford made little progress for a long time, and it was much depressed, in common with other manufacturing towns, during the American revolutionary war. On occasion of the revolutionary war in France, when fears of invasion were predominant throughout England, the loyalty and patriotism of the people of Bradford were very conspicuous. They raised a corps of volunteers and furnished their number of men for the navy with little difficulty.

In 1812 a spirit of insubordination was diffused through the wide and densely-populated district of which Bradford is the centre, in consequence of the introduction of certain kinds of machinery which, by lessening the demand for manual labour, seemed opposed to the interests of the operatives, and at first threw numbers out of employment. The machinery involved the employment of the old looms of the towns, and the other for women, besides sundry small benefits for the relief of the poor.

(Leland's "Itinerary; Gough's edition of Camden's Brit."

BRADFORD: W. Ridding of the co. of York, and in the Morley division of the wap. of Morley. It is one of the new boroughs under the Reform Act, and sends two members to parliament. The town comprises the t. of Bradford, Manningham, Bowling, and Horton. The land is generally level and fertile, and let at 10l. rent and upwards. The returning officer for the co. is appointed by the sheriff of the co. The pop. of the par. of Bradford is 76,996, and includes the following t.:

Bradford, 23,233; Bowling, 5,938; N. Bierley, 7,251; Eccleshill, 2,878; Manningham, 5,364; Allerton, 1,733; Clayton, 4,469; Haworth, 5,523; Heaton, 1,452; Horton, 10,769; Shipley, 1,926; Thornton, 5,968; Wilsden, 2,292.

Bradford is one of the polling-places for the W. Riding members. It is 153 m. from London in a straight line; its measured distance from York is 74 m. and 52 f. from York. The area of the par. is about 33,710 acres; its length being nearly 15 m. and its average breadth 4 m.

History.—Bradford is situated on a small brook which falls into the Aire, and is at present very contracted; in early times the floods from the neighbouring hills, may have been sufficiently wide to have deserved the name of "Broadford," from which it is supposed the present name of the town is derived. This town is mentioned in "Doomsday Book" (Bardwain's translation, p. 141). In Saxton's map of 1579, formed part of the extensive par. of Dewsbury; it was afterwards included in the rich barony of Pontefract, which was in the possession of the Lacies. The whole district was immediately dependent upon Dewsbury in an ecclesiastical, and on Pontefract in a secular point of view (Tithe Book, p. 350.)

This powerful family had a castle at Bradford, which served as a protection to their retainers and other persons who would come to settle here from a less protected district; thus gradually would rise the vil, town, church, and market. The history of the town is connected with that of its castle; the Lacies had large possessions in Lancashire, and it is supposed that Bradford was their frequent resting-place in passing from Pontefract into that co. From an inquisition taken in 1316, it appears that the town consisted of 100 houses, and the tenants at will and villeins, would make its pop. amount to about 300. A corn-mill and a fulling-mill are mentioned in the inquisition; so that the rudiments of manufacture were early established. The last of the Lacies, Alice, having a large estate, sold the Hall of Lancing, to Bradford, incorporated with the other possessions of her family, went to increase the estates of that duchy. Leland mentions Bradford as a rising town that "stoodeth much by clothing;" comparing it with Leeds,
with yarn, besides employing a great number of looms themselves. Machinery, worked by steam, has almost superseded manual labour in the stuff-manufacture, the wallops, and handiwork generally done in the district. Stuffs manufactured at Bradford are chiefly dyed at Leeds, the proprietors of the dye-houses being among the largest purchasers in the Bradford market.

The iron trade has long flourished in the neighbouring towns of Keighley and Bingley. The historian of Sheffield, consider that the iron-mines of Yorkshire were explored by its Roman inh., and he mentions the "remarkable fact, that in the midst of a mass of scoria, the refuse of some ancient bloomery near Bradford, was found a deposit of Roman coins." There is an abundant supply of iron ore and coal, both of excellent quality; and the well-known ironworks at Bowling and Low Moor are only a short distance from Bradford. At these founries some of the most ponderous works in cast-iron are executed. A vast number of workmen are employed in the different departments of the establishments—from the raising of the ore and coal, to the various marketable states of the metal. These ironworks have the reputation of being carried on with great skill; the improvements of modern times having been successfully introduced in the different branches of the manufacture.

The principal merchants and manufacturers in the trades of Bradford are wool-staplers, wool-combers, worsted-spinners and manufacturers, worsted-stuff manufacturers, and woollen-cloth manufacturers. Several of the trades which are carried on in the immediate vicinity of Bradford are combined under the name of the trade, among which are the manufacturers for combs, shutters, and machinery. The proportion of other occupations is about equal to that of similar towns.

A seaport festival is held in Bradford in honour of St. Andrew, and is attended by the inhabitants. The festival is attributed. The day is kept with great rejoicing and gaiety, and the procession is witnessed by thousands of strangers from the neighbouring towns and villages. The Leeds Mercury, for the 5th of February, 1825, contains a good account of one of these festivals.

(Home's Every Day Book, vol. i. pp. 209—212.)

As a seat of commerce Bradford possesses many facilities. By the Leeds and Liverpool can., it has an unimpeded communication with Hull and the German Ocean, and with Liverpool. The Leeds, Bingley, Keighley, Skipton, and Gargrave; it enters Lancashire near Colne, and passes through Burnley, Blackburn, Chorley, and Wigan to Liverpool. By the Aire and Calder navigable canals, and the Leeds and Liverpool, are connected with Goole and Hull. The Leeds and Selby railway also connects the inland towns of Yorkshire with the Ouse, the Humber, and the German Ocean. The main line of the Leeds and Liverpool can. does not pass through Bradford, but m. in length, the streets of Bradford can., communicates between the town and that line.

The state of morals and health of the persons employed in the factory districts has often been misrepresented. In many cases the well-being of the young persons employed is strictly attended to. In Bradford and other towns of the district, instances might be given where the masters consider it an important duty to have their young workpeople morally and religiously educated. When the benefits of factory-schools are more apparent, such schools will become more effective, it is believed that they have begun: it may be safely affirmed that the owners of factories are generally wishful to do all in their power to promote the welfare of their workmen. On the physical results of the factory system, such works as those of Dr. Ure and Mr. Baines on the Cotton Manufacture, and that of the late Mr. Thackrah of Leeds on the Effects of Arts and Trades on Health, may be consulted; from which it will appear that the evils which have been charged upon the system have resulted from the vices and follies of individuals, rather than from any inherent tendency in the employment.

Places of Worship, Education, &c.—The par. church of Bradford, dedicated to St. Peter, was erected in the reign of Henry VI., the tower being of later date; a former fabric existed, which must have been comparatively small. (WY.) It has no remarkable exterior, and is mentioned by Rickman as being principally of the perp. style of architecture. Among its monuments may be mentioned a very beautiful work by Flaxman, for a gentleman of the name of Balme, in which old age is finely personified.

Churchest is erected in 1813; its interior is commodious, but externally it is heavy and possesses no interest.

The church in the parish of Keighley is about to be taken to provide additional church accommodation, which is evidently needed, where the pop. is so large and increasing, and where the existing churches are so well and regularly filled. The other places of worship in Bradford are for Catholics, Independent, and Nonconformists, all being well conducted and attended.

The academic establishment called Airedale College, which is at Undercliffe immediately near Bradford, is, for the preparation of young men for the ministry in the Independent church, and for the last year (June, 1837), more than double the number of students than was removed since its first establishment in 1835. Its station previous to the site it now occupies was Idle; its present prosperity is greatly owing to the addition made to its permanent endowments by a benevolent lady of Bradford, who has also been the chief cause of the erection of the commodious buildings now occupied by the college. The number of students has varied from fifteen to twenty.

The Baptists have a college at Horton which was established in 1835. It has been aided by gifts of money and premises, subscriptions and bequests of money and books; its present income is about 900l. a year. Upwards of 100 students have been educated or are now pursuing their studies in this institution, ninety of whom are settled as pastors of churches in this country or abroad.

The Wesleyan Methodists have established a seminary for the education of the sons of ministers at Woodhouse Grove, near Bradford; it was founded in 1812, and is said to be admirably managed, and to have been found extensively useful. Its design is to supply the children of ministers whose fathers hold in society, it contains 100 pupils, and is well supported by the religious body to which it belongs. The expenditure for this school and the kindred establishment at Kingswood, near Bristol (also containing 100 pupils), is £4,222, a little more than 200l. for each child. Of this expenditure the ministers whose sons are educated pay one-sixth. (Report of the Schools, for 1835; and Wesleyan Methodist Magazine for October, 1835.)

The grammar-schools of Bradford were in existence in the time of Edward VI. By the charter of 1663 it is called 'The Free Grammar-School of Charles II. at Bradford.' The usual powers for its government are vested in thirteen men of the most discreet, honest, and religious men of the several parishes of the town and neighbourhood of the town. The present school is an infants' and a siperior building, unpleasantly situated near the churchyard. An act of parliament was obtained in 1818, which empowered the governors to dispose of lands for the erection of a new school-building, and for the support of the school. These buildings, which were completed in 1838, are in every respect commodious, and in addition to the school-room there is a library and a porter's lodge. All boys of the par. are admissible free of expense. This school is one of those that has the privilege of sending a candidate for Lady Elizabeth Hastings's exhibitions at Queen's College, Oxford. The Archbishop of York for the time being is the visitor of the school. The present income arises from lands and buildings issuing out of freehold estates within the par. of Bradford. These estates have become so valuable, that the annual income is £150, which is more than sufficient to establish a writing-school, in which a number of children receive a useful elementary education.

There are schools in Bradford on the national system of education, and on the British and foreign system: a school of industry for girls, an infant school, and a school well-conducted Sunday-schools in the town or in the immediate vicinity. The Established Church has two Sunday-schools, the Wesleyan Methodists four, the Baptists four, the Independents three, and the Primitive Methodists one. We have not space to detail the returns from schools of other denominations, but from those which have been obtained an opinion may be formed of their efficiency, and of the high character they sustain.

The Parish Church Sunday-School contains 448; Christchurch Sunday-School . 320 330
Baptists' Sunday-Schools . 490 510
Independents' Sunday-Schools . 448 438
Wesleyans' Sunday-schools . 1,000 500
The National and British Schools each require a small weekly payment from the children; their numbers are:

The Institute School (including boarded scholars) 150 School of Industry (the limited number) 60

A mechanics' institute was established in 1829, which is well sustained, and has about 450 members: there is also a philosopical society. A subscription library and newsroom occupy a portion of the exchange-rooms, and other apartments in this elegant building are devoted to public meetings and to periodical concerts. A library and depository of works published by the Christian Knowledge Society is attached to one of the Church Sunday-schools, and the Bible is distributed by the other societies, which have active auxiliaries. The dispensary, established in 1826, is liberally supported and well managed. A branch society to the county institution for the deaf and dumb at Doncaster furnishes considerable funds to that establishment in annual subscriptions. Bradford has several minor charities for the sick and poor, similar to those of other towns. The gas works were established in 1822; the new market, a plain and extensive building, was opened in 1824. There are two establishments for supplying the town with water; and it may be said that every comfort and convenience is accessible to the inquirer. The savings bank has been found very beneficial to the operatives of the district; and the Temperance Society has a large number of members. It is worthy of record that English Temperance Societies were organized at BD in 1838 and 1841. The guildhall is a building of two stories, which are occupied annually at a vestry meeting, and nominated by the retiring officers; one of them is for the E. and the other for the W. end of BD. There is a court of requests for the recovery of debts under forty pounds' value. BD and the Honour of Wetherby are in the same county, and in which debts may be sued for under five pounds. The peace hall was for many years used as a court-house for the meeting of the magistrates, and for holding the quarter-sessions. A new and ornamental building has just been completed for a court-house, which is intended to be one of the most prominent as well as general aspect of BD is that of opulence and respectability; it is chiefly built of a fine light freestone; during the last ten years, whole streets of elegant buildings have risen up, chiefly consisting of warehouses, and are an evidence of the increasing commerce and wealth of the town. The country to the N. and W. is open and picturesque, and is adorned with the residences of the more opulent merchants.

The occupations of the families in the par. of BD, according to the Enumeration Abstract of Population for 1831, were as follows:

- Families employed in agriculture: 790
- Families employed in trade, manufactures, &c.: 10,913
- Families not comprised in the preceding: 3,326

15,049

The t. of BD par.—Bowling, formerly Botting, about a m. and a half S.W. of BD, was once the manor and residence of a family of that name. The hall is an ancient building, and was the head-quarters of the Earl of Newcastle in the year 1642 during the siege of BD. It was here, while in bed, after he had formed the purpose of giving up of the inhabitants of BD to military execution, that he was dissuaded from his intention by a female apothecary, who supplied him with opium which really appeared to him and mesmerized him with his san- guinary determination, or that a dream produced the effect. Bowling has been mentioned as the seat of extensive industry.

North Bailey is about two m. S.E. from BD; its inham employed in the ironworks, the mines and quarries, and the woollen trade. The hall was the residence of Dr. Richardson, a man of refined literary taste, who gave up much time to horticultural pursuits. There is a neat episcopalian church, and the manor is occupied by a gentleman of the name of Clayton.

Eccleshill, Manningham, Alkerton, Haworth, Heaton, and Clayton, are all scattered villis, at short distances from BD; their populations are chiefly employed in the stuff and cloth manufactures. At Manningham is the beautiful seat of E. C. Lister, Esq., one of the members for the br. of BD.

**Horton** is the most populous and important of the smaller t.; it possesses a free-school which was founded and endowed by Christopher Scott, in the reign of Charles I. In this school 200 children are instructed. There is also another school in which sixty children of some neighbouring hamlets are instructed free. The place of worship are a small episcopal chapel, and large chapels for the Primitive and Wes- leyan Methodists. The Baptist seminary is at BD.

**Shipley** is three m. N. from BD. A church was built here in 1823, which will contain about 1500 persons; there are large chapels for the Baptists and Wesleyan Methodists. Worsted, woollen cloth, and paper manufactures are here carried on.

**Thornton** is about four and half m. W. from BD; it has numerous manufactures of stuffs, a church, an Independent chapel, and a Methodist chapel. It has a school maintained by subscription; some of the children are instructed in the classics. This school has an endowment of about 50£. a year, derived from various benefactions. There is also a school on the national system.

**Wilden** is five and a half m. N.W. of BD; it has a beautiful new church, an Independent chapel, and two Methodist chapels; it is a flourishing t., and, like the others in the par. of BD, indicates by its appearance the prosperity and activity of its pop.

**Abraham Sharpe,** the celebrated mathematician, and musician, was born in 'Little BD, about 1631.'

Dr. Richardson was born at Bierley Hall, in 1664. He took the degree of M.D. at Oxford, but never practised. He devoted his life to literature, horticulture, and the study of antiquities. He built a hot-house, which was ever con- stantly heated in the N. of England was 100 feet long, 36 feet wide, and 65 feet high, planted with cedars of Lebanon which he planted still remains there, a splendid specimen of this beautiful tree. It was sent sent to Dr. Richardson from Sir Hans Sloane.

**John Sharp,** Archbishop of York, was born at BD in 1644; he was a man of strong principles, and of general abilities. He died in 1718, and was buried in York minster, where an elegant monument was raised to his memory.

**The: &c. ,我们要 refer to the reader to the excellent and minute account of him in the Oxford edition of his Miscellaneous Works and Correspondence,' Oxford, 1832, by professor pearce.**

His father, William Bradley, married Jane, the sister of the Rev. James Pound, known by the observations of the comet of 1680 which he supplied to Newton, together with other observations referred to in the 'Principia.' With the uncle James Pound Bradley passed much of his time, which he found in his house the means of applying himself to astro- nomical observation. As early as 1716 there is a letter of Halley to Pound mentioning Bradley as an observer; and in 1716 and 1717, we find some accounts of double stars observed by Bradley and Mr. John. Two of these have since been found by Sir J. Herschel in his determination of the orbits which each of the pairs just mentioned describes round the other ("Mem. R. Astron. Soc." vol. v. pp. 155, 202). At the same time he turned his attention to the motions of Jupiter's satellites, and detected, by comparison, the greater part of the inequalities afterwards discussed by Bailli. Tables of the satellites, from Bradley's observations, were published in Halley's collection, London, 1749, and in"Phil. Trans." xxvi.

Bradley was entered of Balliol College, Oxford, in 1710, and took the degrees of B.A. and M.A. in 1714 and 1717. In 1718 he became a fellow of the Royal Society. In 1719 he was ordained to the rectory of Bridestow, in Monmouth- shire. In 1720 he obtained another living, but in 1721 he was reappointed as a fellow of Oriel College, Oxford, and in 1722 he was appointed professor of astronomy at Oxford, with the holding of which they are incompatible. He also resided the offer of chaplain to Bishop Holdy. We find him now engaged in miscellaneous observation, particularly with the long telescope introduced by Huygens. With one of these of 912 ft. focal length, he measured the diameter of Venus in
1722. Pound died in 1724, and in the next year Bradley began the observations which led to his great discovery.

The circumstances connected with the discovery of aberration are already described. The scene of the first observations was at the house of Mr. Molynex at Kew, which afterwards became the palace of that name, lately pulled down. The phenomenon of aberration, "as understood," is supposed to consist in the observation that the change of wind was owing to the approaching or retiring from the shore. The boatmen told him that it always happened at sea, and explained it to him in the best manner they were able. The explanation struck him, and set him a musing on an astronomical phenomenon which he had been puzzled by for some years. This account differs in some material points from that of Dr. Thomson, and is not given by Dr. Robison in terms which imply that he considered himself as the authority. Perhaps further investigation will enable us to determine.

Upon this discovery, several observations must be made, relative to its importance in astronomy. It is the first positively direct and unanswerable proof of the earth's motion. In the next place, the explanation given was not purely an hypothetical one, or one which would allow of any velocity being attributed to light which would best answer to observed phenomena, but required that the velocity already measured by Römer's observations of the retardation of the eclipses of Jupiter's satellites should be the supplementary consequence of the annual motion of the flattened sphere.

A very simple geometrical analysis of the problem shows that when the angle of aberration is greatest, its sine must be the quotient of the earth's velocity divided by the velocity of light. Taking the first at 18 miles per second, depending upon the description of the great orbit, and of the length of the year, and the second at 200,000 miles per second, which depends upon a third and distinct phenomenon, namely, the observations of the time of eclipses of Jupiter's satellites at different periods of the year, we find a priori that the sine of one of the greatest angles of aberration there be, must be .00009, which is the sine of 19 seconds nearly, and has been made in round numbers. The greatest aberration from the mean place observed by Bradley was 20 seconds and two-tenths, in which the most correct modern observations, in masses of the phenomena at a time, are not shown an error of more than three-tenths of a second. This is one of the reasons why we have said that, in the union of theoretical sagacity with practical excellence, Bradley stands unrivalled. Newton, Laplace, &c. were not observers. Flamsteed, Cassini, &c. were not great philosophers. Halley, who of all the men of Bradley's time, united the largest knowledge of both, was so far from being the equal of Bradley in minuteness of observation, that he constantly declared his suspicion of the impossibility of detecting a phenomenon so small as one of the results of Kepler's laws which phenomena follow, but not in that of physical causes. In our opinion, Hipparchus is (difference of circumstances considered) the prototype of Bradley. The time of the discovery of the cause of aberration was probably 1725 or 1726. The first public announcement was in a letter to the Royal Society, No. 535, where it might be inferred that both the phenomenon and the cause were discovered in the same year), and was communicated immediately to the Royal Society (Phil. Trans. No. 406, vol. xxxv., p. 637). In 1728 Bradley published in Oxford, and communicated to the University. We pass over the various labours of which he sustained the character of the 'best astronomer in Europe,' given to him by Newton, and proceed to the year 1742, when he was appointed astronomer royal. This is also a subject of the same importance. The act of laying the foundation of the observatory, which, as Professor Newton has well observed, appears to have determined that one of the first points he would secure before his retirement was the nomination in question: he declared his intention of resigning in the House of Commons on the 2nd of February, and Bradley's appointment was dated the 3rd. From this time to 1747 he was engaged (among other things) in the career of observation which led to his second great discovery of mutation, communicated in that year (Phil. Trans. No. 465, vol. xxxiv., p. 662). The phenomenon may be thus represented: the earth's axis, instead of describing a cone, describes a flattened cone; or, the pole of the equator, instead of moving uniformly round the pole of the ecliptic in a small circle, describes a wave or undulating curve with a curved edge, if we may so speak, with about 1400 undulations in a complete revolution. The merit of
Bradley consists, firstly, in his determination of so small a quantity, since the greatest effect of nutation is only half that of aberration, and distributed through 19 years instead of one; secondly, in his discovery of the circumstance on which it depends, namely, the position of the moon's orbit with respect to the equator. This orbit shifts the position of its nodes gradually, and moves through a revolution every 184 years. This was also found to be the period in which the pole of the equator describes one of the waves above mentioned, and subsequent investigation has confirmed the period of the greater part of the nutation on the motion of the moon and Earth. ... the consequence of the non-sphericity of the earth, and of the moon's attraction on the protuberant parts. [Nutation.]

There is a third investigation of Bradley which stands out among all his other accomplishments. He approached the sagacity: we refer to his empirical formula for the law of refraction. He was assisted in the necessary computations by Maskelyne, who first appeared before the world as the pupil of Bradley. In this very delicate research, the latter had again gone beyond his contemporaries in the evaluation of minute quantities. His table is even yet very good for the first forty-five degrees of zenith distance; and his determination of the latitude of Greenwich (an investigation depending for its accuracy upon that of the tables of refraction) does not differ more than half a second from that deduced by Mr. Pond from 729 observations with both the mural circles.

In 1751 the alteration of the style took place, and Bradley appears to have had some share in drawing up the necessary tables. In 1757, Lord Kames, who had been a long time a friend, and the seconder of the measure in the House of Lords, and Mr. Pelham, then minister, with his advice on the subject. But this procured him some unpopularity, for the common people of all ranks imagined that the alteration was effected by the king and his ministers as a means of their natural lives, and called Bradley's subsequent illness and decline a judgment of heaven. This was, as we know, the last expiring manifestation of a belief in the wickedness of altering the time of religious anniversaries which is always apparent in ages of superstition and in different periods, for 1400 years. In the same year Bradley obtained a pension of 250L. from the crown. From that time he continued his observations, of which we shall presently speak, till the 1st of Sept. 1761, in the observations of which date his death. He lived for the last time to 22 years of age, and in registers. He then retired among his wife's relations at Chalford in Gloucestershire, where he died July 13, 1762, and was buried at Minchinhampton. His health had been failing for some years, though he was originally of a strong constitution, and he died of a consumption. He was buried in his grave before him in 1757, and left one daughter, but his line is now extinct.

Thus far we have obtained our materials for facts from the life by professor Rigaud, above cited. This account does not begin to unfold the phenomenon of the observations made at the observatory of Greenwich, nor does the life in Kippis's Biographia Britannica. The following is Dr. Maskelyne's account (Answer to Mudge's Narratives, &c. Lond. 1792): — Dr. Bradley's valuable observations were made in the course of twenty years from 1742 to 1762, and consist of thirteen volumes in folio. They were removed from the Royal Observatory, before I was appointed to the care of it, by the doctor's executors, who thought proper to consider them as private property; and during the last six years of his life, it was impossible to recover them, they were presented in 1776 to Lord North, now Earl of Guilford, Chancellor of the University of Oxford, and by him presented to the University, on condition of their printing and publishing them. The University put them immediately for that purpose into the hands of Dr. Hornby, Savilian professor, &c., whose bad state of health has been alleged as the cause of the delay of the publication. The account of Dr. Hornby, in the preface of the publication in question, differs from the preceding in two particular points. The above would allow us to infer that the University of Oxford accepted a donation the right to make which was under litigation, with a strong primâ facie case against it. Now Dr. Hornby mentions, 1. What is very well known, that both the predecessors of Bradley and the present, though they have not considered their own observations as their own property; that the former printed, and his executors published, his observations as private property, and that the daughter of the latter received compensation for relinquishing her right to her father's papers; 2. That a salaried office of only 100L. a year, with the duty of improving as much as possible the planetary tables, and the method of finding the longitude, by no means implied an obligation to consider the actual observations made under this provision as the property of the University.

3. That the Royal Society having first made and abandoned a claim, the government instituted its suit in 1767, and abandoned it in 1776, before the observations were presented, not to Lord North personally, but in trust for the University, for which he was an officer, under the condition that had pretended a claim to the property of the work, which, though dormant at the time, the University could not know to have been formally abandoned. And it has been suggested to us, that there is no method of abandoning a suit in the Exchequer, as a practical relinquishment of proceedings is no in law that court to their revival at any future time. The observations in question were published at Oxford in two volumes; the first in 1798, under the superintendence of Dr. Hornsby; the second in 1809, under that of Dr. Abraham Robertson. They go from 1750 to 1765, and are about 60,000 in number.

But these observations might have remained a useless mass, except for occasional reference, to this day, had it not been for the energy of a distinguished German astronomer, Dr. J. P. G. G. Schröter, who published in the Königsberg successively, and from 1807 to 1818, added to his other laborious occupations the enormous task of reducing and drawing conclusions from all Bradley's observations, published in the latter place and year under the title of Fundamenta Astronomicae. Of the deductions ex observationibus viri incomparabiles James Bradley. 'This work has always been considered one of the most valuable contributions to our astronomy. It exhibits the result of all Bradley's observations of stars, reduced on a uniform system, and is always reduced and interpreted as the representative of Bradley's observations.' (Progr. Roy. Rep. Brit. Ast. vol. i. p. 137.)

It may be said that Bradley changed the face of astronomy. The discoveries of aberration and nutation, and the improvement of the tables of refraction, are due to minute observation, and the tact with which every instrument was applied to the purposes for which it was best adapted, were so many great steps both in the art and science. Before his time every instrumental improvement was a new cause for debate and discussion. The cloud of loose baffle all attempts both at finding laws and causes. Nevertheless, the name of Bradley hardly appears in popular works, nor will so do until the state of astronomy is better understood. Let any man set up for the founder of a sect, who has given his name to one of the stars, and is beloved for the structure of attraction, or the structure of the moon; let him exalt himself in the daily papers, and he must be unfortunate indeed if in three years he is not more widely known in this country than its own Bradley, one of the first astronomers of any.

BRADSHAW, JOHN, president of the court which tried Charles I. Bradshaw was of a good family in Cheshire. His mother was a daughter and coheir of Ralf Winnington of Offerton. Noble and Chalmers state that in the plague they were allowed to consider the peers were desired to acquit, he was appointed one of the three commissioners of the great seal for six months; and in February following, by a vote of both houses, chief justice of Chester. In June, 1647, he was named by the parliament one of the council to prosecute the royalist Judge Jenkins. October 12, 1648, by order of the parliament, he received the degree of sergeant.

No. 312. [THE PENNY CYCLOPAEDIA.] Vol. V. 271
On January 1st, 1648-9, was adjudged by the Commonwealth to be the head of the land; it is true, in the king of England for the time being to determine peace or war against the parliament and kingdom. On the 4th an ordinance was passed for erecting a high court of justice for trial of the king. The commissioners for the trial of the king elected a hotel of six. Bradshaw, president. Lord Clarendon says that at first he seemed much surprised and very resolute to refuse it. The offer and the acceptance of it are strong evidence of Bradshaw's courage and the staunchness of his republicanism.

The 12th John Bradshaw, Serjeant-at-Law, who is appointed president of this court, should be called by the name, and have the title of Lord President, and that as well within as without the said court, during the commission and sitting of the said court. The deanship however was given to him himself and his posterity; and the sum of 5000L. allowed him to procure an equipage suitable to the dignity of his office. The parliament further settled 4000L. a-year upon him and his heirs, in landed property. He was also made Chancellor of the Duchy of Lancaster. He had previously been appointed Chief Justice of Wales and of Chester, besides being Lord President of the Council of State. The accumulation of so many offices in one man certainly looks something like pluralism in the Commonwealth: and unless great care be taken to account of the dignity of the work done, the remuneration must appear somewhat disproportionate to the quantity of it.

When Cromwell seized the government, Bradshaw was one of those who offered all the opposition in their power, and on the execution of Charles, was in Bradshaw, fidelity and firmness, almost equalled Ludlow's. His bold answer to Cromwell, when he came to dissolve the council, is well known. When Cromwell insisted upon every one's taking out a commission from himself, if they chose to retain their places in the government, Bradshaw refused, alleging that he had received his commission as Chief Justice of Chester, to continue quanduam se bene gesserit, and he should retain it without any other, unless he could be proved to have justly forfeited it by want of integrity; and that the commission should be tried by twelve Englishmen. He soon after set out on the circuit, without waiting further orders; nor did Oliver think it prudent to prevent or recall him, as he had said nothing but force should make him desist from his duty.

It was not to be expected that such conduct would find much favour in the eyes of Cromwell. He attempted to oppose his election for Cheshire; and though Bradshaw was returned by the sheriff, as others in the Cromwellian interest returned another, neither sat, it having been so decided by the resolution of the House. But although doubt may exist, and popularit must have been very considerable; for, notwithstanding his having been engaged in several designs against the power of Cromwell, one of which was connected with the Fifth Monarchy-men, who were to destroy and pull down the kingdom, and other kings and nations. He was fetters of iron, his highness did not dare to seize him, but continued to watch and defeat his designs with his charac-

teristic policy. Bradshaw however was deprived of his office of Chief Justice of Chester. The two former friends withdrew each other with the vigour of two crouching tigers, each waiting for the exact moment to make the decisive spring that was to destroy the other. And we may give some credit to the observation of certain of the royalist writers, that Bradshaw would have had no objection to pull down the kingdom, and all other kings and nations. He had performed for Charles, the hereditary one; and that he would not have been sorry to have had an opportunity to convince the world that he was no respecter of persons.

On the death of Oliver, and the abdication of his son Richard, Bradshaw obtained a seat in the Council of State, was elected Lord President, and appointed a Commissioner of the Great Seal; but his health, which had been some time declining, became so precarious that he was unable to perform the duties of that office.

The Commonwealth's life was consistent with the free and brave spirit which he had always shown. The army had again put a force upon the House of Commons, by seizing the Speaker, Lenthall, on his way thither, and thereby suspending all further proceedings of the existing government. The almost ebbing but unabated spirit of Bradshaw felt the insult. He repaired to the Council of State, which sat that day; and when Colonel Sydenham, one of the members of the council, endeavoured to justify the army in what he had done, according to the cant of the day, that they were necessitated to make use of this last remedy by particular call of the Divine Providence; ' weak and extremated as he was, says Ludlow; yet animadverted by his ardent soul and strong sense, to the public employment. He survived this but a few days, dying November 22nd, 1659, of a quartan ague, which had lasted a year. 'A stout man,' says Whitelock, 'and learned in his profession: no friend to monarchy. He declared, a little before his death, when his strength was apprehended to return, he would be the first man that should do it.' He was buried with great pomp in Westminster Abbey, whence his body was dragged at the restoration, to be exposed upon a gibbet, with those of Cromwell and Ireton.

The leading feature in Bradshaw's life — that which makes his name the property of history — was his acting as presiding judge in the trial of the king; a transaction, in the words of Hume, 'the pomp and dignity, the ceremony of the court, the committing and condemning to death, the proceedings in the annals of human kind — the delegates of a great people sitting in judgment upon their supreme magistrate, and trying him for his misgovernment and breach of trust. How did he conduct himself on that occasion? What was his part in the other impeachments? What was his character, and bearing, and humanity, which befitted his high office? or, as asserted by Clarendon, 'with all the pride, impudence, and superciliousness imaginable'? Did he, in the words of Noble, behave to 'fallen majesty with a rudeness that those who sit in a criminal court never use to the lowest culprit'? What was the fact? Charles having repeatedly refused to acknowledge the authority of the court, Bradshaw addressed him thus: — Sir, this is the third time that you have publicly disowned the court, and the second time you have promised to be known by their actions; you have written your meaning in bloody characters throughout the kingdom. Ludlow says, that to Charles's repeated assertions that he was responsible only to God, Bradshaw answered, that 'seeing God had, by his providence, determined the court was determined to do so likewise.' Bradshaw, on giving sentence, resorted to precedent. He instanced the case of many kings who had been deposed and imprisoned by their subjects, particularly in Charles's native country, and asked, why not a king of England? He adduced examples of either being dethroned, or proceeded against for mis-government; and even the prisoner's own grandmother removed, and his father, while an infant, crowned in her stead. (Rushworth, vi. p. 1396. ; Whitelock, p. 376. ; Ludlow, Hutchinson, Clarendon.)

His will, which is dated March 22, 1653, contains several remarkable facts. He directs his brother Henry to expend 700L. in purchasing an annuity for maintaining a free school at Marple, 500L. for increasing the wages of the master of Bunbury school, and 500L. to increase the wages of the master and usher of Middleton school. There are two codicils to the will; and by one dated September 10th, 1655, he gives 10L. to John Milton. The will was proved December 16, 1659. (Ormerod's Cheshire, vol. iii. p. 409. ; and the charter of John Milton, in the Defensor Secundae pro Populo Anglicum.)

BRADY, NICOLAS, a divine whose name is known chiefly in connection with that of Nathan Tate, his versifying collaborator, in producing the new version of the Psalms of David, which has since become generally used in the Church of England, in the place of the obsolete version made in the reign of Edward VI. by Sternhold and Hopkins. Brady was the son of an officer in the royalist army during the civil war in 1641, and was born November 3rd, 1601, at Bandon, a town in the county of Cork. At the age of twelve he was sent to Westminster school, whence he proceeded to the college

* Supreme magistrate is a contradiction in terms; supreme being applicable only to the sovereign, and magistrate a name for a subject. Hume, though he professed to write on government, never seems to have understood the meaning of sovereignty, though Hobbes had made it sufficiently clear.
* Lives of the Regicides, i. 66.
of Christ-Church, Oxford. He subsequently graduated at Trinity College, Dublin; which, in testimony of his zeal and merit, was presented to him by the Mayor and Corporation. He was also gratuitously, during his absence in England, the degree of D.D. He was appointed chaplain to Bishop Wettenhall, by whose patronage he obtained a prebend in the cathedral of Cork. At the time of the Revolution he made himself conspicuous for his attachment to the English parliament, on occasion of the petition for redress of the grievances which they had suffered under James; and remaining in London, he became minister of the church of St. Catherine Cree, and lecturer of St. Michael's in Wood-street. He was afterwards appointed to the chaplaincy of the Queen of Roses, and then chaplain to King William and Queen Mary. He held also the office of minister at Richmond in Surrey, and at Stratford-on-Avon in Warwickshire. From his several appointments alone he derived at least 600l. a year; but being a bad economist, he was obliged, for the purpose of increasing his income, to undertake the keeping of a school at Richmond. He died at the age of sixty-six, on the 20th of May, 1726: the same year in which he published by subscription his 'Translation of the 'Heads of Virgil,' in 4 vols., 8vo, which is still in great vogue in this country. The smaller productions are a tragedy, entitled 'The Raep, or, The Innocent Impostors.' He published at different times three volumes of his sermons, of which three additional volumes were published after his death by his son; but the reputation derived from these has never equalled that attached to his metrical version of the Psalms; of the merits of which every one who possesses a Prayer Book may judge for himself.

BRADY [At and S IoR.] BRAGA, a comarca of Portugal, situated almost in the centre of the kingdom, on the banks of the Minho, and surrounded by the districts of Barcelos, Viana, Valença, Amarante, and Guimarães. The territory, though very mountainous, contains some fertile valleys, which being sheltered from the northern winds, enjoy a high degree of temperature. It is watered by the Minho, a river which forms a part of the boundary between Portugal and Spain. The farm of one of these formers rises in the Serra de Gerez, N.E. of the capital of the comarca, and flowing S.W. empties itself into the sea near Esposende; the latter has its source E. of the same capital, and flowing in a direction nearly parallel to the former, enters the ocean near Vila-do-Conde. The productions of the soil are the same as in the rest of the prov. The whole district comprises one city, one town, and 101 par., containing a pop. of 49,838 in. The chief occupations of the people are agriculture and the manufacture of hemp. Braga, the Braccara Augusta of the Romans, the capital of the comarca, is one of the most ancient cities in Portugal, and was the capital of the kingdom when the Suevians were masters of it. It is now the seat of an archbishop, who is the primate of Portugal. Until recently ruins of a Roman amphitheatre and an aqueduct existed; but at present no remains of its ancient grandeur are found, except some coins, and five milestones belonging to the five Roman roads leading into Braga, which one of the archbishops removed to Rome. The town is situated on an eminence in a fertile valley watered by the riv. Deste on the S. and by the Cavado on the N., and is about 15 m. from the sea. This valley is covered with quinias or country-houses, and planted with oak, willow and hazel. The oranges and lemons of Braga are the best in Portugal. About 3 m. E. of the city stands a lofty hill, commanding a delightful view of all the plain, on the summit of which is built the renowned sanctuary of Senhor de Mosal: Monte. The city itself contains nothing remarkable. The streets are very narrow and irregularly laid out. There are two squares, and a great number of fountains. The principal building is the cathedral, a stately fabric of the old perpen- dicular style, which was erected at the time of Henriques, the first of Portugal. The pop. of Braga is reckoned at 27,097. 41° 39' N., lat., 8° 23' W. long.

BRAGA, a comarca of Portugal, in the prov. of Tras-os-Montes, and in its northern extremity. It is sur- rounded by the Spanish provinces of Leon and Galicia, and by the Portuguese comarcas of Charaz, Mirandela, and Moncorvo. The territory is very mountainous, being crossed in every direction by the ramifications of the serras and mountains, and is divided into many valleys, in which rich crops of grain and fruit are raised. The district is irrigated by a number of large streams, all of which flow generally from N. to S., and are affluent of the Duero. The district contains 988,600 acres, and has 1 city, 10 towns, and 34 parishes.

BRAGANÇA. Bragantino, the capital of the district, is situated in a very agreeable and fertile plain on the Tormena, an affluent of the Sabor; it was erected into a duky by Alonso v. in 1444, the eighth possessor of which, claiming only to the titles of Count and Earl, was raised to the throne of Portugal in 1460, under the title of John IV. From that king the present royal family of Portugal is descended. The town was formerly a fortified place, and now contains a castle almost in ruins. It has nothing remarkable except one large square with four gates and towers, and is the residence of the nobility and gentry of the place hold their races and other amusements of chivalrous origin. Pop. 3373; 41° 51' N., lat.; 8° 40' W. long.

BRAGANÇA, house of, is the original title of the reigning dynasty of the kingdom of Portugal. The origin of the Bragança family dates from the beginning of the fifteenth century, when Afonso, a natural son of King João, or John I., was created by his father duke of Bragança and lord of Guimarães. Afonso married Beatriz, the daughter and heiress of Lizandro, lord of Bragança and Ourem. From this marriage the line of the dukes of Bragança, marquises of Villavicousa, &c., has sprung. By the fundamental laws of the Portuguese monarchy, passed in the Cortes of Lamego in 1389, all foreign princes are excluded from the crown of Portugal, and the right of succession is by nature by male issue, Antonio Prior of Crato, and natural son of the Infante Dom Luis, Henriques's brother, claimed the succession, but Philip II. of Spain, whose mother was a Portuguese prin- cess, urged his own pretensions to the crown of Portugal in view of the marriage of his sister Maria to Philip II., who resided among the means of an army commanded by the duke of Alba. [Anto- nio: Alba.] The Portuguese submitted, Antonio died an exile, and Philip and his successors on the throne of Spain continued to hold the crown of Portugal also till 1840, when the Portuguese, weary of the Spanish yoke, revolted and proclaimed Dom João, the then duke of Bragança, their king, he being the next remaining heir to the crown. He assumed the title of João IV., and was styled 'the fortunate.' The crown of Portugal has continued in his line ever since, João IV. was dethroned by Charlemaign in 1787, and his son being dethroned in 1688 for his misconduct, his brother Pedro assumed the crown. Pedro was succeeded in 1706 by his son João V., who, dying in 1750, the crown devolved upon his son Joseph I. Joseph was succeeded in 1777 by his daughter Dona Maria I., who after her death in 1805, was succeeded by her son Dom João VI., who was succeeded in 1826 by his son Dom Pedro IV., who was succeeded in turn by his son Dom Carlos I., who after his death in 1853, was succeeded by his daughter Dona Maria II., who, on the death of her husband Don Pedro V., was succeeded in 1861 by her brother Dom Pedro VI., who renounced the crown in 1862 and left it to his nephew Dom Pedro II., who was deposed in 1822 by the French army and fled to Brazil, where he was assassinated in 1832. His son Dom Pedro II. was proclaimed emperor of Brazil, which became thereby independent of Portugal. In 1826 King John VI. died at Lisbon, and his son Dom Pedro being considered as a foreign sovereign, Dom Pedro's son, Dom Maria II., was proclaimed queen of Portugal. Dom Pedro was deposed in 1834 and fled to France, and died in September, 1834, at Lisbon. His son Pedro II. is now (1835) emperor of Brazil.

BRAHE, TYCHO. The influence which the labours of this greatest navigator was exercised upon the science of his own and succeeding ages would, more minute detail of his life than we can here give. It will be convenient to place all references to this article at the beginning of this article, which we shall accordingly do. (See also his innumerable references in Astron. And Cat.)

The life of Tycho Brahe was written by Gassendi; first edition, Paris, 1654, with copperplate crown in the title-page; second edition with two title-pages, both 'Hage Comitum,' the first, 1655, marked 'Editio secunda accuratior et correctior,' the second, 1664, without any mark of second edition, and with an empty space for the crown. The two editions do
not appear different in matter. Both contain the "Oratio Funebris," Sec. of John Jesenius. See also Teisser, "Elogies des Philosophes," 1783; Brieni of Johannem Kepler, Sec., 1718; Riccioli, "Chronicon in Almageste Novo," v. i. p. 46. For modern accounts of his astronomy see Delambre "Ast. Mod.;" and in English the chapter on Tycho Brahe and Kepler in Nunneren's "Astronomy," 1833. The life in the "Biot. Univ." is by Malte-Brunn. The writings of Tycho Brahe are as follows. The capitols serve to separate different works.

(A) "De Novo Stellaris," anno 1572, Sec., "Hafniar," "Copenhagen." Extraites, sources, afterwards inserted in the "Progymnasmata," English translation, 1582 (copy in the Bodleian, Hyde, cited by Lalande). (B) "De Mundi Aetherii recenterorum Phenomena liber secundus," cuius est de illustri Stellaris Cantald anno 1577, conspecta 1589. Is Lalande reasonerit anno 1600. (C) "Oratio Funebris," respect to his description, but with title marked Prague, 1603; we cannot find it at the end, as he says. The statement in the preface is not the same as he gives, but the point is of little importance. (C) "Apologiae Responsoria," etc., the paralax of comets. (D) "Epistolarum astronomicarum," Lurinburg, 1596; some have on the title-page of the Frankfort, 1618, others Nuremberg, 1601. (E) "Astronomiae Instauratae Mechanica," Waningsburg, 1598, reduced to the New System, Nuremberg, 1600, 1609. (F) "Astronomiae Instauratae Progymnasmata," begun at Uraniborg, finished at Prague, 1601 (in the title-page) published posthumously; the executor's preface is dated 1602, and the posthumous work has the great advantage of Tycho's notes and results of observation, though headed from beginning to end "De Novi Stellaris, anno 1572." The treatise (B) with title-page, Prague, 1603, is always called and sold as the second volume of these "Progymnasmata," and though it treats of various other matters, is headed throughout as "De Cometa," anno 1577. And (D) is very often a made third a volume. The same works (all three), with alteration of title-page only, Frankfort, 1610. (G) In the "Culi et Silvester, Sec. Obse-ervations," etc., Leyden, 1818, are two years' Bohemian Observations, 1576-1577. (H) "Oratio Funebris," etc., of the "Cometis Oratio in qua Astrolapiae defenditur," an academical lecture of 1574, printed, not by Tycho, but by Curtius, Hamburg, 1621. (I) "Geistreiches Weissagung," Sec., 1632; translation of (A) with the astrological part, omitted in (F), date 1632, no place mentioned by Lalande, 1607. (K) "Sacrae Omnia," Frankfort, 1648, reprint of the two first in (F).

(L) Lucius Barretti "Sylloge Ferdinanda," Vienna, 1637, contains Tycho's observations, 1582-1601. (M) "Historia Coniunction," Augsburg, 1666, by this same Barreti, contains Tycho's "Instauratae Mechanica" and "Oratio Funebris," Vienna, 1666. Ratisb., Dilling., 1670. Errors pointed out in Barbolinius, "Specimen recognitionis," Sec., Copen., 1658. (N) Kepler, "Tabulae Rudolphinae," Ulm, 1627. These are the final tabulae deduced from all Tycho's observa- tions, put in Kepler's tabulae as "Orbi" of, or a reformulation of Gassendi, in Danish, translated into German by Weistrias, Leipzig, 1756. Tycho Brahe printed his works at his own press of Uraniborg, so long as he remained there, and probably distributed them principally in presents. When they were dispersed, the booksellers varied the title-pages, and hence all the confusion of the preceding list. We sup- pose those marked (F) were put together after the Frankfort reprint (K), to look like them, if indeed that be a reprint.

The family of Brahe was originally Swedish, but Tycho, the eldest son of the family, was born at Hvalsongs in Denmark in 1546. His father had ten children, of whom the last, Sophia Brahe, was known in her day as a Latin poetess, and was also a mathematician and astronomer. This family was as noble and as ignorant as sixteen undisputed quarters could make them; but Steno, the maternal uncle of Tycho, volunteered to take charge of him. Perceiving that he had talent, his uncle employed masters to teach him Latin, much against the will of his father, who intended him to do nothing but bear arms. In 1569 Tycho was sent to the University of Copenhagen, but continuation of his astronomical work continued the pretensions of the astronomers, and by the total eclipse of the sun, August 21, 1569. He began to study the doctrine of the sphere, and the epemerides of Stadius. In 1566 his uncle, who intended him for the law, sent him to Leipzig, but he returned with a fortune; he was so placed by this means as not just enough to save appearances; he disliked the study, and made a pungent epigram on it as follows:

"In quae palatia et legum sunt nominis juris sub uno,\nHinc solum quod in astrologia laetus est,\nIne."

In the meanwhile he spent his time and money on astrono- mical instruments; and, while his tutor slept, used to watch the constellations by aid of a small globe not bigger than his fist. With these slender means he was able to see that both the Alphonsine and Prutenic tables gave the places of the planets with such accuracy, and that the stars were fixed. He made a projected conjunction of Saturn and Jupiter in 1563. He took strongly into his head the correction of these tables, and his first instrument was a pair of common compasses, which he used as an instrument for observing the angles of the stars.

By this time his uncle had left him in possession of the leg of the compasses, and laying down angles upon it, he was able to find the Alphonsine tables more than a month in error, and the Prutenic several days. He procured a better instrument, and corrected the deficiencies of its graduation with great accuracy, and this instrument was the astronomicale rule, or ra- dius, in the manner of Gemma Frisius.

He was recalled in 1565, by the death of an uncle, and soon became disgusted with the contempt with which his work was received; in 1567, he returned to Copenhagen, and his uncle Steno, however, recommended him to follow his fa- vorite pursuit, and he left his country once more, and took up his residence at Wittenberg in 1566, from whence he was driven to Rostock in the autumn by the plague. While he was at Rostock he met with a Danish nobleman, a Dane of family like himself, at a public festival. The affair was decided by single combat, and Tycho lost all the front part of his nose. A contemporary, cited by Gassendi, hints that they took this method of settling which was the better mathematician of the two. Tycho always afterwards wore an artificial nose made of gold, but so well formed and coloured as to be hardly distinguishable from the one with which he began life; and he always carried a small box of ointment, with which to anoint this artificial member.

In 1567 Tycho received a letter from Augustus, then prince of Saxony, inviting him to the place, and finding astronomers there, he determined to remain. He here became, as he was, a man of science, as well as of letters, and was capable of furnishing an answer to any question put to him. He wrote on a variety of subjects; in particular, he wrote a treatise on astronomy—what correctness we have seen. Returning from his laboratory on the evening of November 11, 1572, he cast his eyes on the constellation Cassiopeia, and was thunderstruck by there perceiving not only a new star but one of greater splendour than any in that constel- lation. The country people also saw it, and he imme- diately set himself to determine its place and motion, if any. Happening to visit Copenhagen early in the year 1573, he carried with him his journal, and found that the servants of the university were not yet struck with the phenomenon. He excited great derision at a convivial party by mention- ing his discovery, which however was changed into astonish- ment on his actually showing them the star. They there- after became so urgent that he should publish his notes, which he refused, being, as he afterwards confessed, under the prejudice that it was unbecoming for a nobleman to publish anything; but afterwards, seeing how many and worthless were the writings on the same subject, and biding his time by his friend at Copenhagen, he sent his account, with additions, to one of them for publication. The star itself continued visible, though gradually diminishing in brightness, till March, 1574. It was at one time as bright as Venus. Cassiopeia.

As soon as this star had conquered his aristocratic aversion to being useful, he committed a much more serious offence against his order by marrying, in 1573, a peasant, or at
least a plebeian, girl of Knudstorp, named Christiana; some say she was the daughter of a clergyman. By the interposition of the king the fury of his family at this step was cooled. Never was man's prejudices subjected to a more salutary course of discipline than those of Tycho Brahe. In two short years the proud noble became an author, a lecturer, and the husband of a woman of inferior rank. The students of the university desired to profit by his knowledge, and on his positive refusal, the king, to whom he felt his obligations, made it his own earnest request. No choice was therefore left to the unfortunate recusant; and he accordingly delivered the public lecture marked (E) in our preceding list, which, putting aside the astrology, is a sensible discourse; and, excepting a hint at the beginning that nothing but the request of the king and of the audience (for politeness' sake) had made him undertake an office for which he was so unfit by station and mediocrity of talent (for modesty's sake), does not contain any allusion to the bands of degradation. He informs his audience at the end that he intends to lecture on the Ptolemaic tables, and he did so accordingly. This lecture was first published in 1610 by Conrad Aslaus (we cannot unlistine Gassendi's name), who got it from Tycho himself.

Tycho Brahe had all this time intended to travel again. He set out in 1575, leaving his wife and infant daughter at home, and proceeded to the court of the Landgrave William of Hesse-Cassel, who was himself a persevering observer; so much so, that when, during an observation of the new star of 1572, servants ran to tell him the house was on fire, he would not stir till he had finished. On leaving his court, Tycho wandered through Switzerland and Germany, apparently seeking where he might best set up his observatory, and he had fixed his thoughts upon Basle. But in the meanwhile ambassadors had been sent from Denmark to the Landgrave of Hesse-Cassel, and that prince took occasion warmly to recommend Tycho Brahe and his studies to the notice of his own sovereign. The latter (Frederic II.) accordingly sent for Tycho after his return to Knudstorp in 1576, and offered him possession for life of the island of Hven or Holme, taking upon himself all the expenses of his settlement. The offer was gladly accepted, and the first stone of the astronomical castle called Uraniborg or Gravensborg (the city of the heavens) was laid August 13, 1576. There is a full description of it in Gassendi, as also in (D) and (E). The following drawing is extracted from the former. It is necessary to warn our readers that the clumsiness of the old wood cut is purposely imitated, owing to some critical remarks we have heard on the figures in Astrolabe (which see for the character of the instruments employed).

Besides this, there was an observatory sunk in the ground, and named Stellberg (city of the stars). These two buildings contained 28 instruments, all extrameridional, but distinguished, as appears in (E), by many new contrivances for avoiding error, and by a size and solidity which can hardly be attainable; though it may be doubted whether the instruments themselves were calculated to give so small a quantity (for that time) with certainty. Tycho's instruments are vaguely said to have cost 200,000 crowns; the king allowed 2400 dollars a year; besides a fief in Norway and a canonry in the church of Roskilde.

In 1577 he began his observations, and on November 13, 1577, saw the comet which is the subject of (B). This luminary, and others of the same kind, gave occasion to his discovery that the spheres of the planets [Primum Mobile, Ptolemaic System] could not be solid, since they were cut in all directions by the orbits of comets, which must be called the first decisive blow against the received notions. And Tycho was the first who proved comets to have such a parallax as was incompatible with their being atmospheric, or even subluminary, bodies. He observed altogether seven comets, the last in 1596.

It is not our intention to follow Tycho Brahe at length through his splendid career at Uraniborg. No space here accessible would suffice to detail his results sufficiently for astronomical reference. We must therefore content ourselves with a few words on the state in which he found and left astronomy. The reader may fill up various points from the article Astronomy.

* From the time of Ptolemy it may be said that astronomy had made some advances, but these did not certainly compensate the defects which time must introduce into tables of pure observation, unaided by any such knowledge of the system as will make accurate predictions possible. If the

* In reference to that article, the reader of course must be aware that so large a number of facts and dates could not be taken from original authorities, but only from histories of reputation, and it cannot be more correct than the latter. Of the loose way of speaking with regard to dates, we have there complained; and there is an instance in Tycho Brahe where it is said he began to observe a comet in 1576, which he did not observe. He did in that year begin the regular observation of stars and planets (Mars particularly) which led to the Rudolphine tables; but he had been observing (though not with finished means or methods) from 1577.
Arabs did some good by their observations, they did nearly as much mischief by their theories; and the Alphonsine table proved that the astronomer of that time knew their heavens as well as Ptolemy did his. It was impossible for any one to make a considerable advance with such instruments as Tycho Brahe actually found in use, or without rejecting all theories of the heavenly bodies then in vogue. He therefore left all these entirely out of his book. The result of a theory is its accordance with nature; those of the time in question were so defective that their falsehood might be perceived by merely a little globe large enough to be held in one hand. Those who were engaged in the study of astronomy at the time of Tycho Brahe that he was the first who did see it. But he did more than this: he saw also the means of remedying the evil, by his mechanical knowledge in the construction of instruments, his perception of the way in which those who should use them might be guided. The result of his labours was, that he did see it. He showed himself a sound mathematician in his methods for determining refraction, in his deduction of the variation and annual equation of the moon, and in many other ways. He proved himself to be at the same time a great observer and a great astronomer; and when we consider how good fortune seems to have made a result of more importance than the discoverer had any right to presume, either from the skill or labour employed in obtaining it: but in the case of Tycho Brahe we believe we are joined by the greatest authority in thinking that he has an apparent diameter of a second. Undoubtedly, what would you have answered then, is the reply. The stars were spheres of visible magnitude, and are so still; nobody can deny it who looks at the heavens without a telescope. Tycho Brahe, in the truest sense of the word, was an instrument, and a fact which could only be known by an instrument invented after his death.

Again, the mechanical difficulties attending the earth's motion were without any answer which deserved attention except in the case of Copernicus. The problem was that of uncertainty, uncertainty, uncertainty, and the sagacity he displayed in combining his materials. Where Hipparchus and Ptolemy have left gaps in which good fortune seems to have made a result of more importance than the discoverer had any right to presume, either from the skill or labour employed in obtaining it: but in the case of Tycho Brahe we believe we are joined by the greatest authority in thinking that he has an apparent diameter of a second. Undoubtedly, what would you have answered then, is the reply. The stars were spheres of visible magnitude, and are so still; nobody can deny it who looks at the heavens without a telescope. Tycho Brahe, in the truest sense of the word, was an instrument, and a fact which could only be known by an instrument invented after his death.

Frederick II. died in 1588, and Tycho remained un molested under his son Christian IV. till 1596. Gassendi relates that the nobles were envious when they saw farewell to his exactions. They were, however, applied to the emperor with Tycho: that the medical men were displeased at his dispensing medicines gratis to the poor; and that the minister had a quarrel with Tycho about a dog. Malte-Brun relates this more distinctly, apparently from the Donzel de la Hœre of Bonhong's History of Denmark, so that it seems most probable that the destruction of the observatory at Hœre arose from a personal squabble between this minister, called Weikendorff, and a dog of Tycho, whose name has not reached us. The astronomer was gradually deprived of his different appointments, and in 1596 removed, with all his smaller apparatus, to Copenhagen. A commission, appointed by the minister, had declared his methods not worth prosecuting, and his instruments were all removed to the castle.

In the summer of 1597 he finally left his country, and removed with his wife, two sons, and four daughters, to Rostock, from whence he shortly removed to Wandbeck, near Hamburg, at the invitation of Count Rantzau. At the end of the second year of his stay in the imperial dominions, the Emperor Rudolph II., promising him every assistance if he would remove with all his apparatus to the imperial dominions. Thither Tycho arrived in the spring of 1599, having been detained during the winter at Wittenberg, by the circumstance of a contagious disorder raging in Prague. The emperor settled upon him a pension of 3000 ducats, and offered him the choice of three different residences. The celebrated Kepler joined him in February, 1600. Tycho had repeatedly written to invite him, having first entered into communication with him in 1598, when he sent Tycho a copy of his Mysterium Cosmographicum. The latter advised him to lay aside speculations, and apply himself to the deduction of causes from phenomena. It is to follow his own dictum, not to begin with the end in view, but to trace the structure of the heavens from the facts. Tycho not only furnished him with the observations necessary, but was his adviser (and never was adviser more wanted) in the way of using them. In the year 1601, they were employed together in the composition of tables from the Uraniborg observations, which tables they agreed should be called Rudolphine. But on the 13th of October, 1610, the effects of a convivial party, combined with inattention to himself, produced a mortification of the bladder. He continued for many days in pain, and died on the 24th of the month, in the 57th year of his age. He left a.note frustra visisse videor,’ which must be interpreted as something between a hope and a declaration, that he had not lived in vain. Nor will he be thought to have done so by any one who ever found his longitude at sea, or slept in quiet while a comet was in the heavens, or his view of the future fortune of the one supposed minister of God’s anger. For if the list of illustrious men be formed, to whom we owe such benefit, it will be found that his observations form the first great step of the moderns in astronomy. There was a report set abroad in Denmark that Kepler had died in his own bed, and that his last words were addressed to God, doubtless the imagination of those who had driven him from his country. He was buried at Prague, and his monument still exists there. (Malte-Brun.) He was of moderate stature, and latterly rather corpulent, of florid complexion and light blue-green eyes. He was subject to indigestion; he worked in his own study, in testimony of the skill with which the wound already mentioned was repaired; and certainly, with the exception of a very great fullness and cylindrical figure of about the lower part of the nostrils, there is nothing there to excuse Rudolphine’s assertion that he was the pupil of his own master, and latterly renounced it altogether. He has left no record of his chemical and medical studies. He was a copious writer of Latin verses. The following, which are a fair specimen, are part of those written by him upon one of his instruments which has been preserved at Copenhagen. They show how highly he admired his patron.

Quid non ingenium superum sunt mentibus olim
Incensum montibus certum, Pelion, Ossa,
Innumerique sili, sed dum pombeae Gigantes,
Corpora praevia, et motus animae inscripte
In superes penetrare domus. Illa inclyta, illa
Vibina ingenio confusa, robore mulo,
Fuisse hactenus coluntur superem Olympum,
O tanti monumenta viri! Sint lignae quasvix
In silvis nostri parvis, atque si nuncem,
Secretam semper esse signum memorem.

Some of his earlier observations are preserved at Copenhagen. For the present state of Uraniborg, see Hoëns.

It is our belief that the merits of Tycho have been underrated, both as an inventor of instruments, and as a philosopher. As an observer, his works have spoken for themselves. The discovery of the proper motion of a comet, and the development of the theory of the fixed stars, are his. The t. is defended by a strong citadel which commands the rivers below it, is the seat of a pasha of three tails as its commandant, possesses a pop. of about 30,000, has a valuable sturgeon fishery, and exports great quantities of Wallachian corn to Constantinople. S. Hall places it in 45° 15' N. lat., 27° 54' E. long.

BRAIMA, a Sanscrit word, the name of the Supreme Being in the religious system of the Hindus. The primitive meaning of the word is not quite clear; it is evidently connected with the Sanskrit bhuta, whence bhūt, ‘great’; and has been explained by some as properly implying ‘the widely expanded Being.’ The crude form of the word, or the name in its unaffected state, is Brahma, and it is of great importance well to distinguish a two-fold use of that term, according as it is deemed as a substantive of the neuter or of the masculine gender.

When inflicted as a substantive of the neuter gender, its termination in the nominative case is a short o, Brahna (sometimes written Brahme or Brah in English works on Hindu mythology), and thus declined it designates the essence of the Supreme Being in the abstract, devoid of personal individuality. When treated as a masculine word, it is long o, Brahman, and has been translated a long time. ‘Kusha’ is also a Sanscrit word, the most ancient modification, becomes the name of the first of the three gods who constitute the triad of principal Hindu deities.

Brahmā, the impersonal divine substance, is with the Hindus not an object of worship, but merely of devout contemplation. According to the Vedanta system of philosophy, which recognizes the ancient sacred writings of the Hindus as the authority of the doctrines which it advances, Brahmas is the great source from which the visible universe and all the individual deities of mythology have sprung. He is the ultimate principle of all being, and undergoes no changes, as the human soul, according to the same authority, is a portion of the supreme ruler, as a spark in the fire. The relation is not as that of master and servant, ruler and ruled, but as that of whole and part.’ It is the same as Brahma, and denotes the ultimate re-absorption in the divine essence, is variously described in divers texts of the Védas. ‘But he who has attained the true knowledge of God does not pass through the same stages of development, being associated directly with the Supreme Being, with which he is identified, as a river, at its confluence with the sea, merges therein altogether. His vital faculties and the elements of which his body consists are absorbed absolutely and completely; both name and form are lost, and he becomes one with the Supreme parts or members.’ (Passages from the Brähmadeśasân, or aphorisms on the Vedánta doctrine, by Bâddarâyana; translated by Mr. Colebrooke; Transact. of the Roy. Asiatic Soc., vol. ii. passim.)

Brahmā, as an individual deity in mythology, is the creative operator of the universe; forming, with Vishnu (the preserver or sustainer) and Siva (the destroyer), the triad of principal Hindu gods. His epithets, which have been collected by ancient Sanscrit lexicographers, are numerous; some of the most important are: ‘Mahābrahma,’ the great; Paramābhir, ‘who abides in the most exalted place;’ Pāṭamābhir, ‘the great father;’ Pājapātī, ‘the lord of the creatures;’ Lōkeśa, ‘the ruler of the world;’ Dātātī, ‘the creator.’ In the mythological poems and in sculpture he is generally represented with four arms, holding in one hand a lotus, and in the other sometimes an axe. (Transact. of the Lit. Soc. of Bombay, vol. i. pp. 228-229, &c.) Exclusive worshipers of Brahmah and temples dedicated to his name do not now seem to occur in any part of India: homage is however paid to him along with other deities. The Brahmans, in their public oratorical style, always begin a prayer addressed to Brahmas, and at noon likewise they go through certain ceremonies in his honour: on the occasion of burnt offerings, an oblation of clarified butter is made to him, but it does not appear that bloody sacrifices are ever offered to Brahmas. At the full moon of the month Magha (January-February), an earthen image of Brahmas, with that of Siva on his right hand and that of Vishnu on his left hand, is worshipped; and dances, accompanied with songs and music, are performed as at the other Hindu festivals. The Brahmans, with the Brahmās, have long been the bearers of the double life. ‘Kusha’ is also a Sanscrit word, the most ancient modification, becomes the name of the first of the three gods who constitute the triad of principal Hindu deities.
maver. That near Bham, is still an object of adoration there. On the full moon of Agharshaya (November-December), a numerously attended fair is annually held there in honour of Brahmā. (Wilson, in the Asiatic Res., vol. xvi. p. 14, 15; Ward, View of the Hindoos, &c., 2d edit., vol. ii. p. 29, 30.)

BHARMAINS. [HINDUS, CASTES OF].

BHARAMPOOTA, one of the largest rivs. of Asia, and in many respects one of the most remarkable on the globe. Sixty or seventy years ago this riv was almost unknown to Europeans; though they had information about its neighbourhood at least three centuries before the date of our recording.

The farthest branches of this riv, which has a common embouchure with the principal branch of the Ganges, rise between 97° and 98° E. long., and between 26° and 29° N. lat. Here, about 30° N. lat, stands a snow-capped mountain range, which in the present state of our geographical knowledge must be considered the most easterly portion of the Himalaya range: the Taluks, the most N. of the sources of the Brahmapoota, has its origin in these mountains. No European has yet seen its source; but Wilcox was informed that it runs to the S.S.W. in a narrow valley between high, steep, and mostly barren rocks, till it joins the Taluding, a riv. not inferior in size, which descends from the mountains of Namhio (28° N. lat.), a ridge belonging to the Botchedale District, which has divided the farthest branches of the Brahmapoota from those of the Irawaddy. After the junction of the Taluks and Taluding the river continues its course to the S.S.W. between high mountains, and about 29° south is the most E. point; or rather, the lower portions of the Brumpee mountains are covered with jungle, with now and then an intermixture of grass in spots. The riv. is full of foam, and the rocks in its bed are of such enormous size, that it is hardly possible to conceive that they have been brought down by the fire. In the rainy season, the greatest variety shows that they are not in situ. Sentic granite, in which gneisses are found 7-10ths of an inch in diameter, serpentine of a flinty hardness, and primitive limestones are most numerous.

At this place the riv. changes its direction, flowing for some miles to the N.W. between high mountains and in a narrow valley; it then turns to the S., and a few miles lower down it issues from the mountains by a narrow pass, called Prabhu Kuthar, in which the riv. is about 200 ft. wide, and runs with great violence. Near this pass, on the S. banks of the riv. is the Brumaskoond (the source of the Brahmapoota) or Deo Pani, a place of pilgrimage among the Hindus. It is nothing but a good sized pool, 70 ft. long by 30 wide, enclosed by high projecting rocks, from which two or three small rivulets flow into the river from the side; the riv. has obtained its sacred name of Brahmapoota, the 'offspring of Brahmā,' though it is commonly called by the natives Lohit, or Lohiyya (Laughiya in Sansc., the red river).

After passing the Prabhu Kuthar the Lohit enters the valley of Upper Assam or Sadiya, where the hills retire to a distance of 30 or 35 m. from each bank. But though carrying a great volume of water, the Lohit becomes navigable for large boats only at Sonpara, 12 m. above Sadiya. In this district the river does not increase in size, but the torrents descending from the hills bring down in the rainy season an immense and yearly accumulating collection of boulders and round pebbles of every size, which blocking up the river divide it into numerous channels, and produce frequent rapidin of shoals. These circumstances render its navigation extremely difficult and nearly impossible. In this tract the Lohit begins to display its character of dividing its stream and forming large longitudinal islands, a peculiarity which is frequently observed in its course through Assam. Near 26° 15' E. long., and 27° 51' 21" N. lat., the riv. divides into two branches, of which the N. and larger is called the Lohit or Buri Lohit, and the S. Sukato: these branches unite again about 10 or 12 m. farther downward. The island thus formed is about 4 m. wide.

From the Prabhu Kuthar to Sonpara the riv. runs nearly W., and in this tract its waters are only increased by small streams. But between Sonpara and Sadiya, where it passes to the S., the Lohit is joined by the N. of the Brahmapoota, a considerable riv., whose upper branches rise above a hundred miles from its mouth. The best known is the Dupsa Pani, which originates on the W. declivity of the mountains, over which the Phungun Bum pass (27° 32' N. lat.) leads to the country on the banks of the Irawaddy, and attains a height of 11,000 ft. Hence the Dupsa Pani flows between mountains in wild rapids to the E. and unites with the other branch, called the Noa Dihing or New Lohit. Neither course of the river is known, but it would appear that its source is farther from the place of junction than that of the Dupsa Pani, and on the S. declivities of the Lekang Mountains. From Lohi towards the Noa Dihing is navigable for small boats. The river Meiners, which joins the Lohit nearly midway between the Dihing and the Loht, flows in a S.W. direction, and forms numerous islands, so that hardly in any place does the whole volume of its waters run in one bed. Here it receives on the S. the Buri Dihing, a considerable riv., whose origin is near the banks of the Noa Dihing, and separated from it by such low grounds, that at certain times of the year a piece of water joins the Dihing river flows to the Buri Dihing and constitutes as it were its source, which has given rise to the opinion that the Noa Dihing at some remote period did not discharge its waters into the place where it now empties itself in the Lohit, but constituted the upper branches of the Buri Dihing. The Buri Dihing runs nearly in a due western direction, probably above 120 m., but its upper course is not known.

A few miles below this junction, the Lohit divides into two large branches, the northern of which is called Buri Lohit, and the southern Buri Dihing; as it was the continuation of the large affluent which joined it a few miles farther up. These branches include the fertile island of Majuli, which extends from 94° 30' to 95° 30' E. long., about 50 m. in length, with an average breadth of 9 m. Opposite this island the Lohit or Buri Lohit is the larger riv., the river not inferior in volume of water to any of the tributaries of the Brahmapoota, excepting the Dihing. It has not been examined to any great distance from its mouth, but the statements of English navigators suggested to Wilcox the idea that it may be the lower course of the Mon-tai, a large river of Tibet; an opinion which is very probable.

Into the southern branch of the Brahmapoota, or the Buri Dihing, falls the small river Dikho, on which the present capital of Assam, Jorhat, is situated, and lower down the river, the town of Geurar, on the banks of which rises at a great distance to the S. in the territories of the Raaj of Moonipore, in a country not yet explored by Europeans.

After the Buri Lohit and the Buri Dihing have reunited and flowed down for nearly 30 m. in one channel, divided only at a few places by small islands, the Brahmapoota divides at the town of Bishenath (29° 15' E. long.) into two large branches, of which the northern and larger is called the Noa Lohit, and the southern is called Kullung or Kolung. The upper branches of the Brahmapoota extends in length upwards of 75 m., with a width of 20 or 25 m. in the middle. As European travellers do not mention the native name of this riv., and Egermann, in his map of the island of Kullung, the Kullung branch of the Brahmapoota is a much mentioned river, the Deyong, whose sources are situated far to the S. in the kingdom of Katkar, and which breaks through the chain of the Naga Mountains, like the Dhuensi.

The Kullung branch of the Brahmapoota runs along the coast of Tibet; an opinion which is very probable.
the extensive valley of Assam may be considered as terminated; for here the offsets of the Himalaya range on the N. and the Garh Hills on the S. approach the river within a short distance, and in many places leave but a narrow tract above which the Brahmapoona runs out of its course, an undivided stream, and is hardly 1200 yards wide, which is its smallest breadth after its junction with the Dihong. Its stream is so exceedingly rapid, that in the rainy season vessels are obliged to wait for a strong westerly wind, to enable them to stem the current. In the early course of the river, near Goylpara, the Brahmapoona enters the plains of Bengal, where it is only about 120 ft. above the level of the sea.

The general direction of the Brahmapoona from the western extremity of the island of Kullung to its entry into the plains of Bengal lies E. & S.E., and the direction of Goylpara presents this direction still farther down to the town of Rangamattty. Below Goylpara it receives on the N. the Bonsaali or Manas, a considerable river which traverses the eastern portion of Botan, but whose course is nearly unknown, except so far as it runs through the plains of Bengal.

Near Rangamattty the Brahmapoona declines to the S.W., and shortly afterwards takes a due southern course to 25° N, lat., where it begins to run to the S.E. Between 26° and 23° the first communication with the Ganges commences. A small branch of the Brahmapoona running due S. falls into the Isamutty, a branch of the river, which joins the Ganges near Jaffergunge, and another water-course, which branches off from the Brahmapoona a little farther down, and is called Lombe, falls into the ancient bed of the river, which, after meandering, comes to the river of the same name. The Brahmapoona continues its south-eastern course nearly to 24° N. lat., where it is joined by the Barak or river of Sihel. This latter river has its still unknown origin in the mountains of Tipereb, and enters the kingdom of Kutch by a rapid fall. It then turns suddenly to the W. and continues in this direction through the prov. of Sihel; but E. of 92° E. long., it branches off in different channels, of which the southern and most considerable runs W.S.W., and falls into the Brahmapoona near the point of its junction with the Ganges, and is cut off from the river by morasses between Jaffergunge and Nagaon. To Pootyah and Banlesub. At present both rivers have separate embouchures, though they approach so near one another that their beds at some places are hardly two miles apart. Even after the two rivers have mingled, they are divided, that of the Ganges running to the W. of the island of Shabazmore, while the Brahmapoona sends its waters to the gulf of Bengal by the channel between the islands of Shabazmore and Hatta.

The whole course of the Brahmapoona, as here described, may be estimated at 860 m. of which 160 m. belong to its upper course E. of the mouth of the Dihong, 350 m. to its middle course to Goylpara, and the remainder to its lower course to the island of Hatta. The Ganges runs 1350 m., and the Brahmapoona 1600 m., on the S. course near Dihong, to which W nel calculated that at the main branch of the Ganges discharges only 80,000 cubic ft. This fact is a strong reason in support of the Dihong being the river which in Tibet is known by the name of Sampo; but others are of the opinion that the Sampo joins the Iravaddy.

At the time of D'Anville the Brahmapoona was hardly known further than by name. He therefore inserted it in his map of southern Asia as a small river running N. and S., nearly in the place where at present the Gadadar or Toor river runs. I believe the opinion of the Chinese geographers, that the Brahmapoona is a branch of the Ganges, and discharges only 80,000 cubic ft. To this it is said that at the mouth of the river, it does not join the Kinclie-kiang or Yantsie-kiang. He therefore conjectured that this river must join one of the large rivers of the peninsula without the Ganges, and he hit on the largest, the Iravaddy. When Rennell surveyed the lower course of the Brahmapoona in 1793, he was struck by its magnitude, and he collected some information respecting its source, which the Chinese geographers place in the Sampoo of Tibet, that it was the source of the Dihong, that the Sampoo of Tibet discharged its waters by this channel. The conjecture was confirmed by the information obtained by Turner at Tessebo Loombo. Rennell inserted this river in the first edition of his map of Hindostan, where with great ingenuity he hit near on the same place where the present the Dihong is found to break through the Himalaya mountains. This representation of the union of the Sampo and Brahmapoona was not questioned till 1824, when the British troops entered Assam, and it was discovered that the source of the river was not what was supposed, but was quite different. The difficult passage between the two rivers was performed by a passage through a narrow gully, the present state of which is shown on Rennell's map of the Sampo entering the vale of Assam. Lachlan and Julius Klaproth accordingly conjectured that the Sampo runs much farther to the E., and, encircling the mountains at the sources of the Brahmapoona, joins the Iravaddy. Klaproth, who had carefully examined the Chinese geographers, collected some passages which he thought sufficient to support his opinion. But the British officers, who remained in Assam, and especially Capt. Bedford and Lieut. Wilcox, ascertained that the Sampo was a very large river. Their attempts to ascend it were frustrated partly by the nature of the river within the mountains, where it comes down in a succession of rapids and cataracts, and partly by the mountainous. But Wilcox succeeded in passing the sources of the Sampo by a direct route from the Brahmapoona and those of the Iravaddy, and he found that in the country of the Bor Khamtia the Iravaddy is an inconsiderable river, only 80 yards wide, and the natives were not acquainted with any large river in the neighborhood. The Sampo of Tibet does not join the Iravaddy, or any other river in the adjacent countries.

On the other hand, as far as the course of the Sampo as well as of the Dihong has been fixed by astronomical observations, the Brahmapoona runs in the same river. The only point which has been determined on the banks of the Sampo, by actual observation, is Tessebo Loombo, which Turner found at 89° 7' E. long. Farther down, the position of H Lassa, which lies at no great distance from the Sampo on its northern bank, has been calculated by Gaubil to be 88° 4' E. long., of Paris, or 99° 24' of Greenwich. Below H Lassa the Sampo continues its course for a considerable distance to the E., until all information of its farther course is lost. The Dihong issues from the mountains and on the 19th of Nov. 1793 passes the point of H Lassa, and, in the same manner that the Sampo is lost, the Dihong is lost. Between H Lassa and this point there are still five degrees and six minutes for the known and unknown portion of the course of the river.

It is impossible to draw any conclusion from the difference of lat. between the two rivers, and from the description of S. In D'Anville's map De Haide's description of China the known course of the Sampo terminates at 26° 40' N. lat., and on the Chinese map of Kienlong in 27° 30', and consequently to the S. of the valley of the Brahmapoona: Klaproth accordingly, to support his opinion, has been obliged to place it at 28° 30', and Berghaus even at 29° 13' N. lat. But if we even admit the lat. of Klaproth, the distance of the termination of the known portion of the Sampo would only differ 24 minutes of lat. from the most northern point on the Dihong, to which Wilcox ascended this river (28° 6' N. lat.).

Klaproth supports his opinion of the identity of the Sampo and Iravaddy, by a few passages from Chinese geographers; but it is evident that all the countries which lie between the Himalayas and the Ganges, the Sampo and China Proper were and still are as little known to them as to us; and as they had no knowledge at all of the Lohtib and the vale of Assam, they thought it necessary to unite the Sampo with the most considerable river in the neighborhood of Tibet. To the passages of the Chinese geographer may be opposed the decided opinion of the lamas of Tibet, who told Turner that the Sampo running to the S. unites its waters with the river flowing down from the Brahmapoond.

The whole passage of the Brahmapoona is probably more remarkable than that of the Dihong; but it might have been what the Chinese geographers supposed, if it had been the continuation of the Sampoo. By adding this riv. the course of the Brahmapoona is increased by upwards of 1000 miles: this circumstance would sufficiently explain

---

No. 313. [THE PENNY CYCLOPEDIA.] Vol. V. 341
why this riv. brings down a volume of water, which raises it far above the Ganges and Irawaddy, and claims for it the first place among the rivers of S. Asia. (Renell; Francis Hamilton; Klaproth’s Mémoires; Nefville and Wilcox in Asiatic Researches; Ritter, Asiam; Maps of Klaproth, Bingham.)

Brahmegupta. (Viga Ganita.)

BRAIDWOOD, THOMAS, is known as one of the earliest teachers of the deaf and dumb in this island. He began this useful career at Edinburgh in 1766. No authentic record of the methods which he pursued had been made known, unless a work published by the late Dr. Watson, formerly the head master of the London Institution for the Deaf and Dumb, may be so considered. Dr. Watson, as an assistant to Mr. Braidwood, acquired his first practical experience of the method which was founded upon the same principles; and his indefatigable industry and great success would claim from me respectful notice, even if I could forget the ties of blood and of friendship (Instruction of the Deaf and Dumb, Introduction, p. xxiii, London, 1809). A work entitled Vox Orula Subjicta, published at London in 1783, the production of an American gentleman, whose son was educated by Braidwood, professes to give ‘a particular account of the academy of Messrs. Braidwood, of Edinburgh; but it throws no light on the system of instruction used by these gentlemen. It is chiefly valuable for its copious extracts from the writings of Bulwer, Holder, Amman, Wallis, and Lord Monboddo, who had all considered the subject of speech with philosophical attention, and in relation to those peculiarities in the mind, or who had discussed the language, and who consequently labour under the deprivation of speech. There was doubtless much merit in the mechanical methods used by Braidwood and his son to produce in their pupils an artificial articulation, and in the persevering application which had been made of them. Braidwood succeeded in attracting the notice of many eminent persons. He is spoken of with praise by Arnot (Hist. of Edinburgh), Dr. Johnson (Tour to the Hebrides), Lord Monboddo (Origin and Progress of Language), Pennant (Tour to the Hebrides), and Johnson (Dictionary and Speech). In addition to these, Lord Morton, president of the Royal Society, Lord Hailes, Dr. Robertson, Sir John Pringle, Dr. Franklin, Dr. Hunter, and others attended the public examinations of his pupils, and attested their progress. After having resided some years at Edinburgh, Braidwood removed his establishment to Hackney, near London, where he continued to instruct the deaf and dumb, and to relieve impediments in the speech, till his death in 1806.

Brain, a soft and pulpy organ, which in man occupies the cavity of the cranium, and forms one of the central masses of the nervous system [Nervous System]. In man and all the higher animals the nervous system consists of four distinct parts—the white threads called nerves; known as the nervous matter; the cavity of the cranial bone called ganglia; a long cord of nervous matter filling the cavity of the vertebral or spinal column, called the spinal cord; and a large mass of nervous matter generally considered as a continuation and expansion of the spinal cord, called the brain. The spinal cord and brain constitute the two central masses of the nervous system, that is, the immediate seat of the functions peculiar to this system.

The general mass of nervous matter designated under the name of the brain, together with its membraneous coverings, vessels, and nerves, completely fills the cavity of the skull. This mass is divided into three parts, the cerebrum or brain proper, which occupies the whole of the superior part of the cavity of the cranium; the cerebellum, much smaller than the cerebrum, which lies above it, called the dura mater, which occupies the lower and back part of the cavity of the cranium; and the medulla oblongata, by much the smallest portion of the mass, situated at the basis of the cavity, between the cerebrum and cerebellum. The medulla oblongata is the cavity of the cranium filled with the vertebral canal by the foramen magnum of the occipital bone, being continuous with and forming the commencement of the spinal cord.

This general nervous mass is closely enveloped in three distinct membraneous coverings, two of which have been called dura mater, from the fanciful notion that they give rise to all the other membranes of the body. The external covering termed dura mater, from its being of a firmer texture than the other two membranes, encloses the brain with all its appendages, and lines the whole internal surface of the bones of the cranium. It is of a fibrous texture, the component fibres interlacing each other in every possible direction, and forming a firm and dense membrane, composed of the thickest and strongest membrane of the whole body. By its external surface the dura mater adheres everywhere to the inner surface of the cranium, just as the peristeum adheres to other bones. When torn from the cranium this surface appears: a mass, and irregularly spotted with bloody points, which are the laceraed orifices of vessels that pass between the membrane and the surrounding bones. These vessels are much more numerous in the young than in the adult, and are most abundant at the extremities of the cranial bones, at the angles and in the region of the temporal antrum. The inner surface of the dura mater, which is shining and smooth, is lubricated and kept in a state of moisture by a fluid seceded by its own vessels. This membrane performs a twofold office; it supplies the place of the periostracum to the inner surface of the bones of the cranium, sustaining their nutrient vessels; and it serves as a defence to the brain, and a support to the different masses into which it is divided.

The dura mater gives off several elongations or productions called processes, which descend between certain portions of the brain; the most remarkable of which is termed the superior longitudinal process, which extends from the front to the back part of the skull, between the lateral halves of the cranium. Narrow in front, it becomes gradually broader towards the back, and in its way is manufactured, by one of the genera of fibrous tissues, as it is received, some resemblance in shape to a sickle or scythe, whence the common name of it, falc cerebri.

Where the falk cerebri terminates behind, there proceeds a large lateral expansion of the same membrane, extending across the back part of the skull, and in a most beautiful manner, covering the inferior portions of the cerebrum, and forming a complete floor or vault over the cerebellum. This membraneous expansion is called tentorium, the obvious use of which is to prevent the cerebellum from pressing upon the cerebrum; while from the middle fossa passes the tentorium cerebelli, which descends between the lobes of the cerebellum and terminates insensibly at the edge of the foramen magnum, performing for the cerebellum the same office as the falx performs for the cerebrum: hence it is called falc cerebelli.

Moreover, the components of it, more especially in certain parts of its course, separate into layers, which are so disposed as to leave spaces between them, for the most part of a triangular form. These triangular spaces, which are commonly termed sinuses, are lined by a smooth membrane resembling closely the structure of the cerebral part of the brain, and form cavities between the various parts of the body, and these sinuses perform the office of veins, returning the blood from all the parts of the brain to the neck. Nothing analogous to this structure occurs in any other part of the venous system. In almost every other part of the body the venous sinuses are situated along the contour of the body, which is a most important aid to these vessels in enabling them to carry on the circulation of the blood; but in the brain, the venous tubes are guarded from pressure, the dense dura mater being for this purpose stretched so tensely over them that the weight of the surrounding parts is entirely taken off them.

One of the conditions essential to the performance of the functions of the brain, is that it be free from pressure. The brain is a soft substance, enclosed in a hard unyielding case. A preternatural accumulation of blood in its vessels would extend the brain along with its envelope, its substance cannot expand with any additional quantity of fluid that may be poured into it; consequently, such additional quantity of fluid would inevitably occasion a disturbance of function, if not organic injury.

The smooth surface of the brain which is exposed on the reflection of the dura mater, is formed by its second investiture, membrane, which is named the tunica arachnoidae, from the extreme tenderness and delicacy of its tissue, which give it a resemblance to a spider’s web. This thin and delicate membrane is thrown into a great number of convolutions over the surface of the brain, covering all the eminences termed convolutions (fig. 1, 2, 3), but not insinuating itself between any of the depressions between the convolutions (fig. 4, 5, 7). On account of its extreme tenuity and its close adhesion to the membrane beneath it, it cannot be entirely separated from the latter; but there are situations at the basis where the arachnoid membrane, as it passes between

---

The text appears to be a page from a book discussing the anatomy of the brain and related structures, focusing on the dura mater and its functions. It describes the structure and properties of the dura mater, its relation to the cranial bones, and its role in protecting the brain. The text also mentions the superior longitudinal process and the tentorium cerebelli, and discusses the significance of the sinuses and their role in the circulation of blood through the brain.
opposite parts of the brain, can be seen distinct from the subjacent tunic.

The third investing membrane, the pia mater, derives its name, like the former, from the tenderness and delicacy of its tissue; but unlike the tunica arachnidea, in which not a single blood vessel has hitherto been discovered, the pia mater is exceedingly vascular. The blood vessels with which every part of this delicate membrane is covered are the nutrient arteries of the brain; before they penetrate the brain these vessels divide, subdivide, and ramify to an extreme degree of minuteness upon the external surface of this membrane, so that the blood does not enter the tenuous cerebral substance with too great force. When a portion of the pia mater is greatly raised from the brain, these blood vessels appear as exceedingly fine delicate threads, which, on account of the elasticity with which they are endowed are capable of elongation as they are drawn out of the cerebral substance. As the pia mater contains and supports the nutrient vessels of the brain, this membrane is not only spread as a general envelop over its entire surface, but it penetrates between all its convolutions and lines every cavity which is formed in it.

It has been stated that the large portion of the cerebral mass, termed the cerebrum, occupies the whole of the upper part of the cavity of the cranium. The cerebrum is divided

![Diagram of the brain](image)

FIG. 11.

[Base of the brain.]

1. anterior lobes of the cerebrum; 2. middle lobes of the cerebrum; 3. posterior lobes of the cerebrum; 4. fissure separating the anterior from the middle lobes, named the fissura Sylvii; 5. situation of the superficial excavation forming the hemisphere over the middle and the posterior lobes; 6. the two hemispheres of the cerebrum composed of flattened laminae or layers; 7. the medulla oblongata, which in this position of the brain rests upon and covers the vermis firmament; 8. corpora pyramidalia; 9. corpora olivaria; 10. tuber cinereum or pons varolii; 11. demarcation of the corpora pyramidalia; a, b, c, d, cerebral nerves.

The whole of the external convex surface of the hemispheres is divided into numerous eminences termed convolutions, which run in different directions, and are of different sizes and lengths, in different parts of the hemisphere (fig. 11). The depressions or fissures between the convolutions termed clefts, or sulci, generally penetrate the consistence of the brain to the depth of about an inch or an inch and a half (fig. iv. 7). The greater number of these pursue a zigzag course, but some run longitudinally, others obliquely; some communicate with each other, while others terminate separately in the substance of the brain (fig. 11. 7).

The nervous matter constituting the cerebrum is composed of two distinct substances, which differ from each other materially both in their colour and consistence (fig. 11). The outer substance is sometimes termed cortex, from its being of a greyish brown colour; at other times cortical, from its surrounding the inner part of the brain, as the bark the inner parts of the tree; by some it is also called glandular, and by others secretion, from the supposition that its nature is that of a gland, and that it secretes a peculiar fluid. It is of a softer consistence than the inner part, and leaves by desiccation a smaller quantity of solid residuum. It is composed almost entirely of blood vessels connected and sustained by exceedingly fine cellular membrane. Its structure is uniform throughout, presenting no appearance whatever of a fibrous texture. It gives to the entire surface of the cerebrum an external covering, generally about the tenth of an inch in thickness (fig. iv. 7).

The inner substance, termed white matter (fig. iv. 7), is firmer in consistence and larger in quantity than grey matter; and when an incision is made into it, its surface is spotted with red points, the cut orifices of its vessels, which vary in number and size according as they may be more or less distended with blood. It is now universally agreed that this part of the brain is composed of fibres. When examined in its recent and most perfect state, especially after it has been artificially hardened and condensed by the action of heat or certain chemical substances, if it be carefully scraped with a blunt instrument, these fibres become perfectly distinct and are of considerable magnitude, with furrows between them, which for the most part are placed in such a direction as to converge towards the base of the brain (fig. iv. 6, 5, 4). The fibres do not merely unite, forming what are called commissures.
sures, but they actually cross each other and pass into the opposite sides of the body. This decussation of the medullary fibres has been demonstrated in the most satisfactory manner by Drs. Gall and Spurzheim.

It is now very generally admitted that the medullary substance of the brain is the true and proper nervous matter, or the nervous substance in its most perfect state; that the grey matter is entirely subservient to it, and is indispensable, if not to its generation, at least to its nutrition and support. Drs. Gall and Spurzheim indeed maintain that the sole use of the grey is to form or secrete the medullary matter; and this opinion they ground, first, on the fact, that whenever the medullary matter is obviously to be increased, it is invariably surrounded by a mass of grey matter, which incloses it as in a bed or nucleus; and, secondly, on this further fact, that in the course of the spinal cord, wherever it sends off nerves, masses of grey matter are always accumulated. Professor Tiedemann, who disputes the correctness of the opinion of these physiologists, on the ground that in the fetus the medullary is formed before that grey substance, thinks nevertheless that the use of the grey substance is to convey the arterial blood which may be necessary to support the energy of the perfect nervous matter.

It is not intended, in this article, to pursue further the dissection of the cerebrum in the mode usually adopted by anatomists, both because the description could not be followed unless the object were before the eye, while that description, if needed, can be easily obtained in the common anatomical books; and because however convenient such a mode of examining the organ may be for the purpose of ascertaining its healthy or diseased conditions, it affords no insight into its real structure.

The cerebellum is situated at the basis of the cerebrum, towards its posterior part (fig. 11. 6, 6). Its form is elliptical, its largest diameter extending transversely from one side to the other (fig. 11. 6). Like the cerebrum, it is divided into two lateral halves or hemispheres (fig. 11. 6), which are separated by the falx cerebelli. In the centre of its upper surface there is a distinct prominence termed the vermis, or a process that may be thought of as a suture, under which a central summit of tissue is united in the form of a small circle or sulci between the convolutions. The pia mater, bearing the nutrient arteries of the cerebellum, passes between every one of these fissures; while the arachnoid membrane is simply extended over them. If a vertical section be made through either hemisphere of the cerebellum, a thick mass of white substance is seen in the centre, which, as it divides into the several strata, presents an arboreal appearance commonly denominated the arbor vitae (fig. 11. 3). These strata diverge towards the circumference of the cerebellum, and are covered externally by grey substance (fig. 11. 3).

In front of the cerebellum is placed a large mass of nervous matter, forming a very considerable eminence, commonly termed the tuber annulare, or the pons varolii (fig. 11. 10). It is divided into two lateral surfaces by a middle groove (fig. 11. 10). It is joined to the cerebrum by two thick white cords named the crura cerebri, and to the cerebellum by two similar cords named the crura cerebelli. The crura cerebri are continued backwards into the tuber, and forwards to the under and middle part of each hemisphere of the cerebrum, in which they are lost. In like manner the crura cerebelli are continued backwards into the hemispheres of the cerebellum, in which they terminate. The whole of this is covered by a much denser mass which intervenes between the tuber annulare and the foramen magnum (fig. 11. 7): beyond the foramen magnum it takes the name of spinal cord. On the anterior surface of the medulla oblongata there are four eminences continuous to each other (fig. 11. 7). The two internal are named corpora pyramidalia, or the pyramids (fig. 11. 8), and the two internal the corpora olivaria (fig. 11. 9), or the olivary bodies.

If the membranes which invest the medulla oblongata are removed, the cerebellum and pons varolii will be seen to be covered with a deep suture, under which there will be discovered four or five bands of white substance ascending obliquely from one side of the medulla to the other (fig. 11. 11). These bands on each side decussate, some of them passing above and others below those of the other side. They are united in the mid-line (fig. 11. 11). These bands are named the decussating bands of the corpora pyramidalia, and their decussation is conceived to explain the phenomenon familiar to the physician and surgeon, that when injury is done to one side of the brain, the constant disturbance of function is manifested in the opposite side of the body.

Taken as a whole, the nervous mass constituting the brain is strictly symmetrical, that is, the different parts of which it is composed are so arranged, that if the organ be supposed to be divided into two lateral halves by a plane perpendicular to the median line, the right and left halves will be alike, and if placed on each side of this plane have a perfect correspondence with each other, and form in fact reduplications of each other (fig. 11. 11). The principal parts of the cerebral mass are thus double, but they are all united on the median line with their fellows of the opposite side. This union is effected by medullary bands of various sizes, and figures which pass from one to the other, called commissures. Thus the double parts of the cerebral mass are united by means of the large mass of cerebral matter already spoken of under the name of the corpora callosa and of the hemispheres of the cerebrum. These hemispheres are united chiefly by a broad expansion of medullary matter, which extends transversely from the bottom of one hemisphere to that of the opposite side, called the corpus callosum, or the great commissure of the brain (fig. 11. 6, 6). There are other arcuate or meeting bands of smaller size, by which minor portions of the cerebral mass are placed in communication, into a description of which it is not necessary to enter here.

The cerebral parts are separated from one another at certain points by partitions or layers (fig. 11. 6), separated by fissures which are termed ventricles. Of these ventricles there are commonly enumerated four, all of which are in communication with each other. By far the largest of these are the two great cavities called the lateral ventricles, which are situated in the interior of the hemispheres of the cerebrum. Commencing in the fore part of the anterior lobes, these cavities proceed backwards in a direction parallel to each other through the middle into the posterior lobes. Their figure is indistinct, and are exceedingly irregular, and they are separated from each other by a tangle of medial matter termed the septum lucidum (fig. 11. 5). They are lined throughout by a fine transparent membrane, which secretes a fluid that keeps them moist, gives them a bright polished appearance, and prevents them from uniting. This membrane is the pia mater, which covers the external surface of the brain into these interior cavities, and some anatomists describe the arachnoid membrane as accompanying the pia mater in all its course through the ventricles.

The middle or third ventricle is a vertical fissure between
the two large convex eminences called the thalami optici (fig. 111. 4), situated in the middle and back part of the lateral ventricles. The fourth ventricle, called also ventricle of the cerebellum, is a cavity of considerable extent, situated between the cerebrum, the tuber annulare, and the medulla oblongata.

It is not necessary to enter into a more minute description of the several parts of the cerebral mass; but it is indispensable to a clear conception of the organization of the brain that something should be understood of the course of the fibres that constitute the main part of the medullary substance. For a detailed account of the course of these fibres, the reader is referred to the admirable work of Drs. Gall and Spurzheim, entitled Recherches sur le Système Nerveux en général, et sur celui du Cerveau en particulier in which the direction of the cerebral fibres is not only minutely and exactly described, but illustrated by excellent drawings as large as the objects. Some idea

that one-fifth of all the blood sent out of the left ventricle of the heart is carried to the head, yet the weight of the brain is not more than one-twentieth of the weight of that of the whole body. Even if this estimate, which is generally thought too large, be reduced to one-tenth, according to the idea of Monro, it will still leave a very great over-proportion. There is no part of the structure of the brain more curious than the various contrivances connected with the circulation through the head, which have for their object the prevention of this prodigious quantity of blood from producing any injurious effects upon the tender cerebral substance, whether by its pressure, or by its unequal distribution, or by its running away in the vessels, or of its being too violently propelled against them. Many conjectures have been formed respecting the object of furnishing this organ with such an extraordinary quantity of blood; but nothing is really known of the use to which it is applied, though the idea of the gratifying some degree of plausibility to the opinion that the brain has some analogy to a secreting organ. Without doubt, one use both of the ventricles and the convolutions is to afford a more extended surface by which the blood vessels may enter the cerebral substance at a greater number of points, and consequently in small quantity at any one point, while at the same time they are more firmly supported in their passage by the greater quantity of investing membrane with which they are supplied.

The cerebral substance, when examined by a powerful microscope, is found to be composed of a pulp containing a number of small particles or rounded globules. The pulp itself appears to consist of flocculi, likewise formed of globules, connected with each other by a matrix that would receive the ultimate globules being of a tolerably firm consistence and about eight times less than the red particles of the blood.

These observations, which were first made by Prochaska, have been confirmed in the essential points by the still more recent and elaborate examinations of a Florentine, who, by using higher magnifiers detected more clearly the constitution of the brain as composed of a series of these small globules, which were apparently of a cellular texture, and which constituted the whole solid mass of the organ. Bauer has described the fibrillae, or as they are more properly called, the fibres of the brain its fibrous appearance; that the diameter of the globules varies from 1/100 zoll to 1/100 zoll of an inch, the general size being 1/100 zoll; that they are both larger and in greater proportion in the medullary than in the cerebrum substance, and that they are connected together by a peculiar gelatinous matter.

Chemical analysis shows that the medullary matter consists of a peculiar chemical compound, unlike any other of the constituents of the body. In some respects this compound resembles a saponaceous substance, dissolving readily with water, and forming with it an emulsion which remains for a long time without being decomposed. Vauquelin has found in it two species of adipose or adiposaceous matter, soluble in alcohol, and the third the principle called osmazome, together with a quantity of albuminous matter, small quantity of phosphorus, and some saline matter, consisting principally of the phosphates of lime, soda, and ammonium.

Such is a brief outline of the nature and relation of the principal parts that enter into the composition of the brain. The functions of this organ will be considered in connexion with those of the spinal cord, and of the nerve. [Nervous System.]

*BRAND OF ANIMALS, its peculiarities and diseases.*

The most obvious distinction between the brain of the human body and that of the other mammalia is its diminished size in most of the latter. The moment the skull-cap is raised, the difference between the full rounded appearance of the former and the compressed flattened shape of the latter cannot fail to be observed. The convexity of the skull is greatly lessened, and the posterior lobe is in a manner lost in quadrupeds. If the brain is now removed from the cranial cavity, the difference in bulk between that of man and the inferior animals is strikingly displayed. The brain of the ox remains weighs a pound; the average weight of the brain of the human being is more than 2½ lbs.

In man the brain is supposed to constitute about 1-35th part of the weight of his body. In the dog, averaging the different breeds, it is 1-120th part; in the horse it is only the

As the reader may perceive some discrepancies between the two articles on the Brain, it is necessary to remark that these articles contain the respective views or opinions of two different writers.
450th part, in the sheep the 750th part, and in the ox the 800th part. Does there appear already a connexion between the relative bulk of brain and the quantity of mind? The bulk of the brain has alone been spoken of, but, in point of fact, these animals have just been ranged in the order of their relative bulk in the respective classes. The prominences and depressions which mark the surface of the brain in man, and which are supposed by phrenologists to indicate certain peculiarities of mind and disposition, are tame and inexpressive in the quadruped. They are not found in the hare, or the rabbit, or in the fish. They are not so bold or so deep in the ox as in the horse; nor so much in the horse as in the dog.

The brain is composed of two substances essentially distinct from each other, the medullary deep in the base of the organ, and the cerebral, immediately connected with the animal, and the other with the intellectual principle: the one the medium through which the impression made by surrounding objects is conveyed, and the other the substance to which that impression is referred, and where it is received, registered, and compared: the one the agent by means of which the voluntary motions of the frame are effected, and the other directing and controlling the working of the machine.

As an illustration of the greater size and development of the nerves of sense in animals, the olfactory one may be selected. In man, who has other means of judging of the qualities of his food, and of surrounding objects, than by the sense of smell, the olfactory nerve is not one-fourth of the size of that of the horse; in the ox, that is not so much disproportionate; and, as the feeling of the field is shifted for himself, it is considerably larger; it is larger still in the swine, who has to search for a portion of his food buried in the earth, or deeply immersed in refuse or filth; and it is largest of all in the dog, whose acuteness of scent renders it necessary to serve him.

The different development of the medulla oblongata in different animals may be adduced as another proof of the admirable adaptation of each to the situation which he occupies and the functions which he discharges. The medulla oblongata, moreover, and condensation of the medullary matter of the brain, and it is the origin of that portion of the spinal cord which is devoted to organic life. In the human being the breadth of it is only a seventh part of that of the brain; in the horse and the ox it is nearly a third; and in the dog it is more than a half.

In every part of the brain of the quadruped the medullary portion preponderates, and the cesticorius is deficient. In his wild state the brute has no idea beyond his food and the reproduction of his species: in his domesticated state, he is the custodian of his food and the guardian of his senses and that preponderance of animal power qualify him for this service; but were proportionate intellectual capacity added, he would speedily burst his bonds. It is, however, only in the proportions of the two substances that the brain of the biped and quadruped differs: the animal in the lower animals are found in each. It was necessary that in the servant of man some degree of intelligence should be added to animal power; that he should possess the faculties of attention, memory, and judgment, and that to these should be added not only the general, but, often, the peculiar development of courage, fidelity, gratitude, disinterestedness, and a consciousness of right and wrong.

In the smaller quadrupeds the comparative size of the brain approaches nearer to that of the human being. In that of the ox, there is a part of the brain which is larger than in the men of the order. But what is it composed of? Of the medullary matter which is necessary to form the origin of the nerves of pure sensation, and of those of the spinal cord, which are as numerous in a man as in a larger animal. This must necessarily occupy a considerable bulk; but there is little of the cesticorius matter, or that which is connected with the mind.

For several minor points of difference between the brain of the biped and the quadruped, the reader is referred to Dr. Gurney's Dissertation on the Hominidae, or comparative Anatomy, and to Dr. Gurney's On the Mammalia of Cuvier's Comparative Anatomy. The brain of the larger birds agrees with that of the mammals in the smallness of its bulk, compared with the development of the same organ in the human being. The brain of the goose is more than a two-hundred-and-sixtieth part of the weight of the bird; the brain of the goose is not more than a three-hundred-and-sixtieth part. If in some of the lesser birds, as in the chaffinch and the redbreast, it approaches to the proportionate size of that of the human being, it is, as in the smaller quadruped, on account of the quantity of medullary matter required for the origins of the nerves; and the cesticorius matter forms only a very small part of the brain. The brain of the bird has no cortical development except in the eye of the parrots, and in these genera, and does not constitute a two-thousandth part of the bulk of the fish. It scarcely half fills the cranial cavity, but is surrounded by a cellular tissue containing a transparent semifluid mass. It singularly varies in different species. It consists of at least four or five layers of cells, and the inner, which is contiguous to, and forming two parallel lines; and there is often only a very slight connexion between these lines, or the eminences of which either of them is composed. The two principal hemispheres of the brain and the optic thalami are always present. The olfactory nerves form a third pair of tuberces anterior to these and the cerebellum, and is always found posteriorly on the mesian line. The optic nerves usually cross each other without any intermingling of medullary matter. The cesticorius substance is found in an exceedingly small proportion in the brain of fishes

For as insects and worms, little needs to be said here. In the worm the brain or upper ganglion of the nervous system is placed near to, or may be said to be perforated by, the superior portion of the oesophagus, and thence proceed numerous nerves, which pass to the different parts of the digestive canal. In insects, the upper ganglion usually surrounds the oesophagus, and a ganglionic system of nerves can generally be traced proceeding from it. In the larvae of insects the brain is enclosed in a horny cavity. The animal's consciousness of pain coming from the general state of the whole of the abdomen, presenting evident ganglia at different points, from which nerves are distributed: while from the intermediate spaces are given out other nerves without ganglia; presenting a rude but satisfactory sketch of the cesticorius and medullary matter. The nervous system is covered by modern physiologists.

A sketch of the diseases of the brain in different animals can, in this place, scarcely extend beyond those that have been domesticated by man. The preponderance of the medullary matter explains the cause of the insufficiency of any affection of the brain that can be called insanities in animals. If there is so small a portion of cesticorius matter, if the intellectual principle is so slightly developed, alteration of the mind is scarcely to be expected. In a certain degree of this nature of diseases and insanities is served. It is one of the concomitants and characteristic symptoms of rables. Pure mental alienation unaccompanied by inflammatory or other disease is however, although very rarely, seen in the quadruped. The eagerness for its own amusement is in full exercise, making it, or the cat, will search out and pursue their own offspring in order to destroy them, and the evident delight with which they devour them, is not this insanity? The fury which some animals, gentle in every other respect, show at the sight of one object, and, without any previous or occasion, is not this true monomania? A mare that had not the slightest fear of any other object, was always roused to uncontrollable fury by the sight or rustling of paper; another mare would endeavours to fly upon and tear to pieces every light grey horse that came within her sight; another would rush furiously against every white object, animate or inanimate: were not these cases of monomania?

The brain of the quadruped is proportionally much smaller than that of man. Comparing bulk with bulk, the brain of the horse is not a tenth part of the brain of the ox is not a twentieth part so large as that of the human being. In a state of health, a much greater quantity of blood is determined to the brain than to any other part, in order to enable it to discharge its important functions. From some of former times the ancients supposed that the quantity of blood is sometimes determined to the brain of the human being. What is the consequence? All the vessels of that organ are overloaded—the origins of the nerves are pressed upon—no cerebral functions can be discharged—each man in his present state of things is in such a condition that the current is speedily diverted, and the overcharged vessels to a certain extent drained of their contents, he must inevitably
perish. From some exciting cause, the same determination of blood to the brain takes place in the ox: but his brain is not, proportionally, a twentieth part so large as that of the human being, and it is altogether unable to resist the impetus—its functions are suspended in a moment, and the animal drops and dies. How severe are the losses with which the soldier and sailor are afflicted? Teeth are being prepared for the market more eagerly and hastily than prudence would warrant; they have been under the influence of a stimulating and forcing system, and are covered with fat and full of blood. If they are inadvertently put, as a still more stimulating reed—men; they are turned into more luxurious pasture, or they are driven to the turnip-field. They have not been there many hours before one and another begins to heave violently at the flanks—the head is extended, the eyes are protruding, the ears are flapping, and the tail is three or thirty. The tail is large and forked; pectoral fins rather long and narrow; ventral fins small: the scales extend as far as the jaws.

BRAVETE, (Essex.)
Brauma, a genus of fishes of the order Acanthopterygii and family Squamipinnidae. Generic characters: dorsal, anal, and ventral fins more or less scaly; body much compressed, somewhat ovate when viewed laterally; the head rarerously obliquely terminated; mouth, when shut, almost vertical, with both maxillae united by a branchiostegous rays seven. But one species of this genus is known, Brauma Raiti. M. Cuvier mentions the Mediterranean as the chief locality for this fish; but at the same time he says that it occasionally wanders into the ocean. It appears, however, that it is not so local as M. Cuvier supposes, numerous specimens having been found on different parts of our own coasts.

Brauma Raiti measures from about one to two feet in length; it is of a deep blue colour, becoming silvery towards the belly. Tail elongated; anal, and the anal fin thirty. The tail is large and forked; pectoral fins rather long and narrow; ventral fins small: the scales extend as far as the jaws.

BRAMANTE, D'URBINO, or BRAMANTE LAZZORI, was one of the most eminent men in his profession at the time of the so-called revival of the arts in the fifteenth century; when he distinguished himself by a more accurate investigation of antique buildings than had before been adopted, whereby contributing in no small degree to keep alive the spirit of antiquity and upon the application of the Roman orations, arrogate to itself the title of 'classical,' and within a short time entirely superseded every other mode of building that had previously been obtained in Italy. Seconded by the circumstances of the times, and by the encouragement he could expect for his reputation which certainly appears quite adequate to his intrinsic merits. His name also derives some reflected lustre from being associated with those of Raphael (his relative) and Michael Angelo, not only as that of their imitator and imitator but also as that of the engraver he gave the talents of the one, and the degree of rivalry which existed between himself and the other.

According to some, Bramante was born at Castel Du- mante, in the duchy of Urbino; according to others, at Fer- rara. Amongst his other works, he is noted for the cupola of the cathedral at Florence; but this would be but a very small part of his original design; Filippo Brunelleschi (the architect of the then unruined cupola of the cathedral at Florence) died. Although in very humble circumstances, his family appears to have been respectable, and as he was by no means said to possess a natural aptitude for drawing, his father placed him under the celebrated artist Fra Bartolomeo of Urbino. The proficiency he attained in this part of his career is evinced by many pictures which he executed, and which are still to be seen at Milan; but his predilection for architecture prevailed over all other imitations, and he seems to have been expelled from the obsidian where he had already a fair prospect of success before him.

At first he travelled through Lombardy and passed some time at Milan, studying the works and constructions of the celebrated duomo in that city, which was the most extra- ordinary work of his time. In this city he proceeded to Rome, where after painting some frescoes (now destroyed) in the church of St. John Lateran, he determined to apply himself exclusively to investigating and measuring the principal antient edifices in that metropolis and its environs. He so thoroughly and completely engraven by his new pursuits, being incessantly occupied in making drawings, studies, and measurements of various works of antiquity. Among other edifices which he explored were the ruins of the papyrur on Carthage, and the ruins of the Capitoline buildings, the Villa Adriana, which, not having been thrown down by any one of the columns, marmors, and other ornaments since carried off, must have been far more instructive to the architect than at present, when its scanty remains are interesting only to the curios. Nor was the uncommon magnificence and grandeur of the buildings, upon which his admiration do not appear to have been regulated by that discretion and taste which shows that it appreciates real beauties, by rejecting all spurious alloy. Amplitude of masses and vastness of plan seem to have struck the imagination of the foreman projectors of St. Peter's quite as forcibly as that architectural tectility which is independent of extraordinary dimensions, arising rather from nobleness and greatness of manner consistently kept up throughout.

After extending his researches as far as Naples, upon his return to Rome it was commissioned by Cardinal Oli of Caraffa to erect the cloister of the convent DELla Pace; which, although not a work of any particular merit for its
design, gave such satisfaction as to bring him at once into notice, and obtain for him the patronage of Alexander VI. Under that pope however he did not execute any public works of importance, with the exception of the Cancelleria or palace of the chancery; a pile of imposing magnificence, and which contains the most spacious courts, libraries, and apartments of any of the papal palaces. Of the most splendid galleries formed by ranks of arches resting upon granite columns. Although such a combination of the column and arch constitutes in itself a mixed style, as it was here managed by Bramante it is at least free from absurdity, for he avoids both all appearance of entablature, and made his arches spring immediately from the abaci of the columns, which with the capitals may be considered as the impost surmounting circular instead of square piers: whereas blocks made to resemble pieces of an entablature not only cause the support to appear too bold, as if it appeared on the top of a column of considerable height, not call attention still more forcibly to the inconsistency of the two systems of architecture, by exhibiting the horizontal members, which columns were originally intended to support, so mutilated as to destroy all idea of connexion in a horizontal direction. We may therefore so far allow that Bramante proceeded upon rational principles, and likewise that he consulted effect no less than propriety; the mode adopted by him being more satisfactory to the eye as well as to the judgment. In the façade of the same building, where the pilasters are of the first order, in the basement, he was not so happy; and he either did not aim at the character of the antique, or else failed in his attempt. In proportion to the building the orders are too minute to assist the idea of magnitude otherwise than at the expense of regularity. There is a want of the grandeur of style in the mass, but not in the constituent features. The arrangement of the pilasters again is more unusual than agreeable, for they cannot be said to be coupled, but distributed so as to form wider and narrower intercolumniations alternately; in the former case the pilasters, in the others, are left blank—a mode which, without possessing the richness of coupled columns or pilasters, is equally, if not still more objectionable than they are. Another circumstance which does not contribute greatly to beauty is, that the windows of the pilasters are of two kinds: those of the first order, although crowned by a horizontal cornice, owing to which they have a heavy look in themselves, and also appear squat and depressed in comparison with the range above them. Nearly the same peculiarities, which may be taken as in some degree characteristic of Bramante's style in buildings of this class, prevail also in the façade of a palace begun, although not finished by him, in the street called Via Borgo Nuovo. This mansion, now called the Palazzo Giraud, has like the Cancelleria two orders of pilasters, forming narrow and wide intercolumniations; the former are of the first order, crowned by a horizontal frieze and cornice, but with these differences, that the lesser intercolumniations are narrower than in the other instance, although still of too great width to allow the pilasters to be termed 'coupled;' and the windows, instead of being there the same size, are here of two different sizes, one much larger than the other. The elevation of Julius II. to the pontificate was a fortunate circumstance for Bramante; for that pope, who was no less enterprising and resolute in civil than he was in military undertakings, was ambitious of signalizing his reign by some noble monuments of architecture and other arts. By him Bramante was commissioned to project plans for uniting the Belvedere with the buildings of the old Vatican palace, so as to render the whole, not if a coherent pile of regular building, at least an imposing mass. The architect seems to have been considerable, in order to connect those of long wings or galleries, between which should be a court. On account of the inequality of the ground, this latter was formed on two levels, with flights of steps leading up to the large niche or tribunal of the Belvedere. The design of this tribunal, which were five lesser niches containing the group of the Laocoon and other master-pieces of sculpture, may be seen (very rudely expressed) in Serlio's work on architecture; where is likewise shown part of one of the galleries or loggias—of the same that was copied by Sir Robert Vyner. In one part of the Belvedere of Julius II., which as they were then, and are now previously to the late alterations. This grand composition, which however was not completed by Bramante himself, has since his time undergone so many extensive changes, that it is impossible to judge from the place what it originally was; for the court has been divided into two by a range of buildings across it, at the junction of its two levels, which was erected by Sixtus V. for the Vatican library.

Complying with both the pope's impatience and his own, Bramante carried on the works at the Vatican with all possible dispatch, by night as well as day, in consequence of which precipitation many fissures afterwards discovered themselves. To reward the zeal and assiduity of his favourite architect, in the month of July he stipulated del Piombo, took him along with him in his military expeditions as his chief engineer, and otherwise manifested the confidence he placed in him. The credit he was in with the pope enabled him in time to patronise others, and he explored the honour of having been the first to recommend Raphael at the papal court; yet he has also been accused of availing himself of his interest with Julius for the purpose of thwarting the views of Michael Angelo. Certain it is that he persuaded the pope to abandon the idea of placing the tomb of Julius II. between the pillars of the Portico in the Lateran, and recommend Raphael to execute it. His measure of preference for Michelangelo was decided before he retired to Florence. Bramante accordingly commenced his new tomb, in the Via dell' Arco del Sepolcro, the fabrica di San Pietro. Giuliano di Sangallo was employed to make designs as well as Bramante, but those of the latter obtained the preference, and Sangallo felt so indignant that he retired to Florence. Bramante accordingly commenced the work, and in the expedition with which he proceeded, that the four great piers and their arches were completed before his death in the following year. On this occasion he had recourse to a new mode of executing the ornaments of the arches, by means of moulds fixed in the stones of which the arch was executed, and the stucco and brickwork before the arches themselves were turned,—a mode supposed to have been practised by the ancients, although quite gone out of use until again applied by Bramante. As his labours extended no further, and as the subsequent mutations of the church have removed some of his innovations, perhaps one of even still greater magnitude. As the model was not completed, we can only judge of his general intentions from the plan composed according to them by Raphael, which is given by Serlio in his work, and certainly, as far as it goes, is more artistic than the model. In this case, where one actually executed, and superior in perspective effect, inasmuch as there would have been a greater number of arcades along the nave, and an uninterrupted vista in each of the side aisles to the very extremity of the building; besides which there would have been a spacious portico in front, the entire width of the church, formed by three ranks of insulated columns. Further it has been observed, that instead of appearing less than its actual dimensions, as is notoriously the case with the present St. Peter's, Bramante's columns were of a size more as than the present, and if we suppose what was not executed, it would have looked more spacious and extensive than it really was. The form of the dome too, as proposed by Bramante, would have been more simple and more after the character of the antique, it being much less than a hemisphere externally, with a series of gradins similar to those of the Pantheon at its base, above the peristylium of its tambour; and it may here be observed, that it was Bramante, not Michael Angelo, who first projected the idea of surrounding St. Peter's by a rotunda and dome equal to the Pantheon; and that it was Bramante, who, although upon an exceedingly small scale, is the little Temple or Oratory in the cloister of San Pietro Montorio at Rome. It is circular in plan, and surrounded externally by a peristylium of sixteen Doric columns, above which rise the walls of the cells, forming a disproportionately lofty effect, with windows and niches placed alternately; this circumstance, together with the number of doors, windows, and
niches, gives the whole a heavy and confused appearance, utterly unlike the finished simplicity observable in the best antique models. Besides all this there is a particularly uncouth balustrade above the entablature of the peristyle, whose balusters are continued the whole circumference, without any intervening pedestals. At the best it is a mere monstrosity. The colonnades, which have produced a good general effect, had the circular court with a surrounding colonnade, for the centre of which it was intended, been completed according to the architect's design.

Numerous other buildings and projects are attributed to Bramante, but to some of these later claims are rather disputable, and of the edifices known to have been erected by him many no longer exist. He died at Rome in 1514, at the age of 70, and his remains were interred with unusual solemnity.

BRABAN,T, a vil. in the isl. of Java, about three m. N.N.E. from Djocjokarta in 7° 49' S. lat., 116° 25' E. long.

Brabante contains extensive remains of Hindu temples, which occupy an area of more than seven acres. The buildings, of which these are the remains, apparently consisted of four rows of buildings, inclosing a larger structure 60 ft. high. The buildings are all constructed of hewn stone in large blocks, and are uniform in their character, each of them being of pyramid form, and highly ornamented with sculptures. The large central building is discernible in the 4th, 5th, and 6th compartments of the temple, figures of Siva. The smaller surrounding temples are each furnished with an image of Buddha. There are four distinct entrances to the group, one facing each cardinal point of the compass; each of these entrances is apparently guarded by two large guardian statues, which appear to be as large as the walls are ornamented with sculptures in alto and basso relievo; a regular design is visible throughout the whole group of buildings, which exhibit in their embellishments less of what we consider fantastic and absurd than we are accustomed to find, and in similar remains in the same epoch.

It is believed that these temples were erected towards the end of the 12th or the beginning of the 13th century. (Crawfurd's Hist. of E. I. Archipelago.)

BRAMBER, a decayed vil. in Sussex, which was formerly of sufficient importance to give name to one of the six duchies in the ancient province of the Saxons, and which has hitherto been the only place of the name.

The Rape of Bramber is bounded on the N. by the co. of Surrey, on the S. by the English Channel, and on the E. and W. respectively by the Rapes of Lewes and Arundel. Its length from N. to S. is 23 m.; from E. to W. 11 m. It contains 10 villages, having 31 par. in the upper division, and 11 in the lower, and comprehends the bor. of Bramber, Horsham, New Shoreham, and Steyning. The bor. of Bramber was included in Schedule A of the Reform Act, and was consequently disfranchised.

Various practices were disclosed, during a parliamentary investigation into the election of members for the bor. of Shoreham. It appeared that certain electors of that bor. had formed a club which they designated the Christian Society, the business of which was to sell the representation to the best bidder. The chief magistrate, who was also returning officer for the bor., was a member of the club. An act passed, disfranchising the members of the club, and extending the franchise of Shoreham to the entire Rape of Bramber, which has been permitted to continue for two members for the bor. of Shoreham being elected by the qualified inh. of the Rape of Bramber. The total number of the pop. of the Rape in 1811, was 22,777; in 1831, 36,113.

The disfranchised bor. of Bramber, which is a vil. of the market rank, was not devoid of its ancient importance than the ruined castle of Bramber or Bramtre. The castle and manor were granted in 1066 by William the Conqueror to William de Braose. They now belong to the Duke of Norfolk. (The Gentleman's Magazine.)

BRAMBLE, a wild fruit-bearing bush, belonging to the natural order Rosaceae. ([R.]w.)

BRAMHALL, JOHN, Archbishop of Armagh, in the second half of the 15th century, and at Pontefract, in Yorkshire, about the year 1493, and was descended from an ancient family. He received his early education in the place of his birth, and was then sent to Sidney College, Cambridge, where he was admitted February 21st, 1568. In 1563 the Archbishop of York made him his chaplain. He was also

prebendary of York and Ripon. In 1563 he took the degree of Doctor in Divinity. Soon after he was invited to Ireland by Lord Viscount Wentworth, deputy of that kingdom, and Sir Christopher Wandesford, Master of the Rolls. There he soon obtained the archdeaconry of Meath, the best in that kingdom. In 1564 he was promoted to the bishopric of Killaloe, and held that see until his death; by which he obtained a yearly revenue by advancing the rents and recovering lands which had been detained from his predecessors.

Bramhall appears to have applied himself with about the same zeal in Ireland that Laud was then exhibiting in England for the increase of the wealth and power of the clergy. In pursuance of several acts passed in the Irish parliament, which met July 14, 1634, he abolished fee farms that were charged on church-lands; he obtained composition for the rent instead of the small reserved sum paid by the Crown; he obtained the Crown's appropriations. By these and other means he regained to the Church, in the space of four years, thirty or forty thousand pounds a year. He likewise prevailed upon the Church of Ireland to embrace the thirty-nine Articles of Religion of the Church of England, agreed upon in the convocation held at London in the year 1562. He tried also to get the English Canons established in Ireland, but did not succeed farther than that a few of them should be introduced, and other new ones framed.

In 1569-70 his work was not impeded, together with several other of Strafford's conductors, by the Irish House of Commons. He was in consequence imprisoned, and after some time, through the King's interference, set at liberty, but without any public acclamations. Some time after, while in London, he was sent to Ireland by Strafford, and went over to England, where he remained till the battle of Marston Moor; after which, the prudent counsels, which according to his biographer he bestowed upon the Marquis of Newcastle, not being able to resist the charge of Cromwell's Ironsides, and the bishop encountering the same in the battle of Turnhampton, were in vain; and, after a short confinement, and landed at Hamburg, July 8, 1644. It was during his exile, in the company of the Marquis of Newcastle, that he had that argument with Hobbes about liberty and necessity, which gave rise to the celebrated controversy, without which his prelate's character could not have been properly considered. At the treaty of Uxbridge, Bramhall had the honour to be classed with Laud in being excepted out of the general pardon.

At the Restoration, Bramhall was made Archbishop of Armagh, Primate and Metropolitan of all Ireland. He now renewed his exertions for the aggrandizement of the Church. He died in 1668. By his wife he had four children, a son, Sir Thomas Bramhall, bart., and three daughters.

Bramhall, whatever in his day might be his reputation as a bustling churchman, is now remembered, if he be remembered at all, by posterity on account of his controversy with Hobbes. As this controversy throws considerable light not only on the character of Bramhall but on that of his age, it is of importance to give some account of it, not only because it can be done, but because it could do it in the following passages, with which Hobbes concludes the work. As the controversy is now very scarce, this extract, even though not viewed as by any means setting the question at rest, will scarcely be considered too long, expanded into a longer view of the nature and style of Hobbes. As we have already remarked, the controversy originated in a conversation at Paris in the company of the Marquis of Newcastle, while they were all living there in exile. (Biol. Brit. art. "Bramhall.")
that all external causes depend necessarily on the first eternal cause, God Almighty, who worketh in us, both to will and to do, by the mediation of second causes—that seeing neither man nor anything else can work upon itself, it is impossible that any man, in the framing of his own will, should concord with external causes, without God's concurrence; for it is impossible that there was nothing to pass by fortune as by a cause, nor anything without a cause or concurrence of causes sufficient to bring it to pass; and that every such cause, and their concurrence, do proceed from the providence, good pleasure, and working of God himself. So it is that every event contingent, and say they happen, yet because they had every thing of them their several causes, and those causes again their former causes, I say they happen necessarily; and though we perceive not what they are, yet there is a plenitude of causes, to the number of those events whose causes we perceive, or else they could not possibly be foreknown, as by them that foreknow all things.

On the contrary, the bishop maintaineth—that the will is free from necessitation, and in order thereunto the judgment of the understanding is not always praxis practicum, nor of such a nature in itself as to obligate and determine the will to one, though it be true that spontaneity and determination to one may consist together;—that the will determineth itself, and that external things, when they change the natural motion of the soul, do not change the natural motion but by moral and metaphysical motion;—that when the will is determined naturally it is not by God's general influence, whereon depend all second causes, but by special influence, God concourring and pouring something in it; and further—no natural motion nor natural thing makes the act necessary; but because it may suspend and not assent, it is not absolutely necessary;—that sinful acts proceed not from God's will, but are willed by him by a permissive will, not an operative will, and he hardeneth the hearts of all men in case of unbelief—that man will in his own power, but his motus primo pristis not in his own power, nor necessary, save only by a hypothetical necessity;—that the will to change is not always a change of will;—that all things which are produced are produced from a cause, but natural motion or natural things are so necessary to the power of the will to be present in actu primo, then there is nothing wanting to the production of the effect;—that a cause may be sufficient for the production of an effect, though it want something necessary to the production thereof, because the will may be wanting;—that a necessary cause does not always necessarily produce its effect, but only then when the effect is necessarily produced.

He proveth also that the will is free, by that universal notion which the world hath of election; for when of the six electors the votes are divided, the way of reasoning is such:—that man will in his own power, but his motus primo pristis not in his own power, nor necessary, save only by a hypothetical necessity;—that the will to change is not always a change of will;—that all things which are produced are produced from a cause, but natural motion or natural things are so necessary to the power of the will to be present in actu primo, then there is nothing wanting to the production of the effect;—that a cause may be sufficient for the production of an effect, though it want something necessary to the production thereof, because the will may be wanting;—that a necessary cause does not always necessarily produce its effect, but only then when the effect is necessarily produced.

He proveth also that the will is free, by that universal notion which the world hath of election; for when of the six electors the votes are divided, the way of reasoning is such:—that man will in his own power, but his motus primo pristis not in his own power, nor necessary, save only by a hypothetical necessity;—that the will to change is not always a change of will;—that all things which are produced are produced from a cause, but natural motion or natural things are so necessary to the power of the will to be present in actu primo, then there is nothing wanting to the production of the effect;—that a cause may be sufficient for the production of an effect, though it want something necessary to the production thereof, because the will may be wanting;—that a necessary cause does not always necessarily produce its effect, but only then when the effect is necessarily produced.

He proveth also that the will is free, by that universal notion which the world hath of election; for when of the six electors the votes are divided, the way of reasoning is such:—that man will in his own power, but his motus primo pristis not in his own power, nor necessary, save only by a hypothetical necessity;—that the will to change is not always a change of will;—that all things which are produced are produced from a cause, but natural motion or natural things are so necessary to the power of the will to be present in actu primo, then there is nothing wanting to the production of the effect;—that a cause may be sufficient for the production of an effect, though it want something necessary to the production thereof, because the will may be wanting;—that a necessary cause does not always necessarily produce its effect, but only then when the effect is necessarily produced.

He proveth also that the will is free, by that universal notion which the world hath of election; for when of the six electors the votes are divided, the way of reasoning is such:—that man will in his own power, but his motus primo pristis not in his own power, nor necessary, save only by a hypothetical necessity;—that the will to change is not always a change of will;—that all things which are produced are produced from a cause, but natural motion or natural things are so necessary to the power of the will to be present in actu primo, then there is nothing wanting to the production of the effect;—that a cause may be sufficient for the production of an effect, though it want something necessary to the production thereof, because the will may be wanting;—that a necessary cause does not always necessarily produce its effect, but only then when the effect is necessarily produced.

He proveth also that the will is free, by that universal notion which the world hath of election; for when of the six electors the votes are divided, the way of reasoning is such:—that man will in his own power, but his motus primo pristis not in his own power, nor necessary, save only by a hypothetical necessity;—that the will to change is not always a change of will;—that all things which are produced are produced from a cause, but natural motion or natural things are so necessary to the power of the will to be present in actu primo, then there is nothing wanting to the production of the effect;—that a cause may be sufficient for the production of an effect, though it want something necessary to the production thereof, because the will may be wanting;—that a necessary cause does not always necessarily produce its effect, but only then when the effect is necessarily produced.

He proveth also that the will is free, by that universal notion which the world hath of election; for when of the six electors the votes are divided, the way of reasoning is such:—that man will in his own power, but his motus primo pristis not in his own power, nor necessary, save only by a hypothetical necessity;—that the will to change is not always a change of will;—that all things which are produced are produced from a cause, but natural motion or natural things are so necessary to the power of the will to be present in actu primo, then there is nothing wanting to the production of the effect;—that a cause may be sufficient for the production of an effect, though it want something necessary to the production thereof, because the will may be wanting;—that a necessary cause does not always necessarily produce its effect, but only then when the effect is necessarily produced.

He proveth also that the will is free, by that universal notion which the world hath of election; for when of the six electors the votes are divided, the way of reasoning is such:—that man will in his own power, but his motus primo pristis not in his own power, nor necessary, save only by a hypothetical necessity;—that the will to change is not always a change of will;—that all things which are produced are produced from a cause, but natural motion or natural things are so necessary to the power of the will to be present in actu primo, then there is nothing wanting to the production of the effect;—that a cause may be sufficient for the production of an effect, though it want something necessary to the production thereof, because the will may be wanting;—that a necessary cause does not always necessarily produce its effect, but only then when the effect is necessarily produced.

He proveth also that the will is free, by that universal notion which the world hath of election; for when of the six electors the votes are divided, the way of reasoning is such:—that man will in his own power, but his motus primo pristis not in his own power, nor necessary, save only by a hypothetical necessity;—that the will to change is not always a change of will;—that all things which are produced are produced from a cause, but natural motion or natural things are so necessary to the power of the will to be present in actu primo, then there is nothing wanting to the production of the effect;—that a cause may be sufficient for the production of an effect, though it want something necessary to the production thereof, because the will may be wanting;—that a necessary cause does not always necessarily produce its effect, but only then when the effect is necessarily produced.

339

BRA

have been the only representative of the order. Latreille proposes the following arrangement.

Section 1.

LOMFYPODA.

Feet never more than six, the articulations more or less cylindrical or conical, and never entirely lamelliform or foliaceous. The Branches are not numerous, and there is but one eye. Many have the mandibles furnished with a palpus or feeler, and though M. Strauss attributes this organ to the genera Cyclops and Strobila, which compose his order of Oestroploda, the elder Jurine and Mr. Ramdour have shown that it is also characteristic of Cyclops. The antennae are almost always four in number; and serve for locomotion. Three groups are arranged under this section.

CARCINOIDEA.

Shell more or less ovoid, not folded so as to convey the idea of a bivalve, but leaving the lower part of the body uncovered. The antenna never in the form of ramified arms. Feet ten, more or less, cylindrical or cetaceous. Females carrying their eggs in two external bags situated at the base of their tail. Some of this division have two eyes, but the genus Cyclops has but one.

Two eyes.

Shell entirely covering the thorax. Eyes large and distinct. Antennae intermediate, terminated by two bristle-like appendages.

Under this subdivision Latreille places the genera Zoa (Bose), Nebalia (Leach),* and Condylura (Latreille).* As there is no means of describing the figures of more than one genus of each, we select the first as an example. Latreille considers the genus Nicroth of Audouin and Milne Edwards to belong to the Pacilopoda (Pacilopoda), remarking at the same time that the feet, with the exception of those of Nebalia, resemble more those of Cyclops, and that the females also, like those of the Cyclops, carry their eggs in two small bags situated at the base of the tail.

Zoa (Bose) has the eyes very large, entirely exposed, and are entirely in the shape of horns upon the thorax. The following is Bose's description of Zoa pelagica which he found in the Atlantic Ocean. Body demi-transparent, four antennae inserted below the eyes, the exterior joined (coudes) and bident. A sort of long beak on each side of the eyes, and a pointed elongated elevation directed backwards upon the back. The feet very short and scarcely visible, with the exception of the two last, which are elongated or natatory. The tail as long as the thorax, curved and six-jointed, the last joint large, conchoid, and spined.

Slabber, Desmarest, Leach, and others, have contributed observations upon this genus, if indeed it may be so termed, and several species have been described. But if Mr. Thompson be correct, these animals have no right to any generic appellation or rank, being no other than larger species of Crustacea in their early state of existence. They thus become most highly interesting, as affording, according to him, positive evidence of the metamorphosis of the Crustaceus decapoda. Having taken certain Zoa in the harbor of Cape, Mr. Thompson states in the first No. of his Zoological Researches, (April, 1829), that he saw them undergoing the change, and that enough was gained to show that the distinctive characters of Zoa, and of Slabber's changed Zoa, (Zoa litoralis) were entirely lost, and

the members from being natatory and cleft become simple and adapted to crawling. To complete his proof of metamorphosis among the crustacea, he states in the same place, that he succeeded in hatching the eggs of the common crab (Cancer pagurus), the young of which were found to be similar in form to Zoa litoralis; and he concludes "The zoea undergoes this metamorphosis, being, in the first state of their existence essentially natatory, and the greater number of them becoming afterwards, in their perfect state, incapable of swimming, being then furnished with chelae (pinchers), and with feet almost perfectly reduced." But the publication of M. Rathke's elaborate researches on the formation and development of the crabs (Astacus fluviatilis*) shakes this general conclusion; for his observations prove beyond doubt that no such metamorphosis takes place in the state of the zoea; of which thing, however, to add, that Mr. Thompson, not one whit daunted by Rathke's publication, still holds his opinion, and, in a letter to the editor of the 'Zoological Journal,' dated Dec., 1836, states what he trusts will convince him, that any delusion exists, or source of error, it must rather attach to M. Rathke than to him; namely, that, in regard to the Brachyurus decapoda (crabs, &c.) he has ascertained the newly-hatched animal to be a Zoa in the following genera: Cancer, Carcinus, Poecilla, Erythrae, and Hermit. Thalasa, Panthoea, Inachus, &c., right in all; and that in the Macroura (lobsters, &c.) he has actually ascertained that the following seven genera are subject to metamorphosis: Pogorus, Porcellana, Galatheus, Crangon, Palaeon, Hymenodactylus, &c. He admits also that the lobster (Astacus marinus) undergoes a metamorphosis less in degree than any other of the above enumerated genera, and consisting in a change from a cheliferous Schizopoda to a Decapod;—in its first stage being what he would call a modified Zoëa with a frontal spine, spinate tail, and anterior sub-abdominal fins,—in short, as he says, such an animal as would never be considered what it really is, were it not obtained by hatching the spawn of the lobster. He then asks whether we are to consider the fresh-water species of Astacidae as subject to metamorphosis; and an answer to this is not reason, from the above detail, to suspect that this peculiarity must have escaped the notice of M. Rathke; adding that if it should be found otherwise, it can only be regarded as one solitary exception to the generality of metamorphosis; and rendering it peculiar, on that account, to consider those two animals for the future as the types of two distinct genera. Our limits will not permit us to go more amply into the subject, and we must therefore refer our readers to numbers 1 and 2 of Mr. Thompson's 'Zoological Researches,' for a more elaborate and illustrative account, and, if they cannot procure M. Rathke's book, to the 5th volume of the 'Zoological Journal,' now completed, where an excellent analysis of the latter will be found. We cannot, however, close this subject without earnestly exhorting those, whose localities afford the opportunity, to pursue this most interesting subject. The following figure of Zoëa clavata (Leach) taken by Mr. Cranch in the unfortunate expedition to the Congo, under Captain Tuckey in 1816, will give some idea of the general form of Zoa.

* Zoological Researches and Illustrations; or Natural History of Nonsurf or Imperfect Animals in a Series of Memoirs; illustrated by numerous figures by John V. Thompson, Esq. F. L. S. Surgeon to the Forces, &c. London, 1829, King and Youngman, p. 200. Zoological Researches, &c. &c. Five numbers published.
* A few days after publication, on the 30th of April, 1838, he took in a small mussel-towing-net, while crossing the ferry at Passage, Zoa clavata, Luberto, which was found in the Gironde. It was of the common and others, natives of the British fresh-water, and quite common. (Polyphymna Heilbronn, Cyclops, Prunea, &c.)

Since the publication of Mr. Thompson's experiments, Mr. O. Westwood, one of our most able entomologists, has given a very careful elaborate description of the development of a young of the common crab, which has carried Mr. Thompson's observations and confirmation of Rathke's. See the papers by Mr. O. Westwood and Mr. Thompson directly at variance with each other, 'Phil. Trans.' for 1838, part 2.

The report of M. Milne Edwards is also at variance with Mr. Thompson's theory.

* Zoëa clavata.
about fifteen days in the months of February or March) they acquire another pair of feet; they are then the genus *Nausithus* of the same author. After their first moult they assume the form and all the parts which characterize the adult state, except the teeth on the antennae. These teeth may be divided into two portions: their antennae and feet, for example, are comparatively short. At the end of two more molts they are fit for the reproduction of the species. The greater part of these *Entomocraea* swim upon their backs, darting about with vivacity, and possessing the power of moving either backwards or forwards. Their aliment generally consists of animal matter in preference to vegetable; but in the absence of the former they feed on substances of the latter description, and it is said that the fluid in which they live never enters their stomachs. The alimentary canal extends along the extremity of the body to the other. The heart (taking *Cyclops Castor* as the subject) is of a shape approaching to oval, and situated immediately under the second and third segment of the body. Each of the extremities of this organ gives off a vessel, the one going to the head, the other to the tail. Immediately below is another analogous organ, giving off at each end a vessel supposed to represent the branchiocardiac canals observable in the circulation of the *Decapod Crustacea*. Jurine, who on many occasions reduced the *Cyclops* to a state of complete amnesia and restored them to life, found that in the process of resuscitation the extremity of the intestinal canal and the supports gave the first signs of approaching animation, while the irritability of the heart was less energetic, and that of the antenna, especially in the males, of great activity. The outer segment of each antenna, and in the case of a portion of an antenna is cut off no change is effected at the time, but the organ is entirely restored in the succeeding moult. There are differences in the form of the antenna and body of *Cyclops Staphylus*, and in the kind of horny plate and cartilage of the parts of the antenna, but the larvae, which led Latreille to consider it as forming a distinct subdivision; and he seems to be of opinion that *Cyclops Castor* and some others, whose lower antenna and mandibular feelers are divided, beyond their base, into two branches, others, whose feelers are consolidated, may be a sub-genus, if it be true that the animal which forms the type has no inferior antenna; but he seems to doubt whether this absence was made out by Leach’s own observations, or whether the assertion is made on the authority of Müllier.

The genus *Cyclops* is an inhabitant of the fresh waters; and we select the common *Cyclops*, *Cyclops vulgaris*, *Leach*; *Monocorbus quadricornis*, *Linn.*; *Cyclops quadri- cornis*, Müllier; *Monocorbus à quatre fourches*, Geoffroy, as an example of the species belonging to their family.

The body of the common *Cyclops* has a somewhat swollen appearance and is formed of four rings, and prolonged to about one-third of its entire length. The tail consists of seven rings. The posterior antenna (antennules of *Jurine*) is the tolerable one of the four rings; the joints, the anterior antenna are three length of the posterior.

There are several varieties.

Var. *a.* Reddish; eggs brown, forming two oblique masses near the sides of the tail. Total length eighteeth of a line. This is the *Monocorbus quadricornis rubens* of Jurine.

Var. *b.* Whitish or grey, somewhat tinged with brown, rather larger than the preceding. Egg-masses greenish, forming nearly a right angle with the tail. Total length same as the preceding. This is the *Mon. quadri- tubiflus* of Jurine.

Var. *c.* Greenish, Direction of the two egg-masses intermediate between that of the egg-masses of the two former. Length nine-twelfth of a line. *Mon. quadri- striatus* of Jurine.

Var. *e.* A deeper green than Var. *c.* Eggs obscure green, passing a little into rose-colour when hatching is near, forming two masses attached to the tail, and appearing to be incorporated with it. Length the same as the preceding; *Mon. quadri- pravus* of Jurine.

According to *Jurine’s* observations, the common *Cyclops* when hatched is nearly spherical, and is furnished with four feet only and but two antennae. In this state it continues until the fifteenth day, and then a small elongation
of each upper jaw as in the nature of feet, and excludes from this number the presumed masculine appendages above mentioned, which he considers as filaments of five articulations proceeding laterally from the pouch of the matrix, and of the use of which he is ignorant. The two antennæ are terminated by a pencil of fine hairs. The case is hollow on one side and perpendicular on the other, which latter is hinged side, and nearly straight or a little sinuous or kidney-shaped on the opposite edge. A little in advance of the hinge, and upon the mesial line, is the single large blackish round eye. The antennæ, which are inserted immediately below, are shorter than the body, setaceous, composed of from seven to eight joints, of which the last are the shortest, and terminated by a pencil of twelve or fifteen fine hairs, which serve as swimming organs. The mouth is composed of a carinated labrum; of two large toothed mandibles, each furnished with the feeler of three joints, to the feeler of which a small branchial lamina of five digitations (interior lip of Ramdhör) is attached, and of two pairs of jaws; the two upper, which are much the largest, have on their internal border four moveable and silky appendages, and externally a large branchial lamina, prolonged on its anterior edge; the second are formed of two joints, with a short, nearly conical, and jointless feeler, also silky at the end. A short of compressed sternum performs the office of a lower lip (external lip of Ramdhör). The feet have five joints, the third representing the tarsus, and the last the tarsus; the two anterior ones, much stronger than the rest, are inserted below the antennæ, directed forwards with stiff hairs on long hooks collected into a bundle at the extremity of the two last joints; the four following feet are without these appendages on the body. The second pair, situated the middle of the under side of the body, are directed backwards, curved, and terminated by a long strong hook bent forwards; the two last, never showing themselves beyond the shell, are applied to the sides of the body for the purpose of sustaining the ovaries and terminated by two very small hooks. There is not a distinct joint observable in the body, which terminates posteriorly in a kind of tail, which is soft and bent upon itself downwards, with two conico-scataceous filaments fringed with three silky hair or hooks at the end, and directed backwards as backwards as backwards as backwards—backwards as backwards. The ovaries form two large vessels, simple and conical, situated upon the posterior sides of the body under the shell, and opening, one at the side of the other, at the anterior part of the abdomen, where the canal formed by the tail establishes a communication between them. The eggs are spherical.

*Thompson observes that Mac Leay, in his Histo Économique, appears to think, and not without reason, that Pentecoste shows the greatest affinity with the Ostreoids, among crustaceans.

**Ostéodaca.** Latreille; Ostrópoda, Straus. The shell of the Ostéodaca is formed of two pieces or valves representing those of a conchiferous mollusk or bivalve shell, but horn, not testaceous. As in the bivalves, the two pieces are united by a hinge, and when the animal is inactive they close upon and but in the body and the parts. The feet are ambulatory, six in number, and are terminated by a digitated swimming organ, and accompanied by a branchial lamina. The antennæ are simple, filiform, or setaceous. There is but one eye, which is composed of sensae. The mandibles and jaws are furnished with a branchial lamina, and the eggs are situated on the back.

Of this division there are two subgenera, Cythere, Müller, (Cytherea, Lamark,) and Cypris. Of the former, which is found in salt and brackish waters, among the sea weeds, and confers, very little comparatively is known. We therefore select Cypris.

Cypris has six feet; Ramdhör indeed allows but four, and Jurine gives eight. The first considers the two last as masculine appendages, and the second looks upon the palp or feelers of the mandibles and the branchial lamina

*Thompson observes that Mac Leay, in his Histo Économique, appears to think, and not without reason, that Pentecoste shows the greatest affinity with the Ostreoids, among crustaceans.*

**Ostréodaca.** Latreille; Ostréopoda, Straus.

The shell of the Ostréodaca is formed of two pieces or valves representing those of a conchiferous mollusk or bivalve shell, but horn, not testaceous. As in the bivalves, the two pieces are united by a hinge, and when the animal is inactive they close upon and in the body and the parts. The feet are ambulatory, six in number, and are terminated by a digitated swimming organ, or accompanied by a branchial lamina. The antennæ are simple, filiform, or setaceous. Cypris has six feet; Ramdhör indeed allows but four, and Jurine gives eight. The first considers the two last as masculine appendages, and the second looks upon the palp or feelers of the mandibles and the branchial lamina.
Cyprius ornata (magnified). Shell yellowish green, banded with green. A, side view; B, view looking upon the hinge. The bands commence behind the eye.

Cypris fusa (magnified). Straws. Valves brown, kidney-shaped, covered with fine prickly hairs. Antennae with fifteen fine bristles. In the view of the valves, the valves are supposed to be removed; the outline a showing their shape and their relative situation; b, origin of the hinge membrane; c, eye; d, anterior depository of the bristles; e, first; f, of the second; p, of the third; r, of the second pair; g, of the second pair; h, of the second pair; i, of the second pair; j, of the second pair; k, of the second pair; l, of the second pair; m, of the second pair; n, of the second pair; o, of the second pair; p, of the second pair; q, of the second pair; r, of the second pair; s, of the second pair; t, of the second pair; u, of the second pair; v, of the second pair; w, of the second pair; x, of the second pair; y, of the second pair; z, of the second pair; A, of the second pair; B, of the second pair; C, of the second pair; D, of the second pair; E, of the second pair; F, of the second pair; G, of the second pair; H, of the second pair; I, of the second pair; J, of the second pair; K, of the second pair; L, of the second pair; M, of the second pair; N, of the second pair; O, of the second pair; P, of the second pair; Q, of the second pair; R, of the second pair; S, of the second pair; T, of the second pair; U, of the second pair; V, of the second pair; W, of the second pair; X, of the second pair; Y, of the second pair; Z, of the second pair.

Fossil cypris.

Cypris Fusa, Desmarest, holds a place among the organic remains of the Wealden rocks of England. Mr. Fitch has recorded it in the Weald clay of the Isle of Wight, Swanage Bay, &c., and Mr. Mantell in the Hastings Sands. Desmarest notes the species as found in great abundance near the mountain of Gergovie, in the department of the Puy de Dôme, and at the Baume d'Allier, between Vichy-Beings and Cussac. Their great fruitfulness and the frequent mollusks noticed above may account in some measure for the quantities of their petrified exuvia. Cypris has also been found in the fresh-water limestone, beneath the Midlothian coal-field, at Burdiehouse, near Edinburgh.

Straus observes that Bennet asserts Baker to be the first author who has mentioned this crustaceous form, and that Baker has given a figure of it in the 'Microscope made Easy,' at plate 15; but Straus adds that neither in the edition of 1743, nor in that of 1744, is any account given of it, and that there is no 15th plate. There certainly is no plate 15 in the edition of 1744, nor any figure or description that will agree with Cypris, while there is, at plate 9, a very fair representation, and at p. 93, a very fair account of Cyclopa. Baker commences his account of the latter thus: 'We may find in the waters of our ditches several species both of testaceous and crustaceous animals, two of these
Ceratophthalmus, Latreille.

The Ceratophthalmus have ten pairs of feet at the least, and the maximum of those organs in this group is said to be twenty-two. There is no vesicular body at their base, and the anterior feet are never so long as the others, nor are they ramified. The body is either enclosed in a shell case, like a bivalve shell, or naked, the thoracic divisions being each furnished with a pair of feet. The eggs are sometimes sessile, small and placed very near together; sometimes, and indeed most frequently, they are mounted on the extremity of two movable pedicles. The eggs are either internal or external, and inclosed in a capsule.

Eyes sessile, immovable. Body inclosed in an oval case like a bivalve shell. Ovaries always internal.

The sub-genus Limnadia of Adolphe Bronn giart is an example of this structure. Limnadia Hermanni, Adol. Brongni. Daphnia gigas of Hermann, occurs in great numbers in the little pools of the forest of Fontainebleau, and we must refer the reader to Bronnigart's memoir in the sixth vol. of the 'Memoires du Musee d'Histoire Naturelle' for its description.

Each eye situated at the extremity of a pedicle on both sides of the head. Body naked and annulated throughout its length. No enveloping case or shell. Eggs contained in an elongated capsule situated towards the base of the tail, or at the posterior extremity of the body and thorax in which they have no tail.

With a Tail.

To this subdivision belong the Brine-shrimp or Brine-worm, Artemia, or Artemis, Leach.—Branchipus, Latreille, and Cirrophthalmus, Benedict Prevost and Jurine. We are now arrived at that development of form in the Brine-shrimp, where the numerous legs or feet become pedjdes adapted simultaneously to the purposes of locomotion and respiration.

The Brine-worm or Brine-shrimp, Cancer Saliinus of Linnaeus, Gammarus Saliinus of Fabricius, Artemis Salinus, Leach, Artemis Salinus of Lamarck, when fully grown is about half an inch in length and very transparent: it is said to have been first discovered in the salt pans at Lymeington by Dr. Maty. There these animals are found in myriads in rapid and continual motion in the saltersins, which are the open tanks or reservoirs where the brine is deposited previous to boiling. The brine attains the desired strength by evaporation from exposure to the sun and air in about a fortnight. A pint contains about a quarter of a pound of salt, and in this concentrated solution, which, as Mr. Ranwell observes, instantly destroys most other marine, and animals, the brine-shrimp reveals. It is further said that these Brine-worms are never found in the sun-pans where the brine is made by the admission of sea-water during the summer, and which are emptied every fortnight, but only in the pits or reservoirs (cleans) where it is deposited after it is taken out of the pans, and where some of the liquor constantly remains. So persuaded are the workmen of their utility in clearing the liquor, that they are accustomed to transport a few of the worms from another saltworks, if they do not appear at their own, and they increase greatly in a few days. Little however was known of the natural history of this animal till Mr. Thompson published his interesting observations in the sixth number of his 'Zoological Researches' (1834). He has there described and illustrated the gradual development of the embryo and the metamorphoses which it undergoes from its first production until it arrives at a perfect or adult state. These, he says, will be found to correspond with those of Branchipus, Cirrophthalmus and Apus, animals with which its alliance can no longer be doubtful. Apus bears a long journey very well. We have had a glass jar full of them in their native brine sent to London. They lived a considerable time and were in full life and activity, affording very satisfactory opportunities of observing their habits and of corroborating the statements of Mr. Thompson. They are constantly gliding with an even motion in the clear circumambient fluid, sometimes on their backs, sometimes on their sides, sometimes on their bellies, and seem to move with equal facility in every direction. Their transparency and the unwearying undulating

1. Branchipus stagnalis, male (magnified); a, a, composite or network eye; b, antennae; c, mandibuliform horn; d, d, proboscisform, movable tentacle, rolled spirally; e, simple rudimentary eye; f, f, feeler or parietal foot or ear; g, male organs; h, h, tail; i, i, terminal lamella; j, j, lower view of the head; k, tail of the female; l, egg-pouch; m, female organ; n, n, young Branchipus after the first moult.

Without a Tail.

The genus Eulimene, Latreille, belongs to this subsection. The body is nearly linear, and there are four short antennae almost of uniform length, of which the two smallest, which much resemble feelers, are placed at the anterior extremity of the head, which is furnished with two eyes mounted on cylindrical pedicles. The branchial paddles are eleven, and immediately behind them is a terminal disc-like gill piece in place of a tail, from whence issues a long, delicate, thread-like process, which may perhaps (according to Latreille) be an oovid. Eulimene albida, whose body is for the most part white, with its posterior extremity black (Artemia Eulimene, Leach), the only species described by Latreille, was found in the Mediterranean near Nice.

Aspidophora.

Of this last division of the Phyllopoda, Latreille says that they have sixty pair of feet, all furnished near their base with a large oval vesicle, the two anterior feet, which are much the largest, resembling antennae. A large shell or crust covers the larger portion of the upper part of the body. This shell is free, shield-shaped, not attached to the body. The eyes are sometimes sessile, others are set on pedicles, which are fixed to the head by delicate threads. Apus productus (see Boscibus, the formula of which has been reversed by the printer) is an example. Mr. Thompson figures a species, Apus Guidingsi, from the West Indies, and observes that there appear to be two European
species confounded under the specific name cancriformis, viz., Schoenher's and Dr. Leach's, which, as Flourens has shown, are not yet so degraded as Savigny, in which the elongated shield entirely covers the nataly members.

Mr. Thompson observes that there is a considerable approach between Artemis and certain Triobites (Bisphæthia, Sc.), nor can there be any doubt that the common trilobite shells contribute to the illustration of that most ancient race of crustaceans.

We have not, as yet, data sufficient to fix their proper position, but there is every reason for supposing that their organization was constructed upon the principle of having the same general form to reutilize both to locomotion and respiration.

TRILOBITES.

BRAND OR BURN. Brand, a disease in vegetables by which their leaves and tender bark are partially destroyed as if they had been burnt; hence the name of this disease, which was given by the German Farmers, of olden time, after that the leaves have been wetted by dew or gentle rains, so that drops adhere to them, and a bright sunshine has succeeded, every spot to which the water had adhered lost its natural colour, and became of a dark or yellow hue; and on closer examination it was found that the organization had been partly destroyed, and that these spots no longer possessed the power inherent in healthy leaves of exalting water and carbonising the sap which circulates through them. When this disease is extensive and attacks the young shoots and tender leaves, a general and complete death of the plant, and, at all events, enfeebles its growth, and prevents its perfect fructification.

The cause of this, like that of most diseases which are common to plants, has been vaguely ascribed to some unknowable atmospheric influences which has, for the most part, little or no foundation. That which appeared most plausible was, that the drops of water being apparently globular, collected the light of the sun into a focus, and produced a sufficient degree of concentration of the sun's energy to produce a temperature sufficient to cause the death of the plant. A little reflection will soon convince us that this will not bear examination. The drops which adhere to the leaves and the bark are not globes, but at best flattened hemispheres, and consequently cannot collect the rays of the sun upon one point, let alone in a focus to produce the death of the plant; whereas the spots are as large as the diameter of the drops, so that all the surface that has been covered with water is injured; whereas the focus of a globe, such as would actually burn the leaf, must be very small in proportion to the lens which concentrated the rays. It is much more probable that the effect of the water on the tender epidermis of the leaf or bark to which it adheres is similar to that to which it has on vegetable matter infused in it; it softens and dissolves a portion of it, especially when the temperature is somewhat raised, and destroys its vital activity, and increase the effect. It is well known that light is the great agent which produces the change in the sap circulating in the leaves, and that without light the healthy green colour of the leaves and bark, and the peculiar qualities of the decay are not produced. Little or no evaporation takes place from the leaves in the night, and the sudden excitement produced on the whole of the surface of the leaves by the rising sun in a clear morning tends to disorganize those parts to which the water adheres. We do not profess to answer the question, but it appears nearer the truth than any of those more commonly received. (De Candolle, Physiologie végétale, vol. iii. chap. iv. s. 2.)

It is a fact that the principal mischief arises from a sudden change of temperature soon after sunrise, especially when there has been a heavy dew or hoar frost in the night; and careful gardeners brush off the drops from their delicate plants before sunrise to guard against the brand. Every drop which falls on the leaves of tender plants collects the rays of the sun upon itself, and such concentrated heat produces a disease exactly similar to that which we have been describing; and although the vapour of fermenting dung has a pungent, ammoniacal smell, it will be found that the whole surface of the glass is nearly pure, and can have no peculiar corrupting effect. It acts merely as a disinfectant, and by stopping the evaporation, which is always rapid from the leaves of plants in a hotbed, produces a derangement in their functions, and ultimately disease.

BRANDENDORF, 1812 [Boys].

BRANDENBURG, a prov. of the kingdom of Prussia, derives its name from the Mark of Brandenburg, the ancient dominions of the reigning family; the Mark itself being indebted to it for its own denomination to the ancient t. that once occupied its site. Its present part is that which they were in former days; for the N.W. districts of the Electoral Mark (Kurmark) and the Alt-mark (Old-m.) have been incorporated with the prov. of Saxony; and the northern parts of the Neumark, adjacent to Pomerania, have been united with that of East Prussia, and on the former it is called Dahme bailiwicks, and other parcels of land, all of them once forming a portion of the districts of Wittemberg, Meissen, Querfurt, Sc., in the kingdom of Saxony, are now comprised in Brandenburg. With the exception of two insignificant tracts, situated on the terraced banks of the Oder and the Saal, the prov. forms a compact mass. Its boundaries are, in the N., the two grand Duchies of Mecklenburg-Schwerin and Strelitz, and the Prussian prov. of Pomerania; in the E., the provinces of Western Prussia, Posen, and Silesia; in the S., the prov. of Pomerania and Saxony; in the W., the prov. of Saxony, and the Hanoverian dominions. Brandenburg thus extends between 51° 10' and 33° 57' N. lat. and 11° 13' and 15° 12' E. long. Its area is about 15,350 sq. m., and occupies about a seventh part of the whole surface of the Prussian dominions; it ranks as the fourth prov. with reference to density of pop.

The whole of Brandenburg is an almost uninterrupted plain, slightly elevated above the surface of the Baltic. Its soil is composed of river sand, in some quarters mingled with silt and loam. The fens and marshes which cover a great a diversity in its character, that a general failure of crops is almost unknown; for a season unfavourable to one part is usually found proportionately beneficial to another. The more elevated and undulating parts of the surface, on the other hand, are clothed with forests, and the knolls and slight hills, especially on the border of the Oder and the Silesian frontier, are improperly called "mountains" by the inhabitants; among these are the Oderberge (m. of the Oder), the Nei- and Schlagdorfberge, in the vicinity of Guben, the Müggesberge on Lake Mügge, about 8 m. S. by E., the Spreewald in length, and the heights which run along the Havel. These are prominent features however in the midst of a wide and sandy flat, and intermingling with numerous lakes, many of them lying in deep hollows, form landscapes of considerable beauty and variety.

The most fertile districts are the low lands, termed the Havelland, the Brüche (or Carses) of the Oder, Warth, and Notzlay, the Spreewald (wood of the Spree), the N. and E. parts of the Ucker-mark, the Lenzerner该e on the Fries-land, and that is deminated the "Alte Land" (Old land) in Lower Lusatia. But Brandenburg contains many extensive heaths and moors, here called "Brennflächen or burning flats), which are a collection of drift sand, the cultivation of which has often baffled the utmost efforts of industry. The soil is generally sandy, so it isceedingly variable: the result of several years' observations fixes the maximum of heat at between 24° and 25° Reamur (86° and 88° of Fahrenheit); the maximum of cold is said to be —8° R. (18° below freezing of Fahrenheit), but the temperature is rarely so low as this for more than four days. It is also stated, that upon a comparison of one year with another, there are 210 clear, dry, and 153 damp and rainy days.

Brandenburg is either traversed or skirted by two of the principal railways of Germany; the Elbe, which forms its N.W. boundary for a short distance, and the Oder, which drains its E. districts. The Elbe skirts Brandenburg only from Sundau to Dömitz, and on this line of its right bank receives the Havel, Stepitz, and Eide. The number of tributaries of the river Elbe, which rises beyond its quarter, are protected from inundation by artificial dykes. The Havel, which is a channel for the efflux of the Böbitz and other small lakes in Mecklenburg-Strelitz, becomes navigable at Fürstenberg, below which point it enters the Brandenburg district, and in its further course, as far as Brandenburg and Spandau; and thence taking a W. direction through Potsdam, and the town of Brandenburg, it turns to the N.W. at Plauen, where it is joined by the canal of that name, skirts Rathenow and Havelberg, and into Berlin by two branches of the Spree and the Quitzöbel. It passes through a low tract of country, in which sand, woodlands, and pasture-grounds alternate; its width at Oranienburg is 100 ft., and at Spandau 2000, in consequence of passing through several lakes; below Brandenburg it narrows again to 500, and at its mouth increases to 500. A branch of it strikes off at Brandenburg.
and flows into lake Plauen. There is no riv. in the prov. so important for internal intercourse as the Havel. The Steppnitz rises on the Mecklenburg frontier, and flows past Meyenburg and Perleberg, until it reaches Wittenberge, where it falls into the Elbe; the wide issues from Lake Plauen, and forms the boundary line between Brandenburg and Mecklenburg, until it joins the Elbe near Dömitz in Mecklenburg. The principal tributary of the Havel is the Spree, which comes down from the Lusatian mountains and falls into the Elbe at Berlin (Weisse Elbe, or Mühlstr., or Mühlstrasse, Botbitus, Cöpenick, Berlin, and Charlottenburg, in its N.W. course, towards the Havel, into which it falls at Spandau. It is 100 ft. broad, where it is joined by the Mühlstrasse canal, and about 200 ft. Berlin, and is navigable from Cossenbät. The Spree is joined by both of which the Elbe and Mecklenburg are, are also two tributaries of the Havel, and chiefly useful to the N.W. parts of the prov. for floating rafts and timber. The E. side of Brandenburg is watered by the Oder, and enters the prov. of Pomerania. From Custrin northwards it divides into several branches, and forms a succession of islands. At the village of Gütstebière, 9 or 10 m. N.E. of the t. of Wietzen, it separates into two large arms, of which the E. is the most considerable; this arm is called the Oder, and is 200 ft. wide near Custrin, and, after a bend northwards, it winds round on the one hand to the S.W., and rejoins the western arm or Old Oder N. of Freienwalde, and on the other is conducted by a canal to a point lower down into the Old Oder, to the S. of Hohen- stemmen. Lowenfels, is, 200 ft. in breadth, and between these two arms, and nearly the whole line of the Oder below Frankfort is bounded on each bank by meadows and lowlands, which are dyked in at many points. The lowlands along the Oder are occasionally skirted by high ground in the neighborhood of Frankfort and Freienwalde. There are bridges across it at Crossen, Frankfort, Custrin, and Freienwalde. The chief tributaries of this riv. are the Bober, which descends from Silesia, enters Brandenburg at Naumburg, and flows N.W. to Crossen, where it joins the Oder. The Bober is 100 ft. wide, and is subject to inundations; the Neisse, or Lusatian Neisse, also descends from Silesia, enters the prov. to the N. of Muskau, pursues a northerly course to the towns of Forte and Guben, and falls into the Oder, opposite to a vil. called Schiedow; the Weisstrasse road is here firm, and the lands between them are subject to inundations: the Neisse, or Lusatian Neisse, also descends from Silesia, enters the prov. to the N. of Muskau, pursues a northerly course to the towns of Forte and Guben, and falls into the Oder, opposite to a vil. called Schiedow; the Weisstrasse road is here firm, and the lands between them are subject to inundations. The Weisstrasse road is here firm, and the lands between them are subject to inundations.

The Havel is united to the Elbe by the Plauen canal, which leaves the Havel at Plauen, and passing Genthin joins the Elbe, which is the nearer branch. This can. is about 21 m. in length, from 26 to 36 ft. broad, and 6 ft. deep; it has a fall of 16 ft. between the Elbe and Havel, and shortens the distance between Berlin and Magdeburg by about 55 m. The Ruppin Canal, which lies between the Rhin and Havel, unites Lake Ruppin with the Havel at Orenbaurg; it is about 29 m. long, and is very useful for the conveyance of peat. The Havel and Oder are connected by the Finow Canal: commencing at Lake Plauen, it runs E. into the Mühlstrasse canal, and thence flows in the deepened bed of the Fühne to Lake Liepe, and completes a line of rather more than 25 m. by joining the Oder near Oderberg: its breadth varies from 49 to 74 ft.; it has 15 locks, and a fall of 96 ft. The upper end of the Finow Canal is at Werbellin, which leads from the lake of that name into the Finow Canal, and as that lake is connected with Lake Grimits, establishes a navigable communication between the two rivers. In the same quarter lies the Templin Canal, which is useful for timber only: it begins from Lake Lobau to the E. of Templin, passes through several lakes, and joins the Havel above Zehdnick: its length is about 23 m. Between the Spree and Oder there is the Canal of Mühlstrasse and Trebsen, which is being derived from the celebrated Elector of Brandenburg, under whom it was constructed between the years 1662 and 1668. It leads out of the Spree from the vil. of Neunbrück below Beeskow, and pursues an E. course past Mühlstrasse and Oder-Lindow into the Oder: it is about 14 m. long, and about 56 ft. wide, but not of sufficient depth when the season is dry: the fall is about 65 ft. There are also in this prov. the Storkow Canal for floating timber, which unites Lake Dolgen with the Spree at Cöpenick, and the New Log Canal, which unites Lake Dolgen with the Mühlstrasse canal, and forms a part of the boundary between the circles of Frankfort and Potsdam, and of which we have already spoken as likewise denominated the New Oder. Brandenburg is much favoured by the water communication which exists between the Elbe, Oder, and Vistula, the Neisse, or Lusatian Neisse, and the Wartha, which falls into the Oder, by the flowing of the Netze into the Wartha, and by the connexion of the Netze and Vistula through the Bromberg Canal. There are a few mineral springs in the prov., but only two of any note, that of Freienwalde, and near Berlin.

The principal native productions of the prov. are corn of all descriptions, besides buck-wheat, vegetables, and fruit, hay and clover, &c., flax, hemp, tobacco, wine in small quantities, timber, domestic animals of the usual kind, game, fish, hay and clover, &c., flax, hemp, tobacco, wine in small quantities, timber, domestic animals of the usual kind, game, fish, hay and timber, &c.; and there are in the prov. some manufactures, chiefly of toys, musical instruments, and earthenware.

The majority of the inha. are of German descent; some are also of Wend extraction, and not a few of French. Most of the French are settled in Berlin; the Wend colonists, in number about 160,000, reside in Lusatia, the bailiwick of Schwedt, where they are divided into two societies, the Old and New Mark; and in some few parts there are Herrnhutters and Mennonites, particularly at Berlin. The progress of the pop. during the last eighteen years is shown by the following table:—

The present pop. may be estimated at 1,624,000 souls, of whom about 920,000 form the rural pop., residing in 4379 villages and hamlets, and about 620,000 live in towns and cities; the remainder are in 152 cities and towns, of which 70 are in the circle of Frankfort, and 82 in that of Potsdam.

The Brandenburg return for the year 1835 is—

The majority of the inha. are of the Lutheran religion; but the royal family, French refugees, or their descendants (commonly called Hugonots), and a small portion of the German pop., are of the Reformed Lutherian Church. The following classification for 1831, the last year for which return was made, gives the number of communicants under four heads:—Protestants, 1,338,687; Roman Catholics, 15,431; Mennonites, 327; and 9210 Jews. In 1831 the number of births was 58,059, and deaths 58,059; the marriages amounted to 12,195.

No. 315. [THE PENNY CYCLOPEDIA.]}
As to agriculture, it appears from Krause's statement for the year 1831 that, excluding the pop. of Berlin and other towns, the average number of acres annually brought under cultivation is 16,000 per individual; whereas, if the agricultural pop. only be included, it does not amount to more than 8,8. It has been estimated that the number of acres in Brandenburg under the plough, or used for the production of tobacco or hops, is about 6,700,000. Potatoes and vegetables are very extensively grown, and the quantity of land employed as garden-ground is said to be 63,000 acres. More flax is produced than is sufficient for domestic consumption, but hemp is of limited cultivation. Under such a lat. it is not so much a matter of surprise that little wine should be produced, as that the grapes should yield a sufficient quantity to yield it; the wine is however of very indifferent quality, and is only partially made along the banks of the Neisse, Havel, and Oder, about Żułichau, and a few other spots. The crops of fruit are not adequate to supply the demand. The woods and forests are estimated to cover 3,300,000 acres; the sandy eminences and plains produce mostly flax and vines, but there are forests of oaks which yield a very superior description of ship-timber; the largest tracts of woodland lie in the districts N. of the Warthe and Netze, in the New and Ucker Masaze, and the S. and W. districts of Brandenburg. Considerable quantities of tar and potashes are manufactured.

Great attention is paid to the rearing of cattle; the most thriving branch is breeding sheep, the number of heads of which increased in 1830 to 1,425,150, 1,422,633, 1,394,899. The wool produced in the New Mark, the flocks of which constitute about one-third of the whole stock, is considered the finest in the Prussian dominions; of this stock 443,778 were, in 1831, of the most improved breed. The number ofgeois and individuals who have introduced the best English and other foreign breeds into the country, but they do not seem to have effected an increase of the stock, since it fell between the years 1828 and 1831 from 1,638,348 to 1,628,582. The greatest number of horned cattle are bred on the reclaimed grounds and in the marshes along the rivers, but the breed is indifferent and small in size, nor is the stock increased; the numbers varied between 1828 and 1832; 866,141; but in consequence of the devastations occasioned by the intervening wars, they did not amount to more than 502,981 in 1831, and have since diminished to 501,324. Swine are not reared in any considerable numbers; in 1831 they numbered 998,189 heads, and in 1832 did not exceed 187,187. Much honey and wax is produced, particularly in the six Lusatian circles, the heaths of which afford abundance of flowers for the bee. The inland consumption is amply provided with fish, especially eels and crabs, but none are exported, and foreign species are in great demand.

Brandenburg is poor in metals and minerals, nor are there any regular mines in it; small quantities of bog-iron are obtained near Ruppin and in the Uckermark. There are very considerable lime-works near Rüdersdorf; much gypsum is raised at Speenraben; and large supplies of alum are obtained from Freienwalde, Gleissen, and Kanich. Coals are dug at Zilenzig; peat is plentiful, as well as potter's clay.

Brandenburg possess considerable manufactures, though it is perhaps true to say, upon the whole, a manufacturing prov. as much as they are confined to a few towns, and the prov. itself participates very partially in their operations: spinning and weaving are the only branches in which the rural pop. take any part. The first manufactures were established by the Hugonot refugees, who received cordial assistance from the government, and were liberally seconded by it in their outset. The woollen manufactures, which are the most important, are established in most of the towns in the Old and New Mark; those for the finer sorts of goods are at Königisberg, Ruppin, Nauen, Züllichau, Kustrin, Zitzen, Zehdenick, Schirzi, and Köslin. Woollen clothes and merino cloths are made in Berlin, where woollen yarns are spun on a large scale by steam-machinery. The manufacture of linens, chiefly of the middling and coarser sorts, is extensively carried on in the Lusatian districts and the provinces of Prussia, and a part of them is confined to Berlin: the inl. have brought the manufacture of other articles of luxury to great perfection. There are large tanneries in several quarters, particularly in Köthbus and other towns in the circle of Frankfort. The number of paper-mills is upwards of 30, but they are quite inadequate to meet the demand for the Berlin trade, or indeed for the prov. in general. Besides the manufactures of this prov. there are a few other manufactories existing in most of the towns; and in the making of plate and other glass porcelain, and earthenware, no part of Germany excels this prov. Iron and steel works and cast-iron goods are principally manufactured at Berlin. The last-mentioned manufactury is not confined to the city proper, but is carried on in the suburbs. The most celebrated is the Berlin manufactury, to that city the manufacture of ladies' necklaces and bracelets of cast-iron, which are much prized. There are smelting furnaces for iron at Götow, Vieta, Pleiskau, &c. Copper is also smelted in the Mark on a more extensive scale than in any other part of Prussia, as well as at Crossen and Rosbach; and there is a large gunpowder manufactury in the neighbourhood of Berlin. Heavy duties are exacted on the introduction of foreign productions, particularly such as are likely to interfere with the interests of the domestic manufacturers.

The trade of Brandenburg is greatly favoured by the multitude of its navigable riv. and can., the last of which establish a long line of communication between the Elbe, Oder, Havel, and Spree. The main objects of this trade are through Hamburg by the Elbe, and through Stettin by the Oder; but the former is cramped by the monopoly of transport enjoyed by the guild of the Markish navigators. Berlin is the great centre of commercial enterprise, not only for this prov., but the whole of the Prussian territory; and in the wholesale trade of this prov. there is a great deal of which are still of considerable magnitude, especially with reference to the sale of Brandenburg produce and manufactures. Brandenburg, Guben, Havelberg, Küstrin, Landsberg, Potsdam, Prenzlau, Rathenau, and Žułichau are also places of considerable trade. There are banks for drawing bills and loans in some of the towns; but the principal establishments of this nature are at Berlin.

For the purpose of civil government, Brandenburg is divided into two circles of Potsdam and Frankfort, both of which are subordinate to the control of a president-in-chief (Ober-president), who is resident in Potsdam. Immediately under him are the protestant bishop, the consistory, and board of provincial schools; his authority also extends over ecclesiastical matters, all establishments for education, charity, hospitals, boards of trade, and the office of rents at Berlin, and the department of the mills. He is president also of the provincial states, which have no power to discuss or reject what the government brings to be fore them, but are a purely administrative body. They consist of one-fourth of the landholders of the prov., and the account of Solms-Baruth, 32 deputies from the aristocracy, 23 from the towns, and 12 from plebeian landowners and the peasantry. In regard to military matters, Brandenburg and Pomerania conjointly form one of the seven great military subdivisions of the empire.

The circle of Potsdam contains an area of 7833 sq. m. and 15 minor circles, viz. Berlin, East Havelland (cap. Nauen, about 3700 inh.), Prenzlau (c. Prenzlau, 11,000), Templin, Angermünde (c. same name, 3400), Upper Barnim (c. Freienwalde, 2100), Lower Barnim, Teltow-Storkower Jüterbog-Luckenwalde (c. Jüterbog, 4400), Zauch, Belzig Potsdam (c. Potsdam, 25,000), West Havelland (c. Brandenburg, 13,200), Ruppin (c. New Ruppin on lake R., 7600), East Prenzlau, and West Prenzlau (c. Potsdam, 5500).

The circle of Frankfort contains an area of 5717 sq. m. and 17 minor circles, viz. Königsberg (c. Königsberg, 4900 inh.), Soldin (c. Soldin, 4400), Arnswalde, (c. Arnswalde, 3600), Friedeburg (c. Friedeberg, 3900), Landsberg (c. Landsberg, 5800), Küstrin (c. Küstrin, 5600), Lebus (c. Frankfort, 22,960), Stettinr (c. Stettin, 5600), Züllichau (c. Züllichau, 4300), Crossen (c. Crossen, 4400), Guben (c. Guben, 8600), Lubben (c. Lubben, 3700), Luckau (c. Luckau, 3700), Kalau, Kottbus (c. Kottbus, 8100), Sorau (c. Sorau, 4700), and Spremberg (c. Spremberg, 3900).

(From Kräusel and Stein's Pr. Monarchy; Hassel's Pr. Mon.; Unge- witter; Hürschelmann; Official Returns, &c.)
of the Emperor Augustus, Drusus, his stepson, compelled the Suevi, who dwelt in what was afterwards called the Middle Mark, and the Langobardi, which peopled the districts subsequently termed the 'Old Mark,' to accept Vannius as their ruler. A few years after the birth of Christ, the Langobardi were subjugated by Maroboduus, king of the Marcomanni, at that time sovereign of Bohemia; and, a.d. 17, we find them engaged in a hostile expedition on the Danube, which was repulsed and then fell into the hands of the Vandals or Slavonians, one race of whom, the Vilzaco, settling in the Middle Mark, founded several towns, of which Brennabor or Brandenburg was one. These new settlers were subsequently subdued by the Franks, from whom the whole country derived its name, and in the beginning of the second century, and Prince Brando, who founded the new town of Brandenburg; a.d. 230. Thirty years afterwards, the Vandals having regained their sovereignty, repopulated themselves of the country, and maintained its independence. In a.d. 789 they fell under the sway of Charlemagne after a severe contest; and in 808 he appointed a count to act as his viceregent in Brandenburg. His successor also sent two princes to Saxony to fill the same office. He had likewise conquered the Lests, or Lichem, in the Havel and the Rerich in the Ucker-marke, under conditions that gave certain points to the counts of Stade. These were the first markgravies of Lower Saxony, or the Brandenburg State; they were also known as the Mark of Stade, the mark having passed into the hands of the earls of Stade. The Stadtholder continued to struggle for their independence in this quarter until the year 1144, when the emperor Lotharius conferred the north mark as well as the Saalwerder-mark on Albert the Handsome (called the Elder), the oldest son of Henry the Lion. A few years after his death, the duchy of Saxe-Saalfeld was established, and his eldest son became the first prince of the mark of Thuringia. The duchy of Saxony was established in 1153, with the title of Duke of Saxony, and was made hereditary by John George in 1571, who inherited the new mark and principality of Cöln from his uncle, and under whom Brandenburg entered upon a period of extensive development. The duchy of Prussia, founded in 1598, another equally paternal sovereign, Joachim Frederic, his son, who was bishop of Havelberg, Lusen, and Brandenburg, and incorporated the possessions of his diocese with the electorate. He founded the gymnasium at Berlin, and made it one of the best public schools in Europe. He died in 1608. Frederic Sigismund, his son and successor, inherited not only a moiety of the domains of Juliers, Cöves, and Berg, but shortly before his death, the duchy of Prussia, which was at that time a Polish fief. The latter was restored to Maximilian, who had been deposed in 1598, and came part of the electorate, and Brandenburg and Prussia then became the thenceforward rank as a single state. He embraced the Protestant reformed religion, but not without exciting some serious commotions in Berlin. In 1619 he was succeeded by George William, whose short reign was marked by the battle of Lützen and the capture of the Swedes and their camps by the imperial army. In 1620 the Swedes and Poles occupied Berlin. The next year the Swedes and Poles were defeated by the imperial army, and the city was captured by the Elector. The latter was succeeded by his brother, and the city was again captured by the Swedes in 1623. The city was taken by the imperial army in 1625, and the Swedes were driven out of the province of Brandenburg.
paigned Prussia from their presence. At the time of his death, which occurred in 1688, this illustrious prince left the electorate in a state of renovated prosperity, and greatly augmented power and extent. His son, Frederic III., assumed the regal dignity in 1701, under the style and title of Frederic I., king of Prussia. Frederic William evinced no favour to his new capital, and the town was afforded to multitudes of refugees from other parts of Germany, and to 20,000 Huguenots, whom religious persecution expatriated from the soil of France, and who introduced the silk and other manufactures into the country. He was a munificent and judicious friend to the arts and sciences. One of his objects was the ruined by the calamities of war; re-established the condition of many towns which the same calamities had impoverished, built number of villages, was a zealous promoter of agriculture and commerce, and established a post-office in his dominions. Between the years 1730 and 1734, the king founded the royal library in Berlin, and constructed the Müllrose or Frederic William's Canal between the Spree and the Oder.

[Prussia.]

BRANDENBURG, the capital of the minor circle of Westphalia in Prussia, from which the Old Mark of B. derives its name, was in former times called 'Brennabor,' or the Burgh of the Forest: it is situated upon the Havel, which divides the old from the new town, with an island, on which stand the castle, cathedral church, and equestrian college. Between the old and new town lies a swampy district, which, from its houses being built upon piles, is styled 'Venice.' Each town is surrounded by a wall, but the new town has a rampart in addition; the old town has five gates, besides a smaller outlet for foot passengers; and there are four gates in the new town; the streets in the first are narrow and crooked, but in the last-mentioned they are broad and straight. Inclusive of the cathedral church, there are eight churches; there is a column, called the 'Rolandsstuhl,' in the middle of the market-place in the new town. The number of the houses in the old town is 13,600 in 1,200 circles and 1,400 houses; a considerable increase since the year 1816, when the numbers of the old were 10,575, and of the new 1,320. It is the seat of a court of justice and a central tax-office, possesses a high school or gymnasium, a civic school, and Protestant as well as Catholic institutions for the education of the youth. The number of the inhabitants is 35,000. It is a town of great commerce. It has a large woolen manufactory and a superior academy for women, the (Töchter-schule), five elementary schools, three schools for indigent children, five hospitals and benevolent asylums, and a house of correction or poor-house (Strafanstalt or Armen-Anstalt). The manufactures consist of woolens, linens, brandy, beer, leather, stockings, &c.; ship-building, fisheries, and a considerable trade with the interior, are carried on; and some wine is made in the neighbourhood. The cathedral church, which has been renewed in modern times, is a large and beautiful edifice, and is the former ancient church of St. Catherine for its baptismal font and library. It was once the capital of the electorate of Brandenburg, and had the right of giving the first vote in the assemblies of the provincial states, a right now exercised by Berlin. The town is in 52° 2' lat. and 13° 10' E. long. (Hassel), about 34 m. W. by S. of Berlin.

BRANDENBURG, NEW, a town in the grand duchy of Mecklenburg-Strelitz, on lake Tollen, is built in a circular shape, surrounded by a substantial wall, with some remains of ramparts and ditches; and is the chief town in the circles of Stargard. The streets are broad, and at right angles to one another; it has a castle or palace, a spacious townhall, a high school, a lower school for townsmen's sons, another for girls, an elementary school, 43 brandy distilleries, manufactory of paper, pitch, and woad, three cotton-print factories, and a market for wool. It contains about 660 houses and 6000 inhab. It is about 70 m. N. of Berlin, in 53° 30' N. lat. and 13° 15' E. long. (Brauns.)

BRANDY is the alcoholic or spirituous portion of wine, separated from the aqueous part, colouring matter, &c., by the process of distillation. This word is of German origin (branntwein), meaning burnt wine, or wine which has undergone the operation of fire. Although the word brandy, when used by itself, means the spirit of wine, yet some varieties of it have been manufactured and used; such are potato-brandy, brandy from carots, pears, and other vegetable bodies containing fermentable matter: these however are so well known in flavour and brandy. In France, rum, arrack, geneva, malt-spirit, &c. are compre-

* At this period the territorial surface of the electorate was nearly 36,250 sq. m., and its pop. 1,200,000.

Mr. Faraday (Quarterly Journal, vol. viii. p. 68) has given the following as the quantities of alcohol, of the strength, and at the temperature above-mentioned, contained in the wines of Bina—:

\[
\begin{array}{lcc}
\text{Wine} & \text{Per Cent.} \\
\hline
\text{Apta (red)} & 18'09 \\
\text{do. (white)} & 16'16 \\
\text{do. (Sercial)} & 19'00 \\
\text{do. (white Port)} & 18'36 \\
\text{do. (red Port)} & 20'00 \\
\end{array}
\]

It has been already stated that brandy is obtained not only from wine but also from the marc, or fermented pressed grapes; this brandy has a more ascetic flavour than that procured from wine, which has generally been attributed to an admixture of an essential oil contained in the grape-stones. M. Aubergier (Ann. de Chim. et de Phys. lxi.) has published some experiments which tend to prove that this ascetic taste is derived from an oil contained in the skin of the grape. He found that the grape-stones, distilled either with water or alcohol, yielded a liquor which had a very agreeable flavour of almonds; grapes subjected to distillation produced a weakly spirituous liquor, which had neither the smell nor taste of brandy distilled from the marc; but the skins separated from the grapes and the stones, were submitted to a similar distillation, which yielded a brandy perfectly resembling that from the marc. M. Aubergier afterwards succeeded in separating this oil from the marc-brandy, and he found it so ascid and penetrating, that a single drop was sufficient to deteriorate several gallons of good brandy.

Although brandy is imported into England from various places in France, as from Bourdeaux, Rochelle, and Nantes, yet that of Cognac, a town in the department of Charente, is preferred to all of them; and M. Aubergier states that this, as well as that from Andraye, is of superior quality because it is obtained from white wine, fermented so as not to become impregnated with the oil of the grape-skin.

Brandy, when recently distilled, like spirit obtained from other sources, is well known to be colourless; by mere distillation however it acquires a slight colour, owing probably to some change in the properties of the soluble matter contained in it. The colour is much increased by keeping in

casks; and it is made of the required intensity by the addition of colouring-matter, as burnt sugar. The spirit procured from these generally retains with great obstinacy the flavour of the substance yielding it, which circumstance renders these brands so much inferior to those brandies which are employed for table purposes.

BRANDY STATISTICS. In all wine-producing countries, a part of the produce of the vineyards is converted into brandy, and in some of those countries a part of the spirit is employed to give strength to the remaining portion of the wine. The Anjou wines of Portugal, Madeira, the Cape of Good Hope, and other countries, are thus treated.

There are no certain means of knowing what proportion of the produce is distilled in different places. The only country in which, as far as we know, the estimate of this fact has been made in France, where an idea of its amount was to be inquired concerning the duties levied upon liquors, has given an estimate of the produce of the vineyards, and the mode of its disposal. From this it appears that about 15 per cent. of the wine is made into brandy, but as the spirit which it yields varies in quantity according to the quality of the wine from which it is made, it is not possible to state its amount with precision. It has been estimated that the quantity of brandy annually made is equal to about twenty millions of English gallons, of which about one-third is exported, leaving between fifteen and sixteen millions for consumption in France.

The principal exports are made from the Charante, from Bourdeaux, and from the port of Ceté in the Mediterranean (dep. of Herault). From Charante comes the quantity of Charantes brandy imported into this country, which country three-eighths of all the shipments of French brandy are ordinarily made. About one-fourth is taken by the Americans, chiefly from Bourdeaux and Ceté, and the remainder is shipped in comparatively small quantities to the French colonies in India, and to various countries in Europe, chiefly to the north.

Until the early part of the present century, considerable purchases of Spanish brandy were made by the English government for the use of the navy; but at that time, with the view of securing our own supplies, this practice was substituted. The shipments of brandy from Spain are principally made at Barcelona, whence about 11,000 pipes (about 1,200,000 gallons) are annually exported. Of this quantity 3000 pipes are sent to Cuba, 6000 pipes to the former dominion of Spain in America, and 2000 pipes to the N. of Europe.

The consumption of brandy in England was greater half a century ago than it is at present. In the five years from 1765 to 1769, the average quantity amounted to 1,731,041 imperial gallons; whereas in the five years from 1820 to 1824 the average has been only 1,379,547 gallons; the duty in the mean time having been advanced from 6s. to 22s. 6d. per gallon.

The quantity warehoused under the king's lock is equal to about one year's supply: three-fifths of this quantity are lodged in the docks of London. The quantity in the stocks of dealers is usually about half a million of gallons.

The quantities imported and exported, and those taken for consumption in the United Kingdom, during each of the eight years from 1827 to 1834, were as follows:

\[
\begin{array}{lcc}
\text{Exported.} \\
1827 & 1,724,805 \\
1828 & 2,251,069 \\
1829 & 1,994,649 \\
1830 & 1,649,469 \\
1831 & 1,461,897 \\
1832 & 2,671,828 \\
1833 & 2,623,313 \\
1834 & 3,179,297 \\
\hline
\text{Imported.} \\
1827 & 629,526 \\
1828 & 1,050,972 \\
1829 & 661,097 \\
1830 & 466,610 \\
1831 & 594,172 \\
1832 & 691,656 \\
1833 & 793,487 \\
1834 & 912,335 \\
\end{array}
\]

The exports are chiefly made to India and to our colonies in N. America, which latter took 10s. per gallon.

The rate of duty per imperial gallon, which was 6s. in 1787, received several small additional duties in 1793, 1794, and 1795, and in 1796 it was raised to 10s. per gallon. In 1803 it was further raised to 16s. 7d.; in 1809, to 20s.; and in 1812 to 24s., and raised still further; by mere distillation however it was reduced to 22s. 6d., at which rate it has continued to the present time.

BRANDYWINE, a small river which rises in Chester county, Pennsylvania, and joins the Christians, in the upper
part of the state of Delaware, about a mile from the town of Wilmington, and about 2 m. from the Delaware river, which thus traversed it on one of its long and winding courses. It was a little town of about 300 inhabitants. A division of the American army under Washington, during the war of Independence, was defeated on the banks of the Brandywine, 11th Sept. 1777. The consequences of the battle of Brandywine was the occupation of the town by the British army. Brandywine is a town.

There are flour-mills near Wilmington that were formerly the most extensive of the kind in the U.S.; and they still enjoy a high reputation from the quality of the flour produced there. The Brandywine offers a number of favourable sites for obtaining power, which have been taken advantage of.

Brandywine is the name of a township in Chester co. Penn. (Flinn's American Geog.; Hinton's U.S.; Malte-Brun.)

BRANKA [BUCK WHEAT]

BRANTÔME, the common designation of the French writer, Jean de Bonneval, called the 4th Abbot (Abbé du Barou, ou Seigneur de l'Abbaye) of Brantôme, in Guinnes. Very little is known of the life of Brantôme, beyond the brief and general sketch given by himself in an epitaph which he left to be inscribed on his tomb. He was a younger son of an abbot and distinguished family of Perigord, where he appears to have been born about the year 1527. Having served his apprenticeship in arms under Francis of Guise, he eventually obtained two companies of foot from Charles IX. That king, with whom he was a great favorite, made him a senator in the commune of St. Michael. That of Habito de Christo was bestowed upon him by Don Sebastian of Portugal. He is supposed to have visited in the early part of his life most of the countries of Europe, either in a military capacity or as a traveller. He lived with the sisters of M. de Valois, and in the offices of his gentleman in ordinary, and a pension of 2000 livres a year. Another dignity which he held was that of chamberlain to M. de Alcôncon. After the accession of Henry III., by whom he intimated that he was not held in the same estimation as in the days of his young king, he appears to have taken his leave of the court, and retired to his estate of Richemont in his native province. It is supposed to have been after this that he wrote his various works. He is said to have been of a nature that inclined him to the 15th (the Biographie Universelle) says the 3rd of July, 1614.

By his last will he charged his heirs with the publication of his works, or memoirs, as they are often collectively called, ordering that the necessary funds should be provided from his estate, and though he has known, he adds, the booksellers pay for literature to their cost, not half so interesting or so likely to be well received by the public. They did not, however, appear till the year 1666, when they were printed in eight duodecimo volumes; according to Joly de Leyden and John Sambux, the younger; but in reality, it is said, as by Henry Steucker. The Biographie Universelle, erroneously we suspect, describes this edition as consisting of ten volumes, as dated 1666-67, and as printed by one of the Éditeurs de la rue St. Dominique. But these volumes consist of places which were sent to the press by Claude de Bourdelle, Comte de Montréal, grand-nephew of the author. Another edition appeared in 1699, and another in 1722. But the most complete edition of Brantôme is that of 1740 (not 1740-41, as stated in the Biographie Universelle), in fifteen volumes duodecimo, which bears the impress of the Hague on the title-page, but is said to have been actually printed at Rouen. No printer's or bookseller's name appears. The editor, who has appended some explanatory notes, was, according to the Biographie Universelle, a Dr. de la Freide, in the rue St. Dominique; but we believe incorrectly, attributes the edition to Prosper Marchand. A reprint of it in the same number of volumes appeared in 1779 at Maastricht (but with the impress of London); and it was once more reproduced in eight volumes, with a new edition at the same place. 'Mémoires pour servir à l'Histoire de France.'

Of the fifteen volumes, the first contains 'Les Vies des Dames Illustres Françoises et Etrangères,' the second and third, 'Les Vies des Hommes Illustres et Grands Capitaines Etrangers;' the fourth and fifth, 'Les Vies des Hommes Illustres et Grands Capitaines Françoises; ' the sixth, seventh, eighth, ninth, and tenth, 'Les Vies des Hommes Illustres et Grands Capitaines Françoises;' and the eleventh, 'Le Discours sur les Ducs.' The remaining seven volumes contain memoirs which had not been previously published. The twelfth contains a collection entitled 'Rhodamentes et Gentiles Rencontres Espagnolles,' which is stated to have been written by Brantôme in Spanish, and translated into French by Marc du Moulin. It is dedicated to Charles IX. and to the Duchess of Parma and Jurespulos Escapngolos, the other 'Sur les Belles Retraites d'Armées de diverses Nations.' The thirteenth contains the author's 'Opuscules Divers,' seventeen in number, the last being his Testament, a very curious document, and of a masonic nature. This last volume is entitled 'Maxims et Avis du Maniement de la Guerre,' by André de Bourdelles, Brantôme's elder brother. The letters of André to Charles IX., Henry III., and their mother Catherine de Medici, with their answers, form the fourteenth volume of the collection; and the fifteenth is filled with a history of the family of Bourdelles, principally taken from Dinet's 'Thétâtre de la Noblesse Française,' and brought down to the time when the edition was published. In the course of this long genealogical detail there is given a life of Brantôme, which fills about eighty pages. His portrait is prefixed to the volume.

There is no English translation either of the whole of Brantôme's works, or, as far as we are aware, of any part of them. This is no doubt to be accounted for from the comparatively late date at which they appeared; had they been published half or two-thirds of a century earlier, it is probable that the extreme freedom of expression in which they abound would not have shut out Brantôme from our literature, any more than the same objection has debarred the public from catching a glimpse of the history of the Rabelais and Montaigne. In this respect, as well as in others, his 'Mémoires' afford us undoubtedly the most living picture that has been preserved of the age in which he lived, and of the odd system of manners and of moral and personal generalities, which the Brabantniers of the time may be gathered from more formal historians can convey the vivid impression which this writer's whole style and tone of sentiment give us of the entirely different light in which licentiousness in both sexes was then viewed from what it is in our time. The character of Brantôme's head that either man or woman can be considered disconsouerred, or have forfeited a character for virtue, by the most lavish indulgence in what he calls gallantry. The most abandoned of the female worthies has a halo about her that the most illustrious ladies and good Christians. So complete is his abstinence from every expression that might denote a sense of there being any thing to blame in the indulgences which he has recorded, that he has been suspected by some of the ecclesiastics of his writing things that were not in the least like the real religion and the way of undermining the belief of his readers in the common distinctions between virtue and vice. This however is probably an unfounded hypothesis. It can hardly be said that Brantôme's moral creed on the subject of gallantry, strange it appears, was more that of the theatre than of the church generally in fashion when he wrote, and had been so for ages before. He is not more lax in his judgments upon matters of this kind, for instance, than his predecessor Rambler, or, as we have already observed, than his contemporary Montaigne. In his high, manly, and dignified manner and style, and the agreeable mixture of sightly, upright, and thoroughly Christian virtues that Brantôme writes with warm and eloquent enthusiasm.

BRASENOSNIE COLLEGE, Oxford. The precise date of the foundation of this college is not known. The plan for it was conceived in 1567-8. The Earl of William, bishop of Lincoln, and Richard Sutton, Esq., afterwards Sir R. Sutton of Prestbury, in Cheshire, a member of the privy council to King Henry VII., and in 1508 they obtained a charter from Queen Mary authorizing the building of two of the old halls of Oxford, Brasaenose Hall and Little University Hall, with their gardens and appurtenances, for the term of ninety-two years, at the annual rent of 3l.; and it was not until the expiration of the above lease that an equivalent estate was granted to University Hall, and Brasaenose College obtained the feuhold. On his death the college took its name, of warm and eloquent enthusiasm.
same name, which was unquestionably owing to the cir-
cumstance of a nose of brass affixed to the gate. As the
hall must have had a name before it got one from this cir-
cumstance, perhaps we may conclude that the name Brasno-
se was given it by the monks of Stow. It appears that a socie-
ty was formed almost as soon as the college was projected. We find a principal in the month of June, 1510. The charter of foundation granted to Bishop Smyth and Richard Sutton, Esq., is dated Jan. 15. 1510 and was confirmed 14. 1512. This charter had been a permanent corporation on the feast of St. Hugh, Nov.
17th, 1512, or perhaps a little earlier. According to the
charter, the society was to consist of a principal and sixty
scholars, to be instructed in the sciences of sophistry, logic,
and philosophy; and afterwards in divinity, and they might
possess lands, etc., to the yearly value of 300l. beyond all
burdens and repairs. The number of fellows, however, was
not completed until their revenues, by being laid out on
land, began to be certainly productive.

The estates which Bishop Smyth bestowed on the college
were chiefly two: Basset's Fee, in the environs of Oxford,
which formerly is supposed to have belonged to the Basset's
barons of Headington; and the entire property of the sup-
pressed priory of Cold Norton, with its manors and estates
in Oxfordshire and Northamptonshire. It was sold to the
Bishop Smyth, by the conveyance of St. Stephen's, Westmin-
ster, for eleven hundred and fifty marks.
The estates given by Sir Richard Sutton were, the manor of
Burgh, or Borow, or Eardborowe, in the parish of Som-
erset, Herefordshire; and the manors of Chilton, in the
same parish and neighbourhood; an estate in the parish of
St. Mary-le-Strand, London, which in 1673 was sold to the
commissioners for enlarging the streets after the great
fire, for the sum of 1700l. and with this an estate was pur-
chased in Oxfordshire, at Elmesford, near Cowley, Oxford,
which was subsequently exchanged for other lands at Stan-
ford, in the Vale of White Horse. Sir Richard Sutton gave
also the manor of Cropredy, in the county of Oxford, and
certain lands there, and an estate in North Ockingdon, or
Walton, Essex.

In the same year, by indenture with Sir Richard Sutton,
the society agreed to keep an anniversary for ever for Bishop
Smyth and Sir Richard Sutton, on the days of their re-
pective decease. Sir Richard Sutton's last benefaction to the
college, except that of St. for building a wall, was an
estate in Garsington and Cowley, in Oxfordshire, of which
he put the college in possession in July, 1592.

Bishop Smyth composed a body of statutes before the year
1513, but they are not now known to exist. In his will he
created no more benefactions than those of correcting and
amending these statutes; and accordingly a new code, signed
and sealed by four of his executors, was given to the
college, and is still preserved. In the year 1521-22 it
underwent a complete revision, and was ratified by the seal
of the society then in the hands of John, second Bishop of
Lancaster. This code, now long since superseded, is still
over a transcript only remains. In forming these statutes
considerable use was made of those of Magdalen College,
which had been borrowed from Wykeham's statutes for
New College.

In these last statutes the college is recognised as com-
monly called The King's Haule and College of Brasen-
ose, in Oxford, to consist of a principal and twelve fellows,
al, of them born within the diocese of Coventry and Lich-
field; with preference to the natives of the counties of Lan-
caster, and to the men of Brasenose and Chilton, or the
special parish of Prescot in Lancashire, and of Prescot in
Cheshire. Besides those twelve, there were to be two
fellows, masters or bachelors of arts, natives of the diocese
of Sarum, or Hereford, agreeably to the intent of a compo-
sition between Edward Audley, bishop of Salisburg, and
the College, for that purpose; but for some reason, not now
known, this benefaction never took place.

In addition to the bounty of their two founders, this
society soon obtained numerous benefactions. The first
permanent benefaction was that of Edmund Morley of
Withington, Lincoln, dated Nov. 8. 1541. Sir Richard
Sutton, at her request, had settled on the college in 1512
the manor of Pinchapel, &c., in Berkshire. John Wil-
liamson, clerk, gave 200l. in 1521, to purchase lands for
the maintenance of two fellows. John Elton, alias Beale,
canon of Salisbury, founded another fellowship in 1526.
William Porter, who had been warden of New College,
founded a fellowship in 1531. Edward Darby, archdeacon
of Stow, left 120l. to purchase lands, &c. for the main-
tenance of a fellow in 1538. In the same year Dr. William
Clyton also gave lands for the maintenance of a fellow.
Another fellowship was settled on the college by Brian
Levick, in 1529, on condition to be held in the gift of the
Archbishop of Canterbury, and of the Dean and Chapter of
Salisbury, without the city of Salisbury. This fellowship
had the patronage of the See of Sarum.

It appears that for the first time in 1654 for two scholars born in Prescot, or in the diocese of Chester or Lichfield; and in defect of such, 'any 50 persons born in the king's dominions.' John, Lord Mordaunt, in 1601, founded three scholarships. Of Alexander Nowell, the learned dean of St. Paul's, it has been observed, that he came to this college in the thirteenth year of his age, resided thirteen years, founded thirteen scholarships, and
died on the 13th day of February, 1601-2, at the advanced
age of ninety-five. Joyce Frankland, before mentioned,
James Binks, alias Stoddard, George Palyn, Dr. Samuel
Radeliffe, John Millward, John Cartwright, Esq., of Aynho,
Anne Walker, Hugh Henley, Thomas Church, Richard
Read, Sarah duchess dowager of Somerset, Dr. Thomas
Yate, William Hulme, Esq., Dr. Brunner, the provost
and others, have either founded or augmented scholarships
and exhibitions.

The scholarships founded by the Duchesses of Somerset
amount at this time to twenty in number. They are appro-
nimated to at the present time, those of the counties of Man-
chester, Marlborough, and Hereford, with a permission to
the society, in respect of four, to accept of birth in the
counties of Hereford, Lancaster, and Chester as a qualifi-
cation, in defect of candidates educated in those schools.
Mr. Hulme's foundation, by a deed of 1628, made it a
right of the society to have the benefit of it, while it had
the care of certain trustees resident in that neighbourhood,
for the support of four poor bachelors of arts, for a period
of four years from the date of that degree. Some of these
lands having been subsequently built upon, Brasenose-street (Man-
chester) stands almost as it did a year, a part of the
property greatly improved in value, the trustees, who are noblemen
and gentlemen of the counties of Lancaster and Chester,
have been incorporated by act of parliament; whereby they
have obtained a power of purchasing advozsons, and pre-
senting to the livings. They are bound however to present
such priests as are, or have been exhibitioners upon Mr.
Hulme's foundation. The nominators to the exhibitions
are the warden of Manchester and the rector of Prestwich
and Bury in Lancashire, for the time being; who again can
nominate no more but members of Brasenose College. The
part which the society take in the foundation is only to
supply objects for the founder's bounty, and to name the
lector in divinity. The advozsons which have been pur-
chased are entered in the college list, as the most conve-
nient mode of procuring the current stipends. The college
exhibitions are now fifteen, exceeding 100l. per annum
each; and the sum of 351. is annually expended in the pur-
chase of books for each exhibition.

In addition to these and various other minor benefactions,
benefactions have also been obtained, since the foundation
of the college, in philosophy and humanity, in Greek, in
Hebrew, and in mathematics.
The actual society of Brasenose College at present con-
sists of a principal and twenty fellows. There are also
three scholars of the college, not members, resident and non-
resident, upon the college books, according to the Oxford
Calendar of 1835, is 306. The Bishop of Lincoln is their
visitor.

Among the more eminent members of this college were
Laurence Nowell dean of York, Fox, the martyrologist,
Sir Henry Savile, Sir Henry Spelman, Browne the
mathematician, Humphrey Lluyd the Welsh historian, Sir
John Stradling; Eredwicke and Sir Peter Leycester the
Cheshire antiquaries, Lord Chancellor Egerton, Robert
Burton, author of the 'Anatomy of Melancholy,' Sir Wil-
lkinson, clerk, gave 200l. in 1521, to purchase lands for
the maintenance of two fellows. John Elton, alias Beale,
canon of Salisbury, founded another fellowship in 1526.
William Porter, who had been warden of New College,
founded a fellowship in 1531. Edward Darby, archdeacon
of Devon,' and Dr. Whitaker, the author of ' The
History of Manchester.'

The ecclesiastical patronage of this society consists of
thirty rectories, two chapellies, and a lectorship, producing
in all an income of about 13,439l.
The original edifice of Bishop Smyth and Sir Richard
Sutton is still visible in the large entrance quadrangle; but
a third story was constructed over a great part of it, with
dormer windows, &c., about the time of James I., for
the accommodation of additional members. The hall and tower
gateway however retain much of their former grandeur and
picturesque effect; and all the deep recesses, crenellations and
parts of the latter might be restored by Loggan's print of 1675; at
which time it appears to have been in good preservation, and
the tracery of the windows entire. At that date, and till the
year 1770, the lodgings of the principal were on each side of
the hall, one above the other, and the servants in the cellarage.
The present frontage of the college occupies nearly
the whole of the western side of the Radcliffe-square; and
the site of it, including the principal's house, extends southward
as far as the High Street.

The hall, or refectory, on the south side of the principal
quadranlare, is lofty and well proportioned. Its windows are
partly embossed with the arms of the founders and
benefactors, whose portraits also adorn the walls. Among
them are those of Sir D. D., of D., and Sir D. B., of D.,
the principal at the time it was erected, contributed 1850l.
to the building.

The contents of the Old Library, which stood at the
north-west corner of the large quadrangle opposite the
original gateway, were removed to the refectory, built
between the cloister, between the chapel and the south side of
the inner court, and finished in 1663. The design of this building
is attributed to Sir Christopher Wren; the interior was
refitted under the superintendence of Mr. Wyatt, in 1780.

The Radcliffe Library, Ashmole's bequest, is not
mentioned. But as it was selected in 1822, it is the foundation
from the superintendence of the college. (Wood's Colleges and
Halls of Oxford, by Gutch; Charterhouse the Founders of Brasenose
College, 8vo., Oct., 1890; Chalmers's Hist. of the Colleges and
Oxford University Calendar for 1835.)

BRA'SIDAS. The first mention of this eminent
Spartan occurs in the first year of the Peloponnesian war, in
which he performed a very gallant action in throwing him-
self at the head of a body of troops into Methone when
besieged by the Athenians, and for his exploit was the first
that was praised at Sparta in this war (Thucyd., ii. 25).

In the third year of the war he was associated with Cleomenes in
the battle of Pylos, where the Peloponnesian fleet was present in the
second battle in which the Lacedaemonians were defeated by
Phormion, and took probably a leading part in a well-
contrived scheme for surprizing the Athenian port of
Pylos. He is said to have taken the courage of the
thracians from the want of due exertion in execution (ii. 82—94).
The year following, in his fifth year he was associated with Alcidas in the command of the
Peloponnesian fleet. In the seventh year he commanded a ship in the armament which attacked the fort of Pylos. He was, however, somewhat fortunate while
active, distinguishing himself by superior bravery and, being severely wounded, and fainting, he dropped his shield into the sea, which was picked up and made prize of the Athenian trophy. This little incident is worth relating, because the loss of the shield was considered
a disgraceful. It does not appear that Brasidas suffered in
reputation from this accident (iv. 11, 12).

Soon after a request for help was preferred to Sparta by some from the Chalcidic peninsula, which had thrown off the yoke of the
Megarian league, Sparta, to which Athens. Brasidas was already so well known, that
the Chalcidians requested that he might be the leader of any
force which should be sent to their assistance; and the text of
Thucydides (iv. 89) seems to indicate that no one con-
tested his advantage in the command of such an
enterprise. The Lacedaemonians gave him 700 heavy-
armèd foot; the rest of his army, consisting of Pelopon-
sian mercenaries, he was collecting in the neighbourhood of
Sicyon, where he had the opportunity of protecting and
preparing for the operations of his army. The city of Megara was attacked by an Athenian army (iv. 70—74). This
campaign was in the eighth year of the war. In the same summer he led his army of 1700 heavy-armed foot (containing altogether about 4000 soldiers) to Macedonia. One chief
difficulty of the undertaking was to reach the scene
of action. The Athenians commanded the sea, and the
land route lay through Thrasyllus, a difficult and an
unfriendly country. But by the assistance of a few principal
Thessalians, who acted as his guides, and by the decision,
rapidity, and address of his general movements, he eluded the
difficulties which he had reason to apprehend, and reached the
Macedonian frontier.

We can only give an outline of this expedition, which is
but one episode in the Peloponnesian war. The thing chiefly
to be remarked is the manner in which the invasion was
paralleled with the haughtiness and severity usually manifested
by Spartan commanders towards their subject allies.
Thucydides observes that Brasidas did the Lacedaemonians
great service by his equity and moderation, which at that
time indicated many cities to be won for the cause of the
Spartans, even after the Sicilian war, 'the wisdom and virtue
of Brasidas, to some known by experience, by others belie-
ved upon report, was the principal cause which made the
Athenian confederates affect the war.' It is supposed that he
would have been the first foreign commander (i.e. first in this following list) esteemed in all points for a worthy man, he left behind him an
assured hope that the rest also were like him (iv. 81).

The first fruits of his appearance in Chalcidice were the
revolt of Acanthus and Stagirius from Athens; and
this success, before winter was completely set in, was followed
by the acquisition of Amphipolis on the Strymon. This
was the heaviest loss which could have befallen the
Athenians, inasmuch as it was the most important of their Thra-
chian possessions; it furnished them with a considerable revenue, and plenty of timber for shipbuilding, whilst the soil of Attica did not supply.

After the capture of Amphipolis, Brasidas meditated
building a fleet in the Strymon, and he requested reinforce-
ments from Sparta. When his request was denied, he
had to have sent. But these were denied, partly because the
leading men were jealous of him, partly because the govern-
ment was intent on concluding the war, and obtaining the
freedom of the Lacedaemonians made prisoners in
Sicily; and the following spring, in the ninth year of the war, a truce was concluded, which pro-
vided that each party was to retain what it then possessed.
It became a question however to which of them Scione, which had surrendered to Brasidas just about the ratific-
ation of the truce, belonged, each desiring to have it up to the Athenians. In this he was wrong, according to
Thucydides, who says (iv. 122) that Scione was in the hands of the
Athenians when the truce was signed, and two days afterwards; but he probably was ill pleased with the negoti-
ations, and the Athenians. It is said that he
had already inflamed the people of Scione to force
the truce, led to the continuance of hostilities on the
coast of Thrace. The Athenians passed a savage decree to take
Scione and put to death the inhabitants, and sent Nicias
and Nicostratus with an army to enforce it. The year passed
without any decisive occurrences; but this superior
force was not overawed by superior numbers, or
influence of the Athenians, which were about equal. But this superiority was not overawed by superior numbers, or
military weights. His military talents were useful in the
prosecution of the campaign, and the enterprise was
accomplished by the difference of talent in the generals. In short,
Nicias was puzzled; and Brasidas, who watched his
movements, was able to take advantage of a false
move, his force; he sought the battle, in which the
Athenians were completely defeated, but he himself received a mortal wound. He was buried in the public-place of
Amphipolis at the public expense, was worshipped as a hero,
and, as a still higher mark of respect, it was ordained that he
should be called Agathon the Athenian, should hence-
forward be honoured as the true founder of the city and
city.

If Brasidas had lived he probably would have become
one of the most remarkable men in the history of Sparta.
His military talents were useful as a statesman to
politics and concilia-
tory; his accomplishments considerable, at least in
Sparta, for Thucydides pitifully observes that, 'for a Laced-
aemonian, he was not unable to speak' (iv. 84). That
he was held in high respect throughout Greece may be
gathered, not only from the testimony of Thucydides above
quoted, but from the expression put into the mouth of Alci-
biades by Plato, in the 'Banquet,' that 'such as Achilles
were, they say Brasidas has been.'

BRAS. As an article of commerce, copper and
zinc, which has been known and used from the remotest ant-
iquity; it is now extensively employed both for useful and
ornamental purposes.

The direct method of forming brass is by melting together its
components; but it was manufactured long before zinc was
obtained in its metallic form. Calamine, an ore of zinc,
was mixed with copper and charcoal, and the zinc being,
by the well-known action of the carbonaceous mat-
ter, reduced to the metallic state immediately combined with
the copper, thus forming brass. In Germany brass appears
to have been made for centur-
ies before the manufacture was introduced into England:
this is stated to have been done by a German, who esta-
lished works at Esler in Surrey in the year 1649.

When the requisite furnaces have been erected, the next
step in the process is that of reducing copper to a conven-
tient form for ensuring its ready combination by extending
its surface. This is effected by pouring the melted metal
into water; by which process what is called shot copper is ob-
tained, in pieces varying in size from that of small shot to
that of a bean. The next process is to prepare the calamine, which is a
carbonate of zinc. This is first broken into small pieces, and
then heated to redness in a reverberatory furnace. In this
way the carbonic acid and the metallic zinc are obtained. One ton
of calamine is generally diminished to about twelve cwt., and
it is when cold reduced to a fine powder and washed.

The materials being thus prepared, 45 pounds of the shot
copper, 60 pounds of the powdered calamine, and a quantity of
powdered charcoal equal to it in bulk, are carefully mixed
and put into eight earthen crucibles, this being the number
placed in each furnace, made of a peculiar form. There
is also commonly mixed with these ingredients a quantity of
scrap brass. When the fires have been continued for about
seven or eight hours, the operation is finished. Supposing
40 pounds of scrap brass to have been added to the above-
mentioned quantities of the ingredients, a plate of brass is
obtained by pouring the metal into granite moulds, which is
generally about 24 ft. in length and weighs about 108 pounds.
This plate is used for rolling into thin sheets called latten. Very frequently the metal is poured into
cast-iron moulds, by which bars about eight inches in length
are obtained: these bars are employed by those who cast brass
into small goods, or who mix it by melting with additional qualities, sometimes containing different shades of colour, as tombac, pincheek, &c. Sometimes blende, or the sulphuret of zinc, is employed instead of cal-
amine; it is first roasted to dissipate the sulphur, and there
remains an oxide.

It is stated that brass is now sometimes made by the
direct union of the metals; but this process requires
great caution, for if the heat be too suddenly applied, or if
't be raised too high before the metals begin to unite, then
the zinc, on account of its great affinity for oxygen, burns,
and thus not only is loss occasioned, but the quality of the
product is injured by it, owing to the deficiency of zinc.

Brass for various purposes is made of different proportions
of the two metals, and consequently possesses different qua-
lities; its general properties are, that it has a well-known
fine yellow colour, is susceptible of receiving a high polish,
and so ductile and malleable that it may be worked at
high temperature it is brittle. The specific gravity of brass is
greater than that deducible from the specific gravities of the
two metals which constitute it, as shown by the following
statement.

Brass, containing copper 70 and zinc 30, would give a
calculated specific gravity of 8.399; but by experiment it is
found to be 8.443: when the proportions are copper 80 and
zinc 20, the specific gravity is 8.923; and when the propor-
tions are copper 90 and zinc 10, it is 8.960. On comparing the composition and density of dif-
f erent kinds of brass, it appears that the density increases
with the proportion of copper, as might indeed be expected,
and that it is sometimes even equal to that of the copper itself.

Brass is more fusible, sonorous, a worse conductor of heat,
and harder than copper. It is readily turned in a lathe,
and is consequently well adapted not only for philosophical
instruments, but those used in manufacturing processes and
for domestic purposes. In the state of wire it is most ex-
tensively employed in pin-making, and for various other
purposes; the thin leaves into which brass is made by ham-
mering are called Dutch metal or Dutch gold.

Authors differ widely as to the best proportions of copper and
zinc for making brass. It is stated, in the supplement to the
'Encyclopaedia Britannica,' that one part of copper and
two parts of zinc are the best proportions for common brass;
and that one part of each forms prince's metal of a fine yel-
low colour. Mr. Parkes, 'Essays,' p. 210, states (and we believe
he obtained his information from an accurate source) that
the most useful proportions are one part of copper and
two parts of zinc; which are not far from the equivalent of each
metal. Berthier's analysis of the brass wire of Jeunemars
confirms the probability of this statement, for he found it to
consist of

| Copper | 65'15 |
| Zinc   | 34'85 |

The small quantity of lead is of course to be regarded as an
accidental admixture. According to Dr. Thomson, also,
Bristol brass consists of

| Copper | 65'15 |
| Zinc   | 34'85 |

Some old Dutch brass, analysed by the same chemist,
which he states was much approved of by watchmakers,
yielded

| Copper | 72'55 |
| Zinc   | 34'45 |

In concluding this article, we shall give the method of
analysing brass proposed by Mr. Keates, in the 'Annals of
Philosophy,' vol. iii. p. 326.

Dissolve the brass in dilute nitric acid, add a little sulphu-
rlic acid and evaporate to dryness, redissolve in excess of
dilute sulphuric acid, dilute the solution and boil pieces of
polished iron in it, until the solution becomes nearly colour-
less, filter it while hot, wash the precipitated copper with
dilute sulphuric acid, and afterwards with boiling water:
this when dried is to be put into a crucible, covered with char-
coal powder and melted; the copper being cleansed from any
adhering charcoal, is then to be weighed.

The filtered copper, from which the copper has been
separated, is to be boiled with nitric acid to peroxidize the
iron; neutralize the acid with carbonate of soda, and precipi-
tate the iron by ammonia, using an excess of the latter so
as to redissolve the oxide of zinc at first precipitated; filter
the solution and wash the precipitate with cold water, which
is then to be dissolved in a dilute nitric acid, and the
bodilessness and heat the dry mass in a platina crucible; to drive off
the muriate of ammonia, dissolve the residuum in dilute muriatic acid,
and precipitate by carbonate of soda; the precipi-
tate, after being washed and dried, is heated to redness:
40 parts of this precipitate are equal to 32 parts of me-
talllic zinc.

Another and more simple method is the following:--
Dissolve the brass in a considerable excess of nitric acid;
pass sulphured hydrogen gas, also in excess, through the
solution. The copper is then precipitated, which is to be
treated with nitric acid, and so separated by filtering,
and the peroxide of copper precipitated by boiling with soda;
80 grains of this precipitate indicate 64 grains of copper.

The solution remaining after the separation of the sul-
phured copper is to be boiled to drive off the sul-
phured hydrogen, and then precipitated by carbonate of
soda: the precipitate, when ignited, is oxide of zinc, 40 grains
of which indicate 32 grains of metallic zinc. (Smith in
Lond. and Edin. Phil. Mag. vol. viii.)

BRASSICA, a genus of Cruciferous plants, comprehen-
ding among other species, the cabbage, cauliflower, broccoli,
borecole, rape, turnip, colza, and the like. As these are ob-
jects of horticultural or agricultural interest only, they will
be spoken of under their respective heads. We shall in
this place consider Brassica in a very wide point of view
only. It is distinguished from other Cruciferous genera
by the following characters:--Its seeds contain an embryo,
the radicle of which is embraced in the concavity of the
folded cotyledons. Its pod is long, slender, and many-

No. 316 [THE PENNY CYCLOPEDIA.] Vol. V. a 2
seeded. The seeds are spherical. The calyx is equal at the base and slightly spreading; the petals are undivided; the stamens entire. In its wild state the cabbage (Br. oleracea) is met with in abundance upon the cliffs of many parts of Europe; commonest in Italy, Spain, and Portugal. Cape Town, Cape of Good Hope, Mount Athos, on the coast of Kent near Dover, and on that of Cornwall, Wales and Yorkshire. In other places it forms a broad-leaved glaucous plant, with a somewhat woolly stem, having but slender likeess to its cultivated progeny; and it is difficult to conceive by what original discovery the species was brought under the influence of domestication so as to have been prepared for the numerous changes and improvements it had to undergo before the races of cabbages, savoys, borecoles, cauliflowers and broccolis could be developed.

Swedish turnip is supposed to be Br. campestris in a cultivated state, a plant with somewhat hispid, lyrate, glaucous leaves, found wild in the S.W. parts of Europe, and apparently also in many parts of England, by the sides of rivers, by ditches, in marshes and elsewhere. It is believed to have been the Foyylaexist (gongylis) of Theophrastus.

Rape, Br. Rapa; Colza or Colesseed, Br. Napus, are other species the native country of which is unknown. Common turnips are considered by botanists to be cultivated varieties of the former. With some it is a matter of doubt whether the whole of these supposed species are not mere varieties derived from one common stock, in consequence of their intermixing so freely with each other that it is extremely difficult to keep their races truly distinct.

The westernmost islands of the Cape Verde Islands, lies eight miles to the W.S.W. of Fogo. The island is high, and its mountains rise one above another like pyramids, though, compared with Fogo, it appears low, and its summits are generally covered by a dense atmosphere. The climate is temperate and healthy. The soil of the island is sandy, producing a large quantity of Indian corn, beans, and all sorts of refreshments, but little wood. There is also an abundance of salt, and more saltpetre is procured here than on any of these islands. Brava has several bays and roads, but none safe. The tomb of a race of men is called Fogo, and lies at the N.E. end of the island, where small vessels may lie sheltered from all winds but the S.W. Along the whole coast there is generally a heavy surf, and landing is bad. It is only frequented by small vessels from the other islands for archi, grain, and salt. The natives are few, and all blacks. They are harmless, hospitable, and generous.

To the N. of Brava, about five or six miles, are two rocky islets called Rombo, or Rames Islands, which are connected with each other by a reef, but the passage between them is not clear. The island is nearly oval, six miles long north and south, and about four miles broad. The south point lies in 14° 46' N. lat. 24° 45' W. long.

(From Plundres and Krusenstern's Voyages; Voyage of the Lenangen.)

BRAVURA, in music (Ital. courage, intrepidity), an air consisting chiefly of difficult passages,—of divisions, in which many notes are given to one syllable, therefore requiring great spirit, much bravura, in the performer. (See, under the word AIR, Air de bravura.)

Compositions of this sort have, generally, no object but the display of the singer's force, volubility, and distinctness of articulation; though some few fine air of the kind, by Handel, Hasse, Piccini, Guglielmi, Cimarosa, Mozart, &c., still remain in evidence. This style of music has thus far inferior works in the same style continue to be tolerated.

BRAUNSBERG, a minor circle of the circle of Königsberg, in the prov. of Eastern Prussia. Its area is about 374 sq. m.; it is traversed by the Passarge, a riv. of some note, whose tributaries, the Walsh and Drownitz, also irrigate it; and though it contains extensive tracts of forest, it is well adapted for the growth of grain and flax, both of which are raised in considerable quantities. Besides this source of good crops it possesses good harbours and fertile lands on the Frische Haff, produces much timber, rears cattle, and manufactures linen yarn, linens, woolens, leather, &c. It contains 4 towns, 176 vill., and 172 par., and in 1831 had 93,949 inb.; in 1826, 35,934. The seat of local government is at the town of Passarge. Within about 5 miles of its efflux into the Haff, in 64° 19' N. lat., and 19° 54' E. long.: it is divided by the riv. into the old and new towns. The bishop of Ermeland (a dist. which was formerly composed of the circles of Braunsberg and Heilsberg) has his residence here; the old castle is used in part for public offices. Braunsberg possesses a lycæum, with faculties of Roman Catholic divinity and literature. The churches are Roman Catholic, the majority of candidates for the priesthood, a normal school for educating teachers, 4 Roman Catholic churches and 1 Protestant, an asylum for 12 widows, and 3 hospitals. The number of houses is about 700, and its pop. in 1831 was 7141, showing an increase of 446, or 6·5% in 15 years. Woollens and linens, as well as leather, are manufactured; the trade of the town consists principally in yarns, grains, ship-timber, and grain. The Passarge is navigable from Braunsberg to its mouth. In this circle lies Frauenburg, on the north coast of the Dornberg, or the fort of the Dornberg on which the cathedral of Ermeland and the residences of the members of the diocesan chapter are situated. It is an open town with a church, had 2001 inb. in 1831, makes yarn, woollens, pottery, &c. The remains of Copernicus, who was a member of the chapter and died here in 1545, were deposited in the cathedral. Frauenburg is noted for a tower which once formed part of an aqueduct constructed by him. Mehlisack, another town in this circle, is situated on the Walsch, has 2 Roman Catholic churches, and had in 1831 2617 souls. It makes woollens, yarn, hats, leather, &c.

BRAUWER, or BROWN, ADRIAN, was born, according to some authors, at Oudenaren, but, according to others, at Haarlem, of poor parents. He was apprenticed to Frank of Amsterdam, where he became so incommodiously skilful, made money by his productions, that he found himself confined and almost starving at home. Brouwer excelled in painting such scenes as his irregular mode of living made him most familiar with. The singular recklessness of his conduct led his friends to fear for his future situations. It is related of him that, being in Antwerp during the wars in the Low Countries, his vagabond appearance caused him to be apprehended as a spy, and he was put in prison. So it chanced that he was imprisoned in the same cell with Rubens, and they became intimate friends, and frequently visited by Rubens. Dismissing his fellow-captive to be an artist, the duke asked Rubens to procure him materials for painting. As soon as he had them, Brouwer set to work, taking for his subject a group of soldiers playing at cards in the prison. D'Aremburg showed the picture to Rubens, who immediately recognized the work of Brouwer, and offered 600 guilders for it. The duke, however, would not part with a thing he found to be so valuable; but, keeping it for himself, presented the picture to His Highness the Elector, with a larger sum. Rubens exerted his interest, and procured the presentation of the picture to him home with him, clothed him, and maintained him for some time. But a life of quiet was not suited to Brouwer, and he quit Rubens again to plunge into excesses, which shortly after terminated his existence in an hospital, at the age of 32, in the year 1642.

His subjects are taken from low life, of the most unpleasing class; but from the extraordinary skill displayed in the execution, the excellent colouring, the correct drawing, and the life and character of the design, they fetch a high price.

BRAY. [BERKSHIRE.]

BRAY. [WICKLOW.]

BRAZIL comprehends the E. portion of S. America. Its most important point, at the source of the Rio Branco, nearly reaches 13° 15'S. and the most northern point, which divides it from French Guiana, extends nearly as far as the equator. The most southern boundary-line cuts the lake of Mirim, in 32° 30'S. lat. The most E. projection, Cape Augustinho, lies nearly 10° W. long. Brazil extends W. to the river Hyrawy or Yawary, where its boundary-line falls in unknown countries, and probably passes 70° W. long. Brazil extends from N. to S. above 2,600 m., and from E. to W. about 2,400 m.; its surface is calculated by some at 3,500,000, by others at only 2,500,000 sq. m. According to the first calculation it is about fourteen times as large as France, and probably ten times as large as France. Its vast extent brings it in contact with all the countries of South America, except Chili and Patagonia. At its S. extremity (the province of Corrientes) lies on the republic of Uruguay Oriental, or Bandu Oriental, and on the republics of Corrientes and Las Missiones, both of which are considered as part of the
federal republic of La Plata. From Paraguay it is separated partly by the Rio Parana and its tributary Ivinheims, and partly by a range of high lands which terminate on the banks of the Paraguay. The boundary-line passes that riv, and runs in a N.W. direction along the unknown river until it reaches the coast. The distance of this coast (about 13º S. lat.), by which river Brazil is separated from Bolivia as far as its confluence with the Mamoré, which latter continues to form the boundary-line up to its junction with the Beni. At this point begins the boundary-line between the two States. It is an unresolved point, and it is unknown, and is supposed to run due W. along the parallel of 11º S. lat., as far as the Hyabrady, and then to the N. along the course of this riv. to its junction with the Rio Amazonas. The boundary-line between Ecuador and Brazil extends for 65º S. lat. from the Rio Amazonas, to nearly 0º N. lat. and thence E. to the Rio Branco, a tributary of the Rio Negro. The remainder of the boundary-line runs N.E. along the mountain range which separates the upper branches of the Rio Branco from those of the Orinoco, and turns at the sources of the former to the E., extending hence along the Sierra Baracayna to the sources of the Mazaroay, where Brazil begins to border on the British settlements in Essequibo and Demerara. This boundary in all its extent is formed by a mountain-range of considerable height, called the Dutch colony of Surinam, and afterwards the French settlement of Cayenne. Where the mountain-range ceases the Rio Oyapock constitutes the boundary between Brazil and French Guiana to its mouth. On the N.E. and S. Brazil, this boundary is the Amazonas Oceanic. The coast, which is probably little short of 4000 m., presents various appearances. From Cape S. Maria in Uruguay, to the Morro de S. Marta (about 31º S. lat.), an extent of upwards of 500 m, the coast is low, sandy, and intersected by numerous branches of the river, the shores extending nearly in a straight line, in which it trends from S.W. to N.E. At the Morro de S. Marta, where it runs to the N., it begins to be rocky, but rises only to any considerable height to the N. of the island of S. Catherina. From the shore of S. Francisco it trends to the N.E. of the point of Alto, and the harbour of S. Carlos, Cape Frio, it runs nearly due E.; and thence to the bay of Espejo Santo N.E. In all this extent of nearly 1000 m. the coast is rocky, and in some parts rather high; it has a great number of indentations and excellent harbours, generally surrounded by flats of moderate extent. The most rocky and highest part is between Santos and Cape Frio. From the bay of Espejo Santo to Bahia de Todos os Santos, the shores extend nearly S. and N.; this portion of about 600 m., is in general low and level, with several branches of the river and the small river Buranhe; to the N. of the latter it commonly rises from four to six yards in height, but is generally level; towards Cape S. Antonio it sinks lower. Along this coast, in 18º S. lat. at a distance of from 25 to 30 m. extend the rocky banks of the Abrolhos; the coasting vessels commonly pass between and the shores. The coasts of the E. projection of Brazil from Cape S. Antonio nearly to the mouth of the river Parnahyba are of moderate height, rising perhaps nowhere above 30 ft., but they contain no harbours, except those formed by the mouths of the riv. This extent may be upwards of 800 m. The remainder of the shore, from the mouth of the Parnahyba to that of the Amazonas, is extremely low and marshy, a few sandy hills rising on it at great distances from one another. In this extent of about 700 m. there are few harbours. To the N. of the Rio Amazonas the coast is rather sandy and somewhat higher, though of considerable elevation. Some parts are subject to a sudden rise of the sea at spring tides, called porotoca. [Brez] This coast extends about 400 miles. The surface of Brazil is divided between upland and lowland. As the boundaries of the two regions have been ascertained only in a few places, it is not possible to give the proportions exactly; but on a rough calculation it may be assumed, that they occupy nearly equal portions, the upland extending over the E. and central part, and the lowlands principally along both sides of the Rio Amazonas, with a smaller portion on the shores, and on the S.W. border. High mountains advance nearly to the shores between the bay of Santos and Cape Frio. This range, the higher summits of which are hardly anywhere more than 20 m. from the coast, is called Serra do Mar (the sea range). The highest summits rise to about 3500 ft., and the passes of it to from 2000 to 2500 ft. This range continues to the S., but S. of the bay of Santos it recedes to about 60 or 80 m. above the sea. From here it runs down to the Rio Tocantins, where it is called the Serra de Cubatão, and runs first S.W. and then S. to a point opposite the Morro de S. Marta, where at the sources of the rio Uruguay it turns W., and advancing in that direction about 200 m., terminates on the banks of the Rio Uruguay to the N. of the junction of the Ibecuy and with it. From the S. side of this W. chain an elevated table-land extends S. between the riv. Uruguay and the shores, and continues in Uruguay Oriental, where it terminates near the vast mouth of the riv. La Plata, with the Punta Negra and Cape S. Francisco. This chain, which extends along the coast in a deep but narrow depression. At the source of the Rio Tiete, a tributary of the Parana, this range is united to the Serra do Mar by a tract of high ground. It contains the highest mountains of Brazil, which are situated where it bends more or less from the sources of the Rio Grande, the highest branch of the Parana, and the Rio Preto, a small tributary of the Parahyba. The Pico dos Ormos rises to 7786 ft., the Morro de Papagaio to 766 ft., and another summit which has not yet been distinguished by any name, to 7786 ft. The highest pass of this chain rises to upwards of 3000 ft. To the N. of Villa Rica the chain again rises and continues to the N., declining by degrees some points to the E. till it reaches the banks of the Rio S. Francisco, which breaks through the chain, where it is called Cacoeris (fall) de Santo Affonso. This chain, which had not obtained any peculiar name among the inhabitants, is now called Serra Espinhaço. It is of considerable height in its S. part, but does not attain that of the Serra Manacapuru; its highest point, the Pico de Princes, rises only to the height of the Iacutomi. In proceeding N. it sinks considerably, and hardly any summit in the prov. of Bahia rises to 4000 ft., while the passes do not exceed 1800 ft. This chain remains generally 150 m. from the coast, but its offsets in some places approach it within 20 miles. North of the great escarac of Affonso the mountains, called here Serra Arra and or dos Carybris, rise again to a considerable elevation, and form between 7º and 8º S. a table-land of considerable extent, from which several ranges of high hills are detached to the E. and N., some of which terminate at no great distance from the shore between the Rio S. Francisco and the Rio Parnaíba. The most considerable of these lateral ranges are the Serra Borborema, which extends along the coast of Rio de Janeiro, and the Serra dos Sêrâa and the Serra Ibiapiba, which constitutes the boundary between Sêrâa and Piauí. The elevation of no one point in this mountain-system, which covers the greater part of the E. projection of Brazil, has been determined by measurement, though some portion of it rises to a considerable height. From its S.W. corner a mountain-range of moderate elevation runs S.W. along the Rio S. Francisco, and then W. to the sources of the Rio Parnaíba, where it turns N., running direct to the mouth of the Tocantins, a distance of 200 m. from the Rio Tocantins, terminates with a range of low hills at about 180 m. above the mouth of that riv. Between the Serra do Pernambuco and the prov. of Piauí the passes rise to between 1200 and 1300 ft. above the sea. To the W. of the range running N. and S., and to that of the Serra Espinhaço, da Mantiqueira, and de Cubatão extends the upland of Brazil far into the interior of South America.
America, but it grows narrower as it runs W. Its N. boun-
dary is indicated by the falls in the rives, which carry their
waters to the Rio Amazonas. These waterfalls occur in the
Tocantins south of 5°, and in the Madeira south of 5° S.
latt.: a line drawn through these points separates the low-
lands of the Rio Amazonas from the upland of Brazil. It is
more difficult to determine the S. boundary-line of the up-
land; it extends from Morro de la Mesa in a W.N.W. direction
to the Salto da Vitoria, the great waterfall of the rive.
Iguassu, situated a few m. from the place where that rive.
falls into the Paraná. It then follows the course of that rive.
to the cataract, called the Sete Chutes, and so to the
sources of the Paraguay, an upper branch of a high ground
which separates the affluents of the Paraná and the
upper branches of the Tocantins and Xingui from those of
the Rio Paraguay, till it meets at the sources of the last-
mentioned rive, the Serra dos Paracis, along which it runs,
at first to the W., and afterwards to the N. W., terminating
at some distance from the confluence of the Mamoré
with the Beni. By this boundary-line the lowlands on the Par-
aguay and Guaporé are divided from the high table-lands
of the Paraná and Upper Tapajos.

The extensive space enclosed within these boundaries is
properly a table-land of considerable elevation, but an un-
even surface. It does not rise to such a height as the table-
land of Anahuac in Mexico, but it surpasses in elevation the
highest table-lands of Europe, those of Bavaria, and Switz-
erland. The central part, which is the lowest and lowest
part of the basin, is covered with a uniform plain, the
Sulina. The mountain-ranges which traverse it rise only to
a comparatively small elevation above the plain.

The highest portion of the table-land seems to lie con-
tiguous to the range of mountains which divides the upper
branch of the Tapajos and the upper branch of the Serra
dos Verdes, and which, as we have seen, separates the low-
lands of the Rio Amazonas from those which fall into the Parana
and Paraguay. This extensive range, which has lately been
named Serra dos Verdes (the watershed range), begins
about 60 m. S. of Villa Rica, at the Serra da Mantiqueira,
between the sources of the Paraguay, an upper branch of the
Rio S. Francesco and the Rio Grande, an affluent of the
Parana (about 20° 30' S. lat.) It frequently changes its
direction and makes numerous bends, but runs in general to
the N.W. and terminates at some distance from the con-
fluences of the Serra dos Verdes with the Paraguay (116 S.
latt.) in different districts it has different names. Between
the sources of the Rio Francisco and the Rio Grande it is
called Serra Cânestra and Serra Marcella, and at the sources
of the Tocantins, Serra dos Fyrinco. These, the highest
points of the Andes in Brazil, rise to 3500 m. and
upwards. The ranges farther to the W. are lower. The
Serra Seida divides the upper branches of the Araguaia, a
tributary of the Tocantins, from those of the Pardo, a con-
fluent of the Parana; and the Serra dos Paracis, the Tapajos
from the Madeira, a tributary of the N. for some miles the
latter the Tapajos from the Guaporé. The latter ranges probably
never attain 3000 ft. At the place where the Serra Paracis
turns to the N. it sends off a branch to the S.W.S. which,
after a course of about 180 m., terminates in the plains of
Chiquitos in Bolivia. This range, which is called Serra
Agoapey, divides the affluents of the Paraguay from the
Ubay, a tributary of the Guaporé, and, consequently, of
the Madeira, and seems not to rise to the height of the
Serra Paracis.

The division of Brazil which, lying to the S. of the Serra
dos Verdes, borders on the W. on the Serra Agoapey, and
on the E. on the Serra Cubatao, is divided into two por-
tions by a range of hills extending between 32° and 37° E.
long. from the Serra Seida southwards between the afflu-
ents of the Paraguay and Paraná. It enters the Paraguay
and sends a branch eastwards, which terminates at the great
waterfalls of the Paraná, called Sete Quedas. The country
to the E. of this range is the high table-land of the Paraná,
that to the W. is the table-land of the Paraguay.

The lowland of the Paraguay, with the exception of the
taper rapid descent of the enclosing mountains and a few
hills or short ranges in the interior of the plain, presents a
level country, which declines imperceptibly towards the
banks of the paraguay, where its declensions in swampy
flats many miles wide. Near the rivs. it rises gradually to high
trees, but the intervening spaces are grassy plains of
considerable extent, here and there interrupted by barren
tracts. This immense plain, which, though situated in the
centre of America, hardly attains an elevation of 1000 ft., is
extremely hot and subject to long-continued droughts, which
cause great mortality among men and cattle. The rains
commonly begin at the end of October, and continue to
April or May, and in the month of July in some parts about 4°
S. lat., are occasional, violent, and accompanied by
storms, and most abundant rains towards the end of the
season, when they cause the rivs. to overflow the adjacent
low grounds.

The principal riv, and that which is the receptacle of all
the water of the region, is the Paraguay; rising on the
top of the Serra Paracis in the Sete Lagous (seven lakes),
which are in a short distance from one another, and
communicate by narrow channels. Issuing from the last of
these lakes the riv. flows through a swampy country in a
direction with great rapidity in two channels, separated by a
rocky island of considerable length. This place, which is called
Fecho dos Morros (the barrier of rocks), terminates the
swampy and low margin of the riv. At the end of the
rainy season, when the rains are very abundant, and the
Paraguay rises, it carry them off by its narrow channels at
the Fecho dos Morros, the whole of the low ground is laid
under water, and forms a lake, nearly 700 m. in length and
from 70 to 150 m. in width, which covers a surface about as
large as Lake Superior in Canada. In September however
the Paraguay rises again, and again dries up. Then the riv.
again laid dry. This temporary lake is called Xarayes, and
indicated in some more ancient maps as a true lake. A
considerable portion of the inundated land is covered with
a kind of wild rice, on which innumerable flocks of water-
fowl, especially the Cachalote or Eagle-owl, which
passing shake off from the ears, which are always above
the water, as much as they please.

During its course through this low plain the Paraguay is
joined on the left by two considerable tributaries, the Rio de
S. Lourenço and the Tacuary. The S. Lourenço, which
rises to the E. of the upper branches of the Paraguay,
leaves Brazil and enters the republic of Paraguay.

The table-land of the Paraná, which extends on the
E. of the lowland of the Paraguay, is everywhere sur-
rounded by mountain ranges. To the W. is the chain
of mountains which, descending from the main affluents
of the Paraguay, to the N. the Serra dos Verdes, to the
E. the Serra da Mantiqueira and the Serra Cu-
batao, and to the S. a range which (about 26° S. lat.)
departs itself from the Serra Cubatao and extends W. to
the Solomon Islands, below the Salto de la Vitoria. Only in
the comparatively short space between this Salto of the
Iguassu and the Sete Quedas of the Paraná the region is open
towards the republic of Paraguay, from which it is separated
by the Paraná.
The table-land of the Paraná is very uneven along its N.E. and N. border, where the offsets of the Serra da Man- tumigueira, Serra de Canasta, Serra de Marcella, and Serra dos Pirineos extend many miles; but the remainder is a plain of great elevations and great depressions by hills of very gentle ascent and small intervening basins. The eastern and higher portion of the table-land is 2000 ft. and upwards above the level of the sea, but it is not known how much it declines on the banks of the Paraná, which runs through the least elevated portions of the table-land. Trees occur only on the declivities of the mountain ranges; and in the lower tracts along the course of the river: the forests cover probably less than one-third of the surface. The plains are overgrown by a coarse but nourishing grass, here and there intersected by large bushes and a few small isolated trees. They serve as pasture for the innumerable herds of cattle, horses and mules, which constitute the riches of this portion of Brazil. Agriculture, though in a comparatively low state, is more attended to than in many other districts of Brazil, but it is principally limited to the culture of mandiocca, maize, and different kinds of beans; rice is grown in some places and the sugar-cane on the lowlands along the rivers. Pine-apples, as well as the fruits of Europe and the vine, thrive very well. Among the fruit trees peculiar to this region is the jequitiba (C线pocarpus cal- flora, Mart.), whose fruit gives a palatable wine. In the S. district wheat and flax are grown with success. The variation in the temperature is greater than in those parts which lie near the equator; but neither the heat nor the cold is ever extreme. Wheat bread is eaten, and the interior climate of the forest is only frequent near the mountains, and never occurs in the plains. The average heat is between 60° and 70°, and even in the summer it rarely rises above 80°. During the winter the winds blow from S.W. and S.B., but in summer they are from the north and northeast. The rainy season is in October or November and lasts to April; it is most abundant in January, and then always accompanied by fog during the morning. Farther to the W. on the plains it begins later. First it rains only during night, afterwards in the day; sometimes for days and even weeks without ces- sation.

These abundant rains feed a number of large rivers, which traverse the table-land from E. to W., having most of them their sources in the ranges, which divide it from the shores: they all unite their waters with those of the Paraná. The farthest branches of that large river rise in the mountainous country, where the Serra da Mantigueira unites with the Serra de Canasta. The most distant branches of the Paraná, which rise in the ranges of the Mantigueira turns to the N., at first flows N. and then N.W. for a considerable space; afterwards it turns to the W. and continues some hundred miles in that direction, declining somewhat to the S. towards its junction with the Paranahybas. In the region of the large lakes formed by the Paranahybas tributaries, the Sapucahy, the Pardo, and the Mogi, each of which descends through the plains from the S., and runs upwards of 200 m. At the confluence with the Paranahybas the Rio Grande has already a course of upwards of 500 m, and then its name is changed into that of Paraná. The Paranahybas rises in the Serra dos Pirineos, receives in its course the Corumbá, and joins the Rio Grande after a course of upwards of 350 m. Many miles below this confluence the Paraná forms a considerable cataract, called Urubu Funge, and lower down it receives the Tebic, which traverses nearly the middle of the plains. The last-men- tioned river rises at a great distance from the shores of the Atlantic in the western declivity of the Serra de Cuibafio, and runs upwards of 400 m. Though its navigation is render- ed very difficult by numerous rapids and waterfalls, this river has till now been more navigated than any other in the interior of Brazil. Between the Pungas Urubó and the Sote Quedas the Paraná receives besides the Tiete two other large tributaries, the Pardo on the right, and the Paraguay both running a course of about 300 m. The Pardo, which rises in the Serra Caicá, was formerly much navigated in spite of its numerous rapids and falls. In this tract the Paraná forms many large islands, of which the largest are the Ilha Conpria (Long Island of the Ilhas Conpria), which is not much less than 70 m. in length and of considerable width. The Ilha Grande terminates 4 m. above the Sote Quedas (or Seven Falls). Below the S. extremity of the Ilha Grande the Paraná is nearly 4 m. wide, but at the falls the bed of the river is contracted to about 50 fathoms. The immense volume of the river is then divided into seven channels, formed by six small islands of rock, and precipitated down the ledges, with a current of indescribable fury and awful noise. This is one of the greatest cataracts of Brazil; a great cataract called Salto da Vitoria, and joins the Paraná after a course of nearly 300 m. After this junction the river still runs S., then turns to the W., and falls into the sea. It is a secondary stream of the great river, which rises in a chain of mountains, is not known, but it appears to be considerable. The riv. Uruguay, which rises in the mountains near the coast, traverses it in all its extent, flowing W.N.W. and W. till it enters the plain of the Missions.

The S. extremity of Brazil, which extends S.W. of the Campos da Vacaria, contains two plains, one lying on the N.W. along the riv. Uruguay and the other on the S.E. along the sea-shore. They are divided by a high ground of the Serra dos Tapés. The surface of the high ground extends in spacious and nearly level plains, here and there interrupted by small hills. This upper part is entirely without trees, and covered only by coarse grass and bushes; but on the river and its tributaries the vegetation is more varied. The high ground, many fine trees occur. The valleys are also the only places in which there is any agriculture, and this is nearly confined to the raising of wheat and maize.

To the N.W. of this high ground extends along the banks of the rif. Uruguay, a swampy and marshy district, which received its name from the seven missions established here by the Jesuits. This plain is very little known, but seems to be well adapted to the cultivation of different kinds of grain, as well as of cotton and of mutton or tea of Paraguay. The riv. Uruguay, which forms its north-western boundary, and divides it from the Missions de La Piata, is here navigable in all its extent, though it has some rapids. The plain along the sea-shores extends from S.W. to N.E. upwards of 200 m., with an average breadth of between 50 and 100 m., and finally converges towards the S. and imperceptibly towards the high ground on the west. Its soil towards the coast is sandy, with a substratum of clay, and produces grass, but no trees. Farther inland the soil is better, but the country still without trees. The most remarkable lakes are those of the large lakes, called Laguna de los Patos, one of the largest in South America, which took its name from a tribe of Indians. It extends 150 m. in length from S.W. to N.E., and at its greatest width, so that it there occupies about half of the plain. It has suffi- cient depth for vessels of a middling size, but some very dangerous shoals. The water is salt in the southern part. It is the recipient of almost all the currents that traverse the plain, and receives, about 12 m. from its northern ex- tremity, the Iacuhy, a winding riv., which rises on the northern extremity of the large lakes, and which is well adapted to agriculture. About 15 m. from its embouchure, the Iacuhy forms a spacious bay on its eastern margin, on which the town of Fortaleza is situated. At the S. extremity the mouth of the lake opens into the Bay of St. Goncalo, which is properly only the outlet of the lake Mirim. This riv. is about 50 m. long, wide, and navigable. The S. part of the lakes Mirim and Manguiera belongs to Uruguay, [BANDA ORIENTAL].

The lake lake Uruguay rises its waters into the sea by the Rio Grande de St. Pedro, which flows about 10 m. almost N. and S., and is nearly 3 m. in width. The mouth of this riv. is full of shoals, which are more dangerous as they are subject to be frequently changed by the tides. The climate of this region is more temperate than the ?7; enjoys a temperate climate like that of Spain or Italy; the air is pure and healthy. In the valleys and on the plain, frost very rarely occurs: on the high ground it is annually felt for one or two months; but as very little snow falls, the
cattle and pasture all the year round. From May to Oct., the rains are abundant.

The low country between the shores of the Atlantic and the first mountain range, from the Morro de St. Marta on the S. to Cape St. Antonio, near Bahia, on the N., extends in some places to within 20 m. of the sea. Along the coast, a few miles S.W. of the Rio Doce and the Bahia de Todos os Santos. In others, places the mountains approach the sea within 15 or 20 m., as between the bay of Santos and Cape Frío. North of the Rio Doce, a level country extends upwards of 60 m. inland, but to the W. of Cape Frío the hills approach so near the sea, that their lower extremity is washed by the high tides, and the traveller can only pass at low water.

Except the comparatively small tracts which have been cultivated by European settlers and their descendants, the side of this country are covered by impenetrable forests, extending even in the valleys along the banks of the rivers nearly to their sources on the high land. North of Cape Frío, the trees and plants peculiar to a tropical climate are common, but south of it they occur less frequently. The soil is in most places of great fertility, and produces sugar, coffee, cotton, and cacao, mandioces, maize, and rice in abundance.

The riv. in this tract are very numerous, but have a short course, seldom exceeding 100 m. They are generally navigable for a 60 m. franco. The banks are nearly all of them skirted by low ground, which are inundated after the rains have begun. The riv. begin to rise in Nov., and the inundation ceases in the middle or towards the end of Jan.; in some it lasts two months, in others only a month. The mouths of the rivers, formed by a soft soil, they are subject to many changes, which are produced by the variable winds and by the current prevailing on this coast. The largest of these riv. are the Paraíba, the Doce and the Rio Belmonte.

The rain on the Doce preserve their freshness for a considerable distance into the ocean, and hence it has received the name of Doce, soft or fresh.

The Rio Belmonte, in traversing a mountainous range called Serra dos Aimores, is contracted by two high steep rocky cliffs, a sudden rise of more than 120 ft. with tremendous noise into a whirlpool. Fifteen m. lower down, it has a little fall, after which it flows through a flat and wooded country to the sea, describing various windings, with a current rapid and wide but of little depth. It contains many flat islands, and receives no considerable stream after it descends the fall. About 20 m. from the sea, the Rio Belmonte is united to the Rio Patype, its nearest neighbour to the N. by a natural channel called Serrin. At this point, the Doce is joined by the Doce terceiro, and the Patype by the Serra de Minas.

This country, though mostly within the tropics, enjoys a moderate climate. In Porto Seguro the medium heat, according to Freyreia, is only 79° Fahrenheit, but at Rio Janeiro 74°, which he attributes to the neighbourhood of the rocky mountains. At the latter place, however, the thermometer sometimes rises to 90°, and in winter, to 120°. In summer (Dec., Jan., and Feb.), the average heat at noon is 86°, and in the morning 72°; and in the winter (June, July, and August), it is 72° at noon, and in the morning 59°. Another peculiarity is the great humidity, which arises probably entirely from the country being almost entirely covered with high trees and exuberant vegetation, and partly from the regular change of the land and sea winds. The sea winds come on to take its place, rarely sooner, more frequently at two o'clock, and blow till nightfall. The land winds consist of the trade winds prevailing. The effect of this great humidity of the atmosphere is that the coast of Brazil has not such a regular succession of dry and rainy seasons as other tropical countries. No part of this coast is entirely exempt from rain, though the winter is often dry and the sky cloudless; and the rains in the summer are generally very abundant, especially in January. In summer, thunder is very frequent, and always accompanied with violent storms, which, however, never cause any damage, compared with the winds and hurricanes in the West Indies. Hailstones never fall.

The Serra Espírito Santo, which bounds on the W. the country on the shore, divides them from the highest part of the table-land of Brazil. This extensive country, which extends W. of the Serra do Espírito Santo, is, as far as we know, an uneven plain, on which numerous hills, sometimes isolated, sometimes in groups, and sometimes in ranges, rise to a moderate height, commonly with a gentle ascent. Along the watercourses are depressions or valleys, but generally of small extent. The plain is at an elevation of from 2000 to 2500 ft., and the hills rise above it only a few hundred, and perhaps never more than 1000 ft. The valleys descend towards the S., where they approach the Serra de Minas, a few miles distant from the centre of the plain, but farther to the N. still more. The surface of the plain, as well as of the hills, is in some places covered with sand, and in others with bare sandstone rocks, but it is generally clothed with a coarse grass, bushes, and single standing trees. In summer these trees and bushes shed their leaves, and as the grass in most places is withered at the same time, the country has a dismal aspect. But the valleys along the watercourse have a much more fertile soil, and here the high trees and thick foliage which cover them are replaced by small trees and bushes, which are adapted to culture and for raising nearly all the products of the coast. The plains yield only pasture for cattle.

This plain is drained by four rivers of considerable extent, the S. Francisco, the Tocantins, the Xingú, and the Tapajós. The upper branches of the S. Francisco rise on the N. declivity of the Serra dos Vertentes about 3000 ft. above the sea, and between 21° and 20° S. lat. They are principally two: the Paraopeba, and that more properly called the S. Francisco, which unite after a course of 100 m. franco. The mean level of the S. Francisco is 1897 ft. above the sea. The riv. then flows in a nearly due N. direction to its junction with the Rio das Velhas (8° of 17° S. lat.); but before reaching this point, it forms the cataracts of Pirapora. At the junction with the S. Francisco, the current is so rapid that the Rio das Velhas rises in the neighbourhood of Villa Rica, on the N. declivities of the Serra Mantigueira, and runs upwards of 250 m. From this point the S. Francisco continues to flow N. with a slight declension to the E., and is known by the name of the Alto. Several falls occur on the rapid Atalaia as it descends towards the mixture of the rivers. At its junction with the Rio das Velhas, it is still 1000 ft. above the sea, so that in a space measuring in a straight line nearly 500 m., it has only a fall of about 700 ft. It has here numerous windings, and is navigable down to Vargem Redonda, near the mouth. Near the Serra de Minas, the river falls. In all this course it is not joined by any considerable tributary, and on its banks there extend for about 250 m. salt steppes, in which the mineral appears in the form of an efflorescence, and is collected by the inhabitants. Vargem Redonda is about 30 m. from the river following the course of the riv. Not far from this place the river is narrowed by high rocky cliffs on both sides, runs with great rapidity, and forms several falls, of which the Cacheoeira de Alfonso, the most considerable, is said to be 50 ft. in height, and 40 ft. in breadth. The river descends in a flat space of nearly 70 m., and terminates at the Aldeia do Canindé, whence a road leads to Vargem Redonda for the transport of merchandise into the interior of Brazil. From the Aldeia do Canindé to its mouth, the riv. runs still about 30 m. in length, to its mouth. At its mouth the current is rapid. Though a deep riv. in the interior of the continent, the Rio de S. Francisco enters the sea by two comparatively shallow mouths of unequal size, of which the N. and the larger is nearly 2 m. wide, but with so little depth that only vessels of 50 tons can enter it at high water, and must wait for the full tides to go out. The tide ascends it about 50 m., and it rises at Villa de Pinedo, where the riv. is about 1 m. wide, 3 ft. at full and change. The inundations are considerable, especially above the falls. The river descends 1000 ft. from the Serra de Minas to Feb. Being skirted in most places by low and level tracts, its waters cover the country along its banks to the distance of 15 or 20 m., and in some places it penetrates still further by means of some channels, by which the adjacent hills are divided from one another. The current during this period is so rapid in the middle of the riv., that the barges make nearly 100 m. in 24 hours down the stream. These inundations cultivate the country, and are particularly favourable to the cultivation of the sugar-cane. The pop. of its basin is increasing rapidly. The average altitude of the Rio de S. Francisco may be above 1300 m., and it may be compared with the Volga.

The Rio Tocantins is divided from the Rio de S. Francisco, not by a chain of high mountains, but by a table-land, which towards the upper branches of the riv. on each side, and towards its confluence with the Araguaia, is overtopped by groups of hills of considerable height. The upper branches
of the Tocantins rise in the Montes dos Pyrinos and in the Serra Doirada, both portions of the Serra dos Verdetes. In the Serra Doirada rises the Urubú, which is considered as the true source of the riv., and after a course of 70 m., joins the Rio Almas, which is not inferior to it, and descends to the Pietro Maranhão, where it receives the name of Rio Almas to its confluence with the Maranhão, which joins it 90 m. farther down. The Maranhão rises in lake Formosa, which is 15 m. in length, and two in width, and flows to the W. and then to the N. Hence the united riv. is called Maranhão, to its junction with the Paranatinga, about 140 m. lower down (12° 20'). The Para- natinga is formed by the junction of two considerable riv., the Paranam and the Fama, the former of which flows nearly 300 m. Hence the riv. is called Tocantins, and be- comes hereabout 200 m. wide, and 2 m. deep, and 374 fathoms wide. The number of its affluent s lowers down is great, but none of them is very considerable, except the Rio Araguay, which joins it at about 6° S. lat. Before the Tocantins arrives at this point, its navigation is inter- rupted by some cataracts, between 3rd and 6th, among which the most considerable are the Cachoeira de S. Bartolomé or das tres Barras, and the Cachoeira de S. Antonio. After its junction with the Rio Araguay the Tocantins flows between rocks and cliffs, forming many rapid s and small cataracts, and this part of its course is called the channel of Tanirí. Issuing from this channel, it has near Itaboca (3° 30') more considerable cataracts, which rise above one another like terraces, and then too riv. enters the low country skirting the Amazonas. Its whole course is in a N. direc- tion, and 15° S. lat. It is joined by the large riv. of the Rio das Amazonas, and takes the name of Rio da Pará. At the point of junction is an island, about 15 m. long, and low and flat, called Uararayá, which divides the mouth of the Tocantins into two arms; of which the E. is called the Isal, and the W. the Marajoa. The width and the width of the riv. is here upwards of 15 m. The Rio da Pará, which divides the island of Marajoa or Joanes from the continent, widens in its progress to the N. still more, and may be above 60 m. where it falls into the sea (about 6° 29' S. lat.). The whole course of the Tocantins is at least 1500 miles.

The Araguay, the largest tributary of the Tocantins, rises on the N. declivity of the Serra Seixada, about 18° S. lat., where it is called Bonito, which name is changed into that of Rio Grande, after it has united with the Rio Bar- reiros and Rio Caiapo. Its waters are lower down in- creased by those of the Rio Claro, Rio Vermelho, Rio Tio- zonas, and Rio Crixa. All these riv. flowing from the S.E. join the Araguay on the right, and none of the three last can ever flow out of the country. In the rainy season the Araguay and its tributaries, the trade of Brazil area, which is the capital of Goyaz to Pará. About 30 m. from the mouth of the Crixa, the river divides itself in 12° 30' into two branches nearly equal, which reunite in 9° 36', enclosing the is1. of S. Anna, and are divided by a small riv. that crosses 200 m. in length, and of considerable width. The W. arm preserves the name of Araguay, and the E. takes that of Furo; barges generally go through the latter; but both contain small falls and rapids. The branch called Araguay receives, about the S. point of the island of S. Anna, the Rio dos Mortes, which runs nearly 300 m. At about 5° the Araguay joins the Tocantins after a course of above 1000 miles.

The Rio Araguay may be considered as the boundary of the interior of Brazil, the countries drained by the Xingú, and Tapajos being almost unknown. Though the rivers have been ascended the greatest part of their course, no European families have settled in this country, and it has not been traversed by land.

The Rio Xingú probably rises in the Serra dos Verdetes, about 12° 50' S. lat., but its sources as well as its upper course have not been visited. It does not appear that any of its tributaries are considerable. Between 6° and 9° lat. its bed is narrowed and traversed by a chain of rocks, and thus the course of the riv. becomes the brach of the Maranhão. These rocks make the riv. form a large bend to the S. and E., though in general the direction of its course is to the N., with numerous windings. The remainder of its course lies through the low plain on the banks of the Rio Amazonas, which it joins at Porto de Moz, where it is about 4 m. wide.

The Rio Tapajos has lately risen to greater importance, since it has been ascertained that it may be navigated with less danger and difficulty than the Rio Madeira. Since 1812, it has been the road of communication between the banks of the Guaporé, the Paraguay and the St. Laurence. The Rio Tapajos is a very considerable riv., forming the principal affluents of the rio, the Iuruena and the rio dos Arinos. The Iuruena rises near the point where the Serra dos Paricaris divides into two branches, one of which runs N., and the other, the Serra Agraephey, S., near 14° S. lat. It runs for upwards of 200 m., due N., and then inclines to the E. to meet the rio dos Arinos. The number of its affluents is very great, and at the confluence the Iuruena is the larger riv., but has not yet been navigated. The rio dos Arinos rises farther to the E., near the sources of the Paraguay, and runs first N., then E., and then S., where it is the only branch of the riv. which is at present navigated. After this junction the rio dos Arinos flows N.W., nearly to its confluence with the Iuruena, about 90° S. lat. Hence the united riv. is called Tapajos, and flows N.E. forming two cataracts, the Cachoeira de S. João de Barra and de S. Carlos. At the latter the course of the riv. is changed, and flows hence to the N.N.E. The largest of its cataracts, called Salto Grande, occurs at about 7° 30', and is said to be 30 ft. perpendicular height. Between 5° and 6° is another fall, called Cachoeira de Maranhão, which likewise inter- rupts the navigation. The remainder of its course is through the low country along the Rio Amazonas. This riv. is joined by numerous tributaries, especially from the right. It falls into the Amazonas near Santarem, where it is about 4 m. wide.

On the banks of the Iuruena, and to the N. branch of the Serra Paricaris, extends a sandy desert, called Campos dos Paricaris. The surface is formed by long-backed ridges of sandy hills, parallel to one another, and divided by longi- tudinal valleys. In the latter the beasts of burden can hardly proceed; and it is nearly desti- tute of vegetation, except where springs issue from the ground. The extent of this desert, which may be consid- ered as occupying the centre of South America, has not been accurately described.

The climate of the Campos Paricaris has not yet been described. That of the table-land which extends to the E. of it differs in many respects from the climate of the coast. The rain begins in October, with heavy thunder-storms, and lasts till April, but it is less in quantity where the country extends in nearly level plains. The medium heat is stated by Freyreiss to be only 65° Fahrenheit, but it often rises to 100° at noon. The difference between the tempera- ture of the day and night frequently amounts to 30°. In the summer months the rain is almost incessant, but times in the month of June or July slight frost occurs, espe- cially towards the Serra dos Verdetes, in the S. districts, which destroy the crops of the bananas, sugar, coffee, and even cotton. Thunder-storms prevail only in the plain, and are comparatively rare in the mountains. The winds are irregular at all seasons, and frequently bring dense fogs.

The table-land of Brazil is separated from the Andes of Bolivia by a large and extensive plain, traversed by the means which by their junction form the Rio Madeira. This plain may perhaps rise to the height of 1200 or 1500 ft.; the latter being the height which, according to the esti- mate of Martius, the country attains which forms the water- shed between the Pecocay and the Uabá. A greater part of this plain is covered by savannas, extending along the W. declivity of the N. branch of the Serra Paricaris on both banks of the Rio Guaporé. A few scattered hills rise on the plain to a moderate elevation, and are divided from one another by extensive level tracts, mostly covered with high forest-trees, and hemmed in by a few barren districts without trees and with little vegetation.

The Rio Guaporé, called also Itenez, rises (14° 30' S. lat.) in the Serra dos Paricaris, about 100 m. N.E. of Villa Bella, the capital of Matto Grosso, and at first runs in a northeast direction to the N. of the Jaru, a branch of the Xingú. It then turns W., and receives the waters of the Rio Alegre, a small but navigable tributary. In 1773 an unsuccessful attempt was made to unite this river by a canal with the Rio Agraephey, which falls into the Jaru. At the junction it joins the riv. of the Guaporé, and then to the W., where it is joined on the right by the large Rio Paraguay, and the still larger Uabá. At the confluence with the latter it turns N., and
The Madeira is formed by the junction of the Rio Beni with the Mamoré (in 10° 22' S. lat.), which takes place about 100 m. below the confluence of the latter with the Guaporé (in 11° 45' S. lat.). This river runs in a N.E. direction, descending by the principal valleys of the llanos in 3° 24' S. lat., about 70 m. below Villa de Borba, after a course of upwards of 600 miles. As the river, after the junction of the Mamoré and Beni, is 900 fathoms wide, and in its course in general preserves this width, with a considerable depth of water, navigation were its course not interrupted by numerous cataracts. Below the union of the two principal rivers, thirteen cataracts occur; and above it, in the Mamoré, five. They begin in the great cataract known as El Chaco, and are at 8° 49' 8' S. lat., with the Sitapuy or San Tonio. The highest of these cataracts is in 8° 52' S. lat., where the river descends 30 feet. It is however supposed that all the falls taken together amount only to 150 ft. of height. The Madeira was frequently navigated up to 1775, but at present other lines of communication are preferred.

The N. part of Brazil comprehends the greater portion of the river of the Rio das Amazonas, one of the most extensive of the globe. It lies along the east side of the Amazonas, near 5° 56' W. long., to the mouth of the Ucayale, near 7° 22' W. long., and consequently extends in this direction about 1500 miles. The width of this plain varies, being much narrower towards the mouth of the river, and the great discharge of water, in the Xingó (6° 26' S. lat.) and the Serras de Tumucuhraque and do Acaray, which chain divides the sources of the Essequibo and Mazarony from the riv. falling into the Amazonas, the plain hardly extends S. and N. more than 3° S., or about 350 miles. Under the meridian of 6° it begins S. at the cataracts of the Rio Madeira (6° 48'), and extends N. to the S. branches of the Serra Parima (3° N. lat.) about 800 miles. It is probable that its width enlarges considerably still farther to the W., but here the knowledge of the extension of the Amazonas, as on other rivers in countries not yet explored. This plain is divided by the Rio Amazonas into two parts, declining insensibly towards the bed of the riv., but not everywhere in the same direction. On the E., as far as the mouth of the Madeira, its surface declines N. and S., but to the W. of the Madeira the declivity is directed S.E. and N.E. Hence the riv., joining the Rio Amazonas towards its mouth, form nearly right angles with its course, but the Madeira and the riv., which unite with it farther to the W. form acute angles, and some of them only of 15° or 20°, and the declivity a considerable part of their course nearly parallel to it. But this declivity is so imperceptible that the eye cannot discover it, and some of the rivs. seem to have no current at all in the lower dry season, as is observed of the lower course of the Rio Madeira, as well as the Madeira itself, the latter, rare, but the surface, does not present one unvarying level like the plains on the Orinoco: it consists rather of a continual succession of extremely slight undulations, and to this peculiarity of its surface, joined to its tropical climate, it seems principally to owe the incomparable luxuriance of its vegetation.

The softness of the soil, which consists, as far as it is known, nearly everywhere of earthy matter, possessing only a small degree of cohesion, yields readily to the impetuous rush of the water, and, in consequence, the almost countless larger and smaller islands which continually divide the riv. into numerous channels. In other countries travellers generally think it necessary to observe the islands formed by rivs., but in this plain, on the contrary, it appears an extraordinary occurrence if at any place the whole volume of the riv. runs in one channel. These islands occupy a considerable portion of the plain: they are inundated in the wet season, but when the riv. is low, they rise 20 and 30 ft. above the surface. They have a sandy bottom, but are very swampy.

The tracts which skirt the banks of the riv. are generally low, and overflowed when the riv. rises. In many places the inundations are extended much farther inland by the channels which, in the dry season, bring down the water from the numerous lakes. But during the inundation these channels carry the water from the riv. to the lakes, and the low country in their vicinity is covered with water. All the tracts thus inundated are overgrown by an uninterrupted forest of trees of different sorts. The bushes and underwood between them, and all these plants are tied together by numerous creepers, so that they form a vegetable wall, through which it is impossible to penetrate. The water-courses are the only habitable places in the land which is not subject to inundations is likewise covered with interminable forests, but the trees are of more equal size, and without underwood, though here also the creepers are numerous. Occasionally some tracts of moderate extent occur, which are without trees, and covered with rich grass, intermingled with a few low bushes.

Nothing however characterizes this plain more strikingly than the incredible abundance of water. Brooks and ponds are of rare occurrence, for they enlarge immediately into rivs. and lakes, and the banks of the channels of the larger rivs. (the only part of the country which has yet been visited) an interminable watery maze. Martins is at a loss how to explain this matter. He thinks that the inundation cannot account for it, and supposes that the soil of this plain contains an extraordinary number of sources and springs, and that the water issuing from them is continually increased by the moisture of the air, which is more especially abundant in tropical countries whenever they are not inundated, by reason of the great quantity of water contained in the large proportion of the soil, and the comparatively small inequalities of the surface, have made some phenomena common here which are rare in other countries. Such are the natural canals by which two rivs. are united. Between the Madeira and the Rio Negro, there is no cataract, no communication between the two, at least 120 m. distant from one another.

The other river which drains this plain, we have already noticed the Tocantins, Xingó, Tapajós, and Madeira. To the W. of the last, and nearly parallel to it, flows some considerable riv. of which we have no other information, the Itanorá, the Iutahy, and the Hyaraby or Yavary. These rivs. which run from 600 to 800 m., have not been explored, and the country through which they flow is nowhere infested by the Indians which inhabit those countries; but according to the information of the Indians which do not inhabit the region mentioned, there are no other rivs. than those above mentioned, which drain the plain of the N. of the Rio das Amazonas belong partly to the republic of Ecuador, as the Pastaza, the Tigre, the Napo, and Putumayo or Ica, only the lower part of the course is included in Ecuador, as the part before mentioned is in Brazil, going generally by the name of the Rio Apurímac. The river Yuruparí is the most important tributary of the Rio Negro. The remote branches of the Yuruparí originate in the S. of the republic of New Granada, in the mountains of Popayan, where they descend into the plain. The greatest part of its course is within the boundary of the republic of Ecuador, in which it forms, in 79° 40' W. long., a cataract called Cachoeira de Amora Comra, about 60 ft. high. It is not yet determined if the country between this fall and that of Cupati, which occurs 3° farther E., belongs to Brazil or to the rep. of Ecuador. The river Yuruparí, at this stage, is navigable for its largest tributary, the Apurímac. The fall of Cupati is however the only rapid. From this fall downwards the Yuruparí, flowing nearly parallel to the Rio Amazonas, is divided from it by a low, wooded country, of which the greatest part is annually inundated for some months. About 100 m. from the mouth of the Yuruparí, on the Amazonas, is the port of Yuruparí, which is 80 m. above the mouth of the Yuruparí. In this canal the water flows from December to May N.E. from the Rio Amazonas to the Yuruparí, and from June to November S.W. from the Yuruparí to the Rio Amazonas. The large is. formed by this can. and the riv. is traversed by other canals, which are subject to a similar change of current. The Rio Negro originates in a swampy country about 2° 30' N. lat. and 70° 30' W. long. and runs first N.E. and afterwards S.E. about 200 m., when
it is joined by the can. of Cassiquiare, which comes with a rather rapid course from the Orinoco. Hence it runs with numerous windings nearly due S. till it is joined from the W. by the Rio Uaupê or Uaupes, which should be considered as the principal branch. This riv., whose sources are very imperfectly known, seems not to originate in the principal range of mountains, but is derived from a considerable distance E. of them. It flows first for a great distance S.E., and then turns E.: not far from the place where the Uaupe begins to turn to the E., it forms a considerable cataract, the Cachoeira de Ipanoré. The Uaupe may have run 500 m. which is intersected by the Rio Negro near the equator, between 67° and 69° W. long. From this junction the Rio Negro flows E. with a slight declination to the S., which increases as it proceeds till its course is S.E. In this part of its course the Rio Negro has rather the appearance of a branch of the Orinoco, 30 m. wide, with only a few rapidly flowing and tortuous channels of a different riv. It sometimes narrows to 12, 15, or even 20 m. in width, and sometimes narrows to 1 or 1½ m.: its current is generally very slow and not disturbed by rapids. Above 200 m. from its mouth it is joined by the Rio Branco, whose principal branch, called Uaricoura, originates in the Serra Parima, at no great distance from some of the branches of the Orinoco, and flows E. till it joins another considerable branch, the Tocuatu, which rises near the sources of the Rio Negro. The easternmost branch of the Orinoco, the S.E. parallel to the Rupuniri. The Tocuatu afterwards turns S. by a bold bend and joins the Uaricoura. Both branches have probably a course of more than 200 m. before their junction. The united riv., called Rio Branco, 300 m. above the mouth of the Tocuatu, has only a few rapids: cataracts however occur in the Tocuatu. The upper course of the Rio Branco is without the boundary line of the plain of the Rio Amazonas. About 50 m. below the mouth of the Rio Branco, a can. branches off from it to the left called Caraipa, which lies in S.W. and S. direction, and passing through the Lake of Cuyaba, sends its waters to the Rio Amazonas by the can. Cuyaba, about 100 m. above the principal mouth of the Rio Negro. The whole course of this river may be 1200 m., and the Uaupe is taken for its principal branch, probably 100 m. more.

No large riv. traverses the N. plain E. of the Rio Negro. The Orito orina or the Trombetas and Gurupustuba are the most numerous. The great plain of the Rio Amazonas, which even on its extreme borders hardly anywhere exceeds the elevation of 600 or 700 ft. above the sea, and extends on both sides of the equator, differs in climate considerably from other tropical countries. The dry and rainy seasons are here not so distinctly marked as in other parts of South America. It is even at times in the night no cloud covers the dark blue sky, and this serenity continues to the morning hours. But between 9 and 10 o'clock clouds begin to appear on the horizon, and rapidly extend towards the higher parts of the country until after noon, when the hot sun begins to toil under the scorching light. The climate is therefore in winter very dry, and in summer very hot. Occasionally there is a very light rain, and this rain is most abundant from August to October. They increase during the month of November and are accompanied with more violent thunder-storms; the rains generally continue in equal abundance to the end of March. Frequently the dark blue sky is broken by a succession of bright flashes, which terminates in January and February, which is called Veranico (summer), and then they continue more abundant from April to May. The wind is by far the most prevalent. The trees never without leaves; for they are not subject to the old rules of growth already forming. Most of the trees and plants, especially those which are peculiar to a tropical climate, blossom between November and March, and bear fruit between June and September.

All the rivers, traversing the plain immodestly the adjacent low lands, but the inundation does not take place in all of them at the same time. Some of the S. affluents of the Rio Amazonas originate near the tropic, and others at no great distance from it; but the northern rivers, exterior country, N. to the equa- tor. The periodical rains are different in these countries, and the riv. rise and fall at different seasons. The riv. descending from the table-land, the Xingu and Tapajos, begin to rise in Nov., attain their greatest height in Jan., and find their lowest level from Aug. to Oct. The Madeira, whose changes coincide with those of the principal riv., and which therefore has in this respect the greatest claim to be considered its principal branch, begins to rise in Dec., and attains its greatest height, May and June, and falls to its lowest level from Aug. to Oct. The N. riv. begin to rise in Feb. or March, and are fullest from July to Sept., when the water in the Rio Amazonas has nearly attained its lowest line. This explains why the canal of Avatãparani, between the Yupurã and Amazonas, flows from June to Aug. S.W. into the latter, and from Dec. to June into the Yupurã. The height which the water attains above the lowest level varies in different riv.: in the Xingu and Tapajos it is 35 ft.; in the Madeira, as far up as the cataracts, 38 ft.; in the Rio Branco, 40 ft.; in the rivers of the Uruará region, and in the Rio Amazonas, in the plain, 40 ft. and upwards.

On the N. of the Rio das Amazonas, the plain extends to Macapá, opposite the island of Caviana, which lies in the principal embouchure of the riv.; on the S. it includes the lower course of the Rio Tapajos, and extends to the series of hills which run at a distance of about 50 m. from its banks on the E. parallel to its course. To the E. of these hills lies another plain, which also, though less extensive, measures from N. to S. upwards of 600 m., and from W. to E. upwards of 500 m. The hills are separated from the Parnahybas. This plain, which may be called the plain of Parnahybas, differs nearly in every respect from that of the Amazonas. Its surface is much more uneven, rising frequently to hills of some hundred feet elevation, which support extensive marshes. This plain is separated from another by large plains destitute of trees, overgrown with greyish high grass and a few bushes. The lower districts of this part are favourable to the growth of cotton, the soil being rather dry and sandy.

The Pará River begins near the S. angle of the plain, near 16° S. lat., and traverses it in a diagonal line from S.W. to N.E. and N. Having no falls and only a few rapids, it is navigated by vessels of from 13 to 40 tons to its junction with the Rio das Balsas, up to which place the European settlements on its banks are numerous. It empties itself into the sea by five mouths, the most remote of which are 30 m. from one another, measured along the shore. But as these mouths are not more than two to four fathoms deep, only vessels of moderate size can come up to the town of S. Rio de Janeiro. The discharge of the river, from nearly 600 m.; and, with the exception of the Francisco, it is the largest riv. that enters the sea between the Rio de la Plata and the Amazonas.

The climate of the plain is hot; the thermometer rises in summer as high as 106° and sometimes to 110°. The rains begin in Oct., and increase gradually to Feb., when they are most abundant; they terminate in April; but even in May it generally rains between three and four o'clock in the afternoon. The months of July, Aug. and Sept. are usually very rainy. The prevalent wind is from the S., especially during the dry season.

The E. boundary of this plain is formed by the Serra Ibipabara or Hibiappaba, from which extends E. the mountainous country that forms the projection of Brazil, which terminates with the capes of St. Vincent in South America, and St. Thomas of the island of Tamoin. It resembles, in some respects, the table-land of Brazil; but the mountain plains are of less extent, and the valleys occupy proportionally a much greater part of the surface. The mountains, of which the tops of the mountains and their declivities are closed, or covered with grass and bushes. The rain of Brazil, it rains less; the rainy season begins only in Jan. and terminates in April. In this season vegetation is vigorous and rapid, but from Aug. to Dec. the country resembles a desert. Sometimes, and as it appears in decennial periods, there is no rain at all, and then both men and animals die of hunger and thirst.

No. 317.

[The Penny Cyclopædia.] Vol. V.—A.
Cape Augustinópolis (Augustinó), in 8° 20' 41" S. lat. and 34° 36' W. long., is one of the most E. points of Brazil. About 360 m. from the cape, the great equatorial current, which towards the Atlantic extends northwards, divides into two branches, of which the N. and by far the larger part runs along the N. coast of Brazil to the mouth of the Rio das Amazumas, and hence along Guiana to the West Indies. This current, combined with the trade-winds, which along these coasts are almost parallel to the surface of the water, from the N. parts of Brazil along this shore to the provinces S. of Cape Augustinópolis so tedious, that it is more easy for the inh. of this part to communicate with Europe and North America than with the S. provinces of the empire. The S. branch of the equatorial currents called the Brazilian current is at first of considerable breadth, but it grows wide in 16° and 17° S. lat., where it is 250 m. from the coast. At Cape Frio it is only 200 m. distant, and runs 30 m. per day. Where the coast trends to the S.W., the current is farther off, but it approaches again within the same distance near the Morro de S. Marta, and so continues to Cape de S. Maria.

Between the coast and this current occurs a regular change in the wind and currents; and their direction depends on the position of the sun. When it is S. of the equator the winds blow from between N. and E. and the current S. or S.W.: when the sun is on the N. the line the winds blow from between E. and S.E. and the current flows to the N. These regular and constant changes are very favourable to the intercourse of the maritime provinces of Brazil and Cape Augustinópolis.

We must here observe that the S.E. trade-wind of the South Atlantic ceases at a great distance from the coast of Brazil, and that other winds, especially from the N.E., are sometimes found to extend to the middle of the ocean. This circumstance is benefit to the S. part of South America continent, which has the effect of changing the trade-wind into a monsoon.

The cultivated lands in Brazil bear a very small proportion to the whole surface. According to the most favourable statements the former are 30,000 sq. m., or less than 1/5th of the surface. But this is evidently a very exaggerated estimate, and it is more probable that they do not amount to one-third of that area. With the exception of the immediate vicinity of the larger towns of Rio, Bahia, and Porto Novo, the coffee plant occurs from one another, even in the neighbourhood of the sea, and still more so farther inland. They are nearer one another in the E. district of the tabe land of the Paramá, about S. Paolo in the mining district near Villa Rica, and along the river Piracicaba. In the prov. of Maranhão, Agriculture is carried on in a very rude manner. The forest-trees are cut down and burnt on the ground; the soil then gives rich crops for several years without manure. When it is exhausted it is abandoned, and another piece of ground is similarly treated.

The aborigines of Brazil were not entirely unacquainted with agriculture, but it was limited to a few articles. They planted maize, bananas, *apia* (*Manihot aipi*, Pohl), manioc, and caspicum. Since the arrival of the Europeans and Africans the cultivated plants have been increased more than tenfold in number, but still the cultivation of those which were grown by the aborigines is the most extended. The manioc, of which different species are cultivated (*faturapa mantihot*, Linn.), is grown in every prov. except that of Río Grande do Sul. *Maize* (*Zeus Mat*, Linn.) is cultivated all over the country. In the Amazonic district, the milho cabedo, a species with smaller grains, is commonly cultivated; it yields twenty fold. The Milho Serra, with larger whish grains, is grown in the valleys of the table-land, especially in Minas Geraes, and yields 110 fold. Two crops are annually got, one in September and the other in May; the first is the most abundant.

*Ríe* (*Oryza sativa*, Linn.) is extensively cultivated on the plains as well as on the mountains, but especially in the prov. Maranhão and Para. Two species are used, a red and a white one. In the latter the grain is 2 m. in one country it ripens in 4 months and gives abundant crops from 50 to 60 fold, in some places even from 200 to 300 fold. On the hills it ripens in 6 months, produces less abundant crops, and is not so good. No artificial irrigation is used. *Ríe* is not very well suited for the cultivation in a wild state, as in the Lagos de Xarayes, and Martius found it also on the banks of the San or Furo of Iriáz, which divides the long island of Topinambres, or more properly Tapinambarana, in the Amazonas, from the S. bank. The cultivation of wheat has been attempted in the ier. *Tapioca* (*Manihot esculenta*, Linn.) is cultivated in the table-land of the Paramá and the plains of Río Grande do Sul, whence considerable quantities are brought to Rio Janeiro.

The banana (*musa*) is cultivated in the low plains and valleys along the coast and in some parts of the Amazonas. The best *banana* is Río Janeiro, the S. districts of Minas Geraes, and Para. A certain quantity is annually imported from England: but sweet potatoes succeed wherever there is a good sandy soil. The *caru*, a root similar to the sweet potato, and superior in flavour, is less productive. The *hibiscus* (*Pharax spic-, especially in Río Janeiro, the S. districts of Minas Geraes, and Para. None of the trees are cultivated in Europe for oil are found in Brazil. The inhabitants cultivate the sesamum (*Sesamum orientale*), which was brought from the E. I., and different kinds of the castor-oil plant. Lamp-oil is got from the fruit of a forest-tree called *andra* (*Carapa guajania*, Aulx., *Yxilocar-pus*, Schreb.), which is common in some districts, especially in the plain of the Amazonas. A species of palm (*Eno- carpus distichus*, Mart.) which gives an excellent oil for the kitchen, grows on the N. coast. The *oca* and *oca* (*Erithopy- rum excelsum*, Jacq.) which is used by many of the aborigines of South America pretly much as the betel in India, is cultivated on the banks of the Yupurá, as in Peru. The *maté* (*Cassine gononza*, Mart.), which produces the tea of Paraguay, is a shrub which is cultivated in the prov. of Rio Negro, and which grows wild in Patagonia. It forms a considerable article of export from some countries of South America, especially Peru.

Coffee, which was introduced into Brazil about 50 years ago, is now grown in most of the maritime prov., more especially in Río Janeiro, the S. districts of Minas Geraes, and in Bahia. That of Río Janeiro is the best, and since more attention has been paid to its culture, it is considered equal to that of St. Domingo. The sugar-cane is most extensively grown in Bahia and along the banks of the Río S. Francesco. The smaller variety, called canna da terra or canna cresa, is the most common. The cultivation of this article does not increase so rapidly as might be expected, probably for want of sufficient capital. In other districts of Brazil the cultivation of the sugar-cane is less extended than in the maritime prov.s, a certain quantity is exported. Cotton has been mixed with other article of export. It may be grown as far as 31° S. lat., but is only cultivated to any great extent from 15° S. to the equator. The cotton of Pernambuco, in which that of Rio Janeiro and Río Grande do Norte, and Seará is included, is hardly inferior to that of Georgia. The *Bourbon* coffee, a species which is raised in Pauly and Maranhão is also in high repute: that of Bahia and Pará is of less value. In Pernambuco the cotton is gathered in July and August, in Maranhão in October, November, and December. On the banks of the Amazonas there are two trees, the manguba and the samaha (*Erodendron samuna*, Mart.) which produce a kind of cotton that is used to make felts and mat- tresses, but hitherto, we believe, the attempts to spin it have failed. The cultivation of tobacco, which formerly was very extensive in Brazil, was destroyed by the war with Spain. Tobacco is still cultivated in Brazil, and the colonies in Brazil are in the hands of the tobacco growers. Tobacco is now cultivated as a crop in Brazil, and the colonies in Brazil are in the hands of the tobacco growers.
The immense forests which cover the plain of the Rio das Amazônas supply various articles of export. Cacao is gathered very extensively, as well as cloves, cinnamon, vanilla, saraca-palma, caoutchouc, Brazil-nuts, and different balsams, as copaiba, and copal. The forests on the coast provide a large number of gums and resins, like the gums of India, used in making of furniture and dyeing. The fruits of Europe, which succeed best in Brazil, are figs, oranges, pomegranates, quinces, and a small sort of lemon. It is commonly asserted that grapes do not ripen; but Martius found that the vines bore abundantly in the neighbourhood of Bahia, as well as in the plain of the Rio das Amazônas; and that they produced ripe grapes twice a year, in June and in December.

Pine-apples are sometimes found wild in the forests near Pará, and the palms are abundant in the district N. of 30°, near Pará attain an extraordinary size, with an exquisite flavour.

In the N. provinces palms abound, and perhaps every one of the numerous species may be applied to some useful purpose. The most useful is the coco-palm (cocos nucifera L.), which is common along the coast between 10° and 20° S. lat. and principally valuable on account of the cãoir or outer part of the fruit, of which ropes of great strength are made. The coco-de-mer, or oil-palm (Elaeis guineensis L.), which is chiefly cultivated in the Ashanti. The nut is very hard, like the coco-tree on the coast, but also to a considerable distance from the shore, and yields an oil which is used for lamps and culinary purposes. The leaves of the piapapa-palm (Attalea funifera Mart.), which grows wild between 10° and 20° s. lat., the leaves are so long that it excels in their excellence, which does not succeed in these parts of Brazil. Cables made of these leaves are much preferred to those made of cãoir, being three times as strong.

Of the native vegetation of so extensive a country as Brazil, one can give only some general ideas, as it cannot be surveyed into numerous details for which we have not space. Those who are desirous of making themselves acquainted with this subject will find the most valuable sources of information to be the following:- Auguste de St. Hilaire’s Voyage dans l'intérieur du Brésil; the travaux of Martius and Spix; and of Prince Maximilian of Wied-Neuwied: the Pflanzen and Thiere des tropischen America, in Naturgeschilde von Dr. C. F. Ph. von Martius and the Aperçu d’un Voyage dans l'intérieur du Brésil. La province cuyaptine et les Mémories du Museum, vol. ix. Even these, full of information as they are, convey no precise intelligence concerning the S. and W. frontier of the vast state, and we have still to wait for details with which the unexplored portions of the Provinces of the frontier provinces, which future travellers may supply us, before any good connected account of the Brazilian Flora can be prepared beyond the provinces with which Europeans have most frequent communication.

We may call a proportion of Brazil is cultivated, and by far the greatest part consists of extensive plains, very thinly wooded and frequently entirely without trees, the pastures are extensive, and one of the principal sources of wealth is in the domestic animals. The best pastures are to the S. of 20° S. lat., in Rio de Sul, St. Paolo, and the S. districts of Minas Geraes. The herds of horned cattle are here immense, and their produce, consisting, besides live stock, of hides, jerked beef, tallow, horns, and horn-tips, is exported in great quantities. As soon as the animal is cast, a large number of them are salted, slightly salted, and dried in the sun. The flesh is cut into thin slices, salted, and dried in the air. Thus prepared it is called Carne seca do Serêio, proca or carne charqueada, and is carried from the S. prov. to the N., where it is consumed by the poorer classes, and especially by the negroes. Butter is made in St. Paolo, and cheese in Minas Geraes, but neither is good. By far the greatest part of the cattle live nearly in a wild state, and are not milked. Cattle hair is exported from Rio Grande do Sul.

There are numerous in the S. provinces, but less so in St. Paolo than in Rio de Sul. The number annually exported to the N. is vaguely estimated at 40,000 or 50,000 head. They are of a middling size, from 12 to 14 hands high, but strong, lively, and swift. Those reared in Espirito Santo and called Campos horses, are beautiful animals and last longer. Even near the equator, in the prov. of Pará, good horses are reared, and during the disaster in Caracas a considerable number was exported to Barbadoes and other British settlements. Mules are only reared in the S. prov., but in great numbers. In 1814 17,504 head were exported to the N. prov. The sheep is in little repute, the meat being ill flavoured, and the wool very coarse. A different species of sheep is reared in the Pampas, and raises a wool for their milk. Hogs are kept in great numbers. Monkeys are among the wild animals used for food. The Indians skin and roast them on a gridiron over a slow fire, and in this state preserve them for a long time. A great number of these animals live in the forests along the Amazonas, where Spix observed 25 different species; some of very small dimensions. Many monkeys live in a domestic state with the Indians, but do not propagate their species. The meat of the cebo gracilis of Spix is preferred to all others by the Indians.

The other wild animals used for food are the following. the anta or tapi, three species of porcupine, three species of nasie, five species of deer, the Brasilian hare (lepus brasiliensis, L.), five species of armadillo, seven species of paca and agouti, and the wild bear; and of bats two kinds, the vampires and the quindiri, which stick to domestic animals in the night-time, and suck their blood. The largest bird is the American ostrich or emu (Struthio rhoea), which is found in numerous flocks on the table-land, with its young, and even with its eggs exposed to the eyes of which different articles are made, as fans, &c. The other birds are more remarkable for the beauty of their plumage than their voice. The most beautiful are the toucans (Ramphastos dicolor), the tanagras (Lonagra americana), the scarlets, of which different colours, as also the Baleeane cranes, and the humming-birds. Many other birds are suitable for food, and especially the different kinds of pigeons, which are caught by steeping grain in the poisonous juice of the mandioca plant.

As soon as they have devoured them they are unable to fly away.

The numerous lakes at the S. extremity of Brazil in the prov. of Rio Grande do Sul are at certain seasons covered with water-fowl, especially geese and ducks; this is still more the case in the earlier part of the year. The Indians of the Amazonas, where the Indians kill great numbers of storks, cranes, ducks, &c. The Indians have succeeded in domesticate some of the wild birds; but it is observed that they do not propagate their species in the domestic state for any long time, and that occasionally they are lost.

Fish must be considered as one of the most important sources of wealth to Brazil. Whales, which in the S. hemisphere approach much nearer to the equator than in the N., and come as far as 15° S. lat. formerly yielded considerable profit to the seamen of the east coast of Brazil. Clarence_Beekman. The trade is now much depressed, in consequence, it is supposed, of the numerous fishing establishments of the English and North Americans on the Falkland Islands. Farther S. on the coast of Rio Grande do Sul the physiceus macrocephalus, Linm., is frequent and in great number; the same animaçõ is met with along the coast of Parana. The fish caught along the coast the garupa is the most important.

It attains the length of from 12 to 20 ft. and is very well tasted. It is most abundant along the shores of the prov. of Bahia, where great quantities are annually caught and exported. But the quantity of fish in the Amazonas and its large tributaries as far as the cataratas is truly astonishing, and in many places the inhabitants, Indians as well as European settlers, gain a considerable part of their subsistence by fishing, in which the Indians are employed in great numbers; but this occupation is not, however, confined, in consequence, it is supposed, of the numerous fishing establishments of the English and North Americans on the Falkland Islands. Farther S. on the coast of Rio Grande do Sul the physiceus macrocephalus, Linm., is frequent and in great number; the same animal is met with along the coast of Parana. The fish caught along the coast the garupa is the most important.

The fish caught along the coast the garupa is the most important.
sometimes 20 ft. long, and weighs from 70 to 80 cwt. One fish often yields 480 or 500 gallons of oil, and its flesh, when properly cooked, is very good. It has been made of it, and sent to Portugal as a delicacy. It is a very peaceful animal, and rapidly decreasing in numbers. Its greatest enemy is the alligator, of which there are two species in the rivers of Brazil, the crocoddus niger, Spix, in the Prain, and the Crocoddus niloticus, of the Rio Franceses. The former is generally from 15 to 24 ft. long. The Indians eat its eggs and flesh, though the latter has a strong smell of musk.

There are several species of turtles in the Rio Amazons, but that called Tartarugue Grande (Emysa Amazonica, Spix) is most common. Its flesh generally weighs from 9 to 10 lb. The farms in the neighbourhood of the river have places well fenced, in which they are kept and killed as they are wanted. On some sandy islands of the Rio Amazons, as well as in the Negro, the hens lay their eggs when the water is lowest: the eggs are gathered, broken, and by means of a slow fire reduced to a fat substance, called manteiga de Tartugue, which is extensively used all over Brazil. About 20,000 tons of this fat, each containing 60 lbs., are annually made, and several thousand persons are occupied in its preparation.

Snakes are common in Brazil, but the number which are poisonous, according to Freyreiss, is not very large. He names only six poisonous species, among which the klapper-snake is the most dangerous. The larger species, which are not poisonous, attain eighteen to twenty ft. in length.

The insects of Brazil are remarkable for the beauty of their colours and size, especially the butterflies. Some are very large and very elaborate. One family of beetles, each one species is fried and eaten as a delicacy. Persons, more especially Europeans, who have just arrived in Brazil, suffer much from mosquitos, sand-fly (Pulex penetrans) and some kinds of compass. The scorpion, which sometimes attains 10 inches, the tarantula, and some kinds of caterpillars, especially those of the family of bombyces, cause swellings and excessive pains.

The domesticated bee of Europe is not known in Brazil; but Martius has enumerated more than thirty species of wild bees, nearly all of which are without stings, and it is supposed that some of them could be domesticated. In the prov. of St. Paolo the nopal tree grows, and the inhabitants have begun to collect cochineal. Several attempts have been made to introduce the silk-worm, but hitherto without success. Martius also mentions that perhaps the god of the Philaeans, Atlas, L., which abounds on the N. coast, could be used as a substitute for silk.

The mineral wealth of Brazil is considerable, but limited to a few articles, of which the chief are gold and iron, diamonds and topazes, and salt. Gold is found on both sides of the Serra das Tapuieiras, and particularly from the lower part of the S. end of the Serra da Cavaquera, nearly to the N. branch of the Serra dos Paris, for a distance of about 200 m., but farther on the N. than on the S. side. It is found, more or less, in almost all the rivers which form the upper branches of the Franceses, Tocantins, Araguay, and Guaporé, but by far the greatest quantity has been collected in the affluents of the Franceses. On the arrival of the first Europeans small pieces of gold were found in some places in the sand, and considerable quantities were collected in a short time. The greatest quantity, however, has been obtained by washing the gravel from the beds of certain rivers, or the alluvial deposit on their banks. It is only in comparatively recent times that attempts have been made to work the mines in the mountains.

Before the beginning of the last century the quantity of gold obtained was considerable, but it increased rapidly. The greatest quantity was found between 1753 and 1763, and since that time it has always been on the decrease. According to the incomplete accounts which Escwege gave he calculated that the whole quantity of gold collected during the years 1719 and 1720 was 172,562 pounds, or 4,058,668 marcs, or about 33,922 marcs annually, including one-fifth which he thinks was smuggled out of the country. Between 1753 and 1763 it amounted annually to 34,560 marcs, but between 1801 and 1810 only to 8,218 marcs. It is therefore apparent that the statement which the writer has made of the country is not included; and it may amount to more than one fifth, at least for the latter period, when the means of communication had been greatly increased. The decrease of the produce was mainly owing to the better portion of the auriferous sand having been exhausted, and to the want of sufficient capital to work the veins in the mountains on a scale commensurate with the new discoveries made with success, and the productive mines at Congo Soco, near the Villa de Sabará, on the banks of the Rio das Velhas, a tributary of the Rio de St. Francisco, have been the reward of British enterprise. Iron is very abundant: in some places the beds extend for many miles, and since the sent time it has been worked on an extensive scale only in two or three places. No silver has been found, and only slight indications of copper, tin, and quicksilver. Platinum occurs on the banks of the Rio Abaeté, a tributary of the Franceses, and in some other places. Lead and cobalt are more common.

No country probably is richer in diamonds than Brazil, but hitherto they have only been found in the rivers. The most W. streams in which diamonds have been discovered are the Abaetés, the Aratuins, and of the large part of the Rio Parna, the Abaeté district, or the district of Tucupé, where by far the greatest quantity of diamonds has been found, is situated under 15° S. lat., and comprehends both sides of the Serra de Espinhaco. It is traversed by the Rio Feiquetinhonha, an upper branch of the Rio Belmonte; the small rivers of the W. part of the district fall into the Franceses. In this district about 2000 persons are employed in collecting the stones by the government; and according to Escwege, the diamonds collected between 1730 and 1822 were of the value of about 200,000 ducats. The diamonds are of all sizes and kinds.

He thinks that the value of what has been smuggled out of the country was probably less than this amount before the arrival of the royal family in Brazil, and that it afterwards doubled, owing to the more easy communication between the coast and the interior. According to Escwege, the whole quantity of diamonds has been valued at the lowest price, that is, as stones weighing only one carat; and it may therefore be presumed that the real value was at least double what he has given.

The small town of Abaeté on the Abaeté and Indus, both of which join the Franceses on the left bank, between 18° and 19°, there is another diamond district, which some years ago was worked but soon abandoned. In the Rio Abaeté was found, in 1791, the great diamond which weighs 1334 carats, and is called the Parana diamond, the plain of the Rio Paraná diamonds was found in the Tabajá, which falls into the Paranapanema, a tributary of the Pará, whence it is said they are smuggled out of the country. The yellow topazes found near Villa Rica are much esteemed.

Brazil could not maintain its immense stock of cattle if the people were obliged to buy salt, without a supply of which the animals will not thrive. The table-land does not contain rock-salt, but a great number of small patches occurs on the surface covered with a salt efflorescence, which the negroes and their wives till, and till them; but usually exceed a few square yards, double the value of an estate. In other places salt springs occur, and serve the same purpose. There are also salt steps, which resemble those on the high land of Iran in Asia. Two of them are very extensive: one runs, on both sides of the Franceses, between 17° and 18° S. lat. from the Villa de Urubuí to the Villa de Ioaizeio, with an average breadth of from 80 to 100 m.; the other is situated near the W. boundary of the empire, between the Paraguay and the Serra de Agaspély, beginning on the banks of the Agaspé, and extending for a distance of about 150 m., across the plateaus, through which it flows, to the Alto de Psagély, a great distance. In both districts the surface is slightly undulating, and the salt which appears on the surface after the rains is extracted by washing the earth, and leaving the water to evaporate. In some places, along the Franceses, and in the prov. of Seará, large caverns occur, the soil of which is impregnated with saltpetre. In other places, more especially on the Rio de Feiquetinhonha, alum is found in abundance.

The inhabitants of Brazil consist of aborigines and of foreigners, who have settled here in the last three centuries. The aborigines are divided into two main tribes, the Tupi and the Tupinambas. They are so far resembling another one another in figure, complexion, and habits, as to appear to belong to the same race. They are of a middling size and of slender make. Their complexion is a shining light copper colour, which sometimes passes into a yellowish tinge on their faces; their noses are thin, their eyes small, dark brown, and placed a little oblique; their cheek bones are prominent. All these characters indicate a resemblance to the race which inhabits the E. parts of Asia. They have little hair on the chin. It is remarkable,
that these tribes agree so well in their external characteristics, they have all a different language, even if a tribe consists of only a few families, which is sometimes the case. It is true that most of these languages contain some common roots, but the relationship is not so close that one can be easily understood or learned because another is known.

2. The aborigines of Brazil cultivate the ground and plant two kinds of mandioc, bananas and a species of rice. They have likewise divided their hunting and fighting grounds, and marked these divisions by boundaries. Still they derive the greater part of their subsistence from the chase, the wild fruits of the forest, and from fishing. In some tribes the men and women go naked, in others the women are covered with leaves and grass, and the men wear only a loincloth and eat their enemies, a fact well ascertained of the Boto-cudos in Espirito Santo. But modern writers do not state that they kill their parents or relations and eat them, like the Batuas of Sumatra. Most of them seem to have a very imperfect idea of a Supreme Being, but they generally believe in an evil Spirit. The number of these savage tribes probably exceeds 200 at least; Martius has enumerated 210; many of them consist of only one or two families. This is particularly the case with the tribes in the plain of the Amazon, and those which live in the interior are completely isolated, and at great distances from one another. To the S. of that riv. the tribes are much more numerous, and often consist of several thousand individuals. The Mundurucas on the Tapajós are said to amount to 13,000, and those on the Tocantins, to 10,000; the Paraguai, to 12,000; the Cajapos on the Paranaubahy, an affluent of the Paraná, to 8000; and the Chereotes on the Araguay, also to 8000.

All the aborigines, who lead an independent and roving life, are divided into three larger parties, or classes; the tradistinction to the Indians mansos (domesticated Indians), who have settled among, or in the neighborhood of the Europeans. It has always been the policy of the government to induce a number of Indians to live in one place, and to accommodate them to agriculture. Some are forced to do so, on account of the measure of health and the饮水 and civilized effect, or if they have, it has been observed that the Indians wasted away under numerous diseases, or returned at last to their former habits of life in the deep forests. Still there is a considerable number of these domesticated Indians, especially on the coast, where they perhaps amount to 400,000 individuals, as Freyrejeus conjectures. They were brought together by the Jesuits, and induced to settle in villages, called in Portuguese aldeas, where they were accustomed to agricultural labor. But on the suppression of the Order, the inhabitants left the abandoned settlements to the woods, where they now cultivate a piece of ground, hardly sufficient to give them a bare subsistence, and employ their time chiefly in fishing and hunting. Their huts are better than those of the savage tribes, and they profess Christianity.

The foreign settlers are either Portuguese, or negroes from Africa who have been brought over as slaves, and for the most part are still in a state of slavery. The Portuguese and the negro have intermingled with one another, and with the aborigines. The descendants of Europeans and negroes are divided in Brazil into two groups, Mulatas, and those of the Europeans and aborigines, Mamelucos; and those of the negroes and Indians, Cariboces. The offspring of the Mulattos and negroes, who are called Cubras, are also very numerous. The descendants of the negroes are called in Brazil Creoles. The European and African slaves are valued for their quiet disposition and their honesty.

The whole population of Brazil is variously estimated, from three and a half to five or six millions; but the different independent aboriginal tribes, which still possess more than half of the land, are not taken into account. It is conjectured that the negroes may amount to about two millions, of which number more than three-fourths are slaves; and the descendants of Europeans to somewhat more. The remainder are Mulattos, Mamelucos, Cariboco, Cubras, and/or.

Brazil is divided into nineteen provinces, of which fifteen are situated along the ocean, and four in the interior. Along the coast, beginning from the S., are the following provinces:

1. S. Pedro do Rio Grande do Sul comprehends the sandy plain that stretches along the shore from the boundary of the republic of Uruguay Oriental to the Rio Mambituba, a small riv. which enters the sea S. of the Morro de S. Marta, and also the whole country between this plain and the Rio Uruguay. This prov. is rich in cattle and horses, produces the grains of Europe and rice, as well as sugar cane and coffee, and is inhabited by the most N. districts along the Rio Uruguay there are still a few sejile tribes of independent Indians.

S. Pedro, the only harbour of this prov., is situated some miles from the mouth of the Rio S. Pedro, on a sandy plain of land. As vessels cannot approach near it, they remain on the E. bank of the riv. at a place called S. José. S. Pedro contains between 3000 and 4000 inhabitants, and carries on an active trade with Rio Janeiro. Porto Alegre, the capital of the prov., situated on a bay formed by the mouth of the Guaiahy, is well built, and contains between 7000 and 8000 inh.

2. S. Catharina comprehends the hilly country along the coast between the Rio Mambituba and the Rio Safy, which separates it from S. Paulo, and also the island of S. Catharina: it lies between 29° 30' and 25° 50'. Here the grains and fruits of Europe are cultivated together with those of a better climate. It does not appear that there are any free native tribes in this prov., but they sometimes enter it from the W. side of the mountain-ridge. There are some Spanish settlements, but the principal port is the harbour formed by the is! of S. Catharina. The is! of S. Catharina is above 30 m. long from N. to S., and from 4 to 8 m. wide; its surface presents a succession of hill and dale, and a great part of it is covered with fine trees; it abounds with lakes and rivers, and is separated from the mainland by a strait, which in its narrowest part, where it is formed by two projecting capes, is not more than 200 fathoms wide. These capes divide the strait in two large ports, almost equal in size, and both very safe. The N. port is called S. Catharina; the S. port is called Nossa Senhora do Desterro, the capital of the prov., is on the W. side of the is! upon a bay, a little to the S.E.S.E. of the narrowest part of the strait. It has between 3000 and 4000 inhabitants, and has mosses, and cotton cloths, and of pottery. Many spermaceti whales are taken in the strait, and the oil is prepared in several places of the is! and the adjacent mainland. Laguna, on the continent, has a harbour for coasting vessels, and exports grain, which is raised in the interior.

S. Francesco, near the boundary of the prov. of S. Paulo, and on an is!, has also a harbour for smacks, and exports grain and a great quantity of timber and cordage.

S. Paulo extends over the greater part of the plain of the Parana and over the Campos da Vacaria, and the sea-coast from the Rio Safy to the bay called Angra dos Reys. On the table-lands cattle and horses are raised in great numbers, and grain, manioc, and rice are cultivated and exported. On the coast, and a little coffee, are raised. The W. districts, along the Rio Parana, from the mouth of the Rio Tiete to that of the Iguacu, are still in possession of independent tribes; and the country to the N. of the Tiete is exposed to invasion from the Chajapés, a people hostile to any good seeking vessels, and some thriving towns along the coast.

Iguape, with 5600 inh., exports great quantities of rice. Santos, the port of the town of S. Paulo, to which an excellent road leads over the mountains, is on the N. side of the is!, called Ilha Grande. It has a good harbour capable of receiving men-of-war. It has above 7000 inh., and carries on a very considerable trade. On the same is!, but on the S. shore is the town of S. Vincente, the first establishment of the Portuguese in Brazil; it is now only inhabited by fishermen. S. Sebastião, farther to the E., is the seat of the is! and has more than 2 m. wide, and separates the is! of S. Sebastião from the continent. The town has a harbour for coasting vessels, 4500 inh., and exports timber and grain. Besides the town of S. Paulo (S. Paolo), which contains between 50,000 and 60,000 inh., there is another town of the same name in the interior. Sorocaba and Curitiba. Sorocaba, situated to the W. of S. Paulo, has 11,000 inh., and considerable trade in cattle and grain. In its neighbourhood is the Morro de Ararasaba, which is several miles in circuit, and consists entirely of iron ore. Curitiba, on the N. skirts of the Cam-
pos da Vacaria, is said to have a pop. of 12,000. It sends the produce of that country to the coast.

Alagoas, a port near it, commands a very extensive water-communication, which unites the most W. districts of Brazil with the coast; but it is now much less used than formerly.

4. Rio Janeiro, comprehending the coast between the W. extreme of the bay, called Angra dos Reis, and the mouth of the Rio Capanéu, extends from 50 to 60 m. inland. It belongs to the greatest portion of the Serra do Mar; and the Serra de Mantigueira stretches along its W. boundary. It is mountainous, but contains also extensive valleys. The greatest part of the province is inhabited; but rice, mandioca, and maize, are extensively cultivated. Coffee is raised to a greater amount than in any other prov., and cotton is also largely raised. Savage tribes occur only to the N. of the Rio Paraíba. It has some excellent harbors, including the Bay of Rio Janeiro. The latter is formed by two isl., Ilha Grande and Marumbaya, lying in a parallel line with the coast, and contains some excellent roadsteads. Two of its three entrances are from 5 to 8 m. wide, with a depth of about 30 fathoms. This prov. does not contain any considerable town except Rio Janeiro, the capital of Brazil. [Rio Ja-

5. Espirito Santo extends from the Rio Capanéu to the Rio Belmonte along the coast, and from 60 to about 100 m. inland. The districts are not very extensive; but the north part of the prov. consists of extensive low plains. A small portion of it is under cultivation, and produces sugar, cotton, rice, mandioca, and maize in abundance. Fish abound along the whole extent of the coast. The prov. district, as well as the independent towns and parishes, differ from the rest of Brazil by the B. peoples being distinguished by their bravery and cannibalism. Along the coast are the isl. called the Abrolhos. It has some harbors, but only fit for trading vessels, Victoria, or Nossa Senhora de Victoria, the capital, is the place of residence of the B. peoples. Another prov. is the riv. Caravellas, which is only an arm of the sea extending 10 m. inland, of considerable width and very deep; but the entrance is only accessible to small vessels. The town, which contains about 4000 inh., ships chiefly mandioca, flour, and fish, the gardens being taken in great numbers near the Abrolhos and the reef extending E. of them. Porto Seguro, near the mouth of the small riv. Buruhen is a considerable place, with a good but not deep harbour. Its inhabitants are principally occupied in the garapa fisheries.

6. Bahia. [Bahi; St. Salvador.]

7. Sergipe d'vel Rey comprehends the country to the N. of the riv. Rio Real, as far as the embouchure of the Francisco, and 140 m. inland. Its surface is a plain, with the exception of a few hills; but the W. portion is considerably higher than the E., which is covered with forests, intermingled with patches of cultivated ground. The W. country is generally stony, with few woods or fertile tracts, and very deficient in water. It supplies only very scanty rice for exportation. The gardens are planted with sugar and cotton are numerous. There are no independent tribes in this district. The harbours are formed by the mouths of the rivers, which are neither large nor deep.

Sergipe, the capital of the prov., is situated near the riv. Paramirim, an arm of the Rio Vazabares, 18 m. from the sea; coasting vessels come up to the town. It has a sugar house, a manufactory of tobacco, and some tan-pits. The pop. is stated by Schaffer at 30,000, but this seems an exaggeration. It is an active commercial town in the prov. 18 m. from the sea on the Rio Real, carries on an active commerce in the produce of the country.

8. Alagoas (D. Anna) extends along the shore from the mouth of the Francisco to that of the small riv. Urubu, and is about 140 m. inland. It resembles in aspect the prov. of Sergipe, the W. districts being sterile, and producing in the E. districts the same articles, with tobacco besides. There are no independent tribes in this province. There are two good harbours, the united ports of Jariagu and Pajus-
sara, and the bay of Curupiru. Alagoas, the capital, is on the S. side of the lake of Manguaba, which is 30 m. long, 20 m. wide, the widest part, and is situated on the E. coast of the prov. by the riv. Alagoas. Porto Calvo, situated upon the margin of the riv. bearing the same name, 20 m. from the sea, exports a great quantity of dye-woods. Penedo de S. Francisco, a populous and commercial town, on the banks of the Francisco, about 25 m. from its mouth, contains 11,000 inh.

9. Pernambuco consists of two parts, one on the coast, and the other on the table-land. The latter is distinguished by the name of Serra de Pernambuco. The country along the short coast extending below the riv. Una and Goyana is in general flat, but farther inland it presents a succession of hill and dales, intermixed with some level grounds of considerable extent. Where it approaches the Serra the surface is stony and sterile. The Serra, which extends along the coast, is a range of hills, the highest of which is 2000 m. above sea level. The prov. of Bahia and Goyaz, as far as the Rio Carinheba, an affluent of the Rio S. Francisco, (near 15° S. lat.) is a portion of the table-land of Brazil, and comprehends the greater part of the salt steppes already described. Other portions however afford excellent pasture for cattle, and on the banks of the prov. the plantations of cotton are rapidly increasing. Besides the common productions of tropical climates, sugar and cotton are cultivated, and dye-wood is got in the forests, nearby 100 m. from the sea. The indefi-
nate climate of the coast has subjected the prov. to many changes. Several of the villages have lately been subjected or expelled. The numerous harbours are only adapted for small craft, except those of Cat-

10. Recife is the port of the prov. It contains about 50 m. at its widest from E. to W. More than two-thirds of its surface have an arid soil and are not cultivated. The cultivated lands are in the vicinity of some rivers and on the mountain-ridges, which are generally covered with trees and have a strong soil. The principal products are sugar, cotton, mandioca, maize and tobacco, with excellent fruits. Its few ports can only receive small vessels; but from Cape Branco a reef extends nearly 18 m. N., between which and the coast there are 9 and 10 fath, water, in which vessels can ride in safety.

Parahyba is on the right bank, 10 m. above the embouchure of the riv. of the same name, which, though about 3 m. wide at its mouth, allows ships to ascend only for 3 m.; nothing but smacks can come up to the t., which contains about 12,000 inh., and its commerce in the produce of the prov. is considerable.

11. Rio Grande do Norte extends along the coast from the bay of Marcos to a range of hills called the Serra de Ap-

12. Natal, the capital of the prov., is advantageously situated on the right bank of the Rio Grande, near 2 m. above its mouth. It has also an easy communication with the inland districts, the riv. being navigable for large vessels near 40 m. from its mouth. The prov. is not very extensive, and its pop. is about 18,000. The Island of Fernando de Noronha, 3° 30' S. lat., about 250 m. E. N. E. of Cape S. Roque, belongs to this prov. It is 10 m. long, generally hilly and stony, with a few small portions of land capable of cultivation. Convicts are transported here.
12. Seara, or Ceará, extends from the Serra Appody to the Serra Hibiapaha, which terminates between the riv. Camucim and Parnahybas, in hills not far distant from the sea. It is separated from Pirayu by. It is computed to measure, from N. to S., 132 m. of Pará and Roraima. This riv. is generally uneven, but the valleys are wide and not deep, the elevations are not great, except towards the S. and W. boundary-line. The soil is in general sandy, arid and sterile, except on the broad summits of the mountains, where it is rich and covered with forests. In the department of the Seara and mandicas are cultivated. Along the rivers coton is grown. The district about the upper branches of the Rio Jaguari, the principal riv. of the prov., is the most fertile and productive. This prov. often suffers much from long droughts. The descendent of the native inhabitants are numerous, especially in the less fertile districts. The Indians in some parts are steers, in others flat and sandy, have no ports except for small coasting vessels.

Seará, the capital, is situated near the beach, about 7 m. N. W. of the mouth of the riv. Seará. It has no harbour, about 10,000 inh., and very little commerce. Aracatá, on the E. bank of the Jaguari, 8 m. above its mouth, is the most commercial and populous town in the prov. It has 24,000 inh., and exports cotton and hides in large quantities. The tide, which runs 30 m. up the riv., facilitates the navigation. Sobral, not far from the bank of the Camucim, the second town in commerce and pop., is about 70 m. from the sea. Its port is Granja, on the left bank of the Camucim, 50 m. from the sea.

13. A considerable coast of about 60 m. between the Serra Hibiapaha and the mouth of the Río Parnahybas, which riv. divides it from Maranhão; but it extends 400 m. inland to the source of that riv. This prov. is only hilly on the boundary-line of Seará and Pernambuco; it is particularly in the interior, is not watered by any important succession of the southern portion of the plain of the Parnahybas being extensive and excellent. Besides cattle, cotton is exported, and, in addition to other grains, rice and mandicado are particularly cultivated. Independent tribes still exist in the S. district, and the Parnahybas, deceptively named, is not a port, except that formed by the E. mouth of the Río Parnahybas, called Higuarauss. Oeiras, the capital, is situated on a small riv., which, three m. lower down, falls into the Canindé, a tributary of the Parnahybas. It is a small town with 1,700 inh. Parnahybas lies on the Higuarauss, the E. and most considerable branch of the Parnahybas, 15 m. from the sea, and carries on an active trade in hides and cotton. Its pop. amounts to 2,600.

14. Maranhão comprehends the western portion of the plain of the Parnahybas, being bounded by the coast 350 m. from the western mouth of the Río Parnahybas to that of the Tuyuruass, and nearly 400 m. inland. It is more hilly than Piauí, especially in the S. districts, but towards the sea extremely productive in rice and cotton, which are exported in large quantities. The Seará delimits the prov. on the S. and the Tuyuruass, forming all together perhaps more than half the prov., are still occupied by independent tribes. It has some good harbours. The best of which are the bays of S. José and of S. Marcos, formed by the isl. of Maranhão, which is 20 m. long from S. S. and 15 m. its greatest width. To the W. of the bay of S. Marcos, the shores are skirted by a series of small and low islands up to the bay of Tuyuruass, the limits of the prov. on the side of Pará. Besides the capital, S. Luiz de Maranhão [Marañon, Mora], a portion of the Tuyuruass and Cachicas. Alcantara, on the W. of the bay of S. Marcos, which has a port capable of receiving large coasting vessels, is a large well-buit town, and carries on a considerable trade in the produce of the country. Cachicas is situated on the Itaupur, where that riv. begins to be navigable for large barges, in a district which is productive in cotton; it is a considerable thriving town. Its pop. may amount to 10,000.

15. Pará is the largest of the prov. of Brazil, extending from the riv. Tuyuruass, W. near to the isl. of Tupinambarana, along the S. bank of the Amazonas; and farther to the S. to the E. bank of the rio Madeira. This portion of Pará comprehends the greater part of the plain of the Rio das Amazonas, and also considerable portions of the table-lands, nearly the whole of it is still in the possession of independent tribes, the European settlements being very small and at great distances from one another. They only occur on the banks of the rio das Amazonas, and at the mouth of its larger affluents. On the banks of the tocantins and Madeira, which two rivers have been navigated for some time, there are also a few feeble settlements, but none on those of the Xingu and Tapajos, nor on the rivers between the Madeira and Tapajos. Some attempts have been recently made to navigate the Tapajos, but the obstacles and difficulties may be made on that riv. In this portion of the prov. of Pará, is the capital, Pará [Pará], and the following places:—Braganza or Cayté, on the banks of the riv. Cayté, about 20 m. from the sea, is an old town and a considerable place; the town is seated on a reservation land, which navigate between Maranhão and Pará. Cameta, the most considerable t. next to Pará, is situated on the left bank of the tocantins, above 50 m. from its mouth. It has considerable trade with Pará and the prov. of Goias, and about 6,900 inh. Sanhaua is the mouth of the Tapajos, 20 m. from the mouth, and depth of the numerous articles of commerce collected in the forests around it and farther up the Amazonas; it is also visited by barges which navigate towards the country farther W. It has about 2,000 inh. The prov. of Pará comprehends also a considerable tract N. of the Amazonas, from the E. coast to the Rio Nhamunda. This tract, which is considered as part of Guiana, is almost entirely occupied by independent tribes. The few European settlements only occur on the west coast and on the banks of the Río Amazonas. The most considerable places here are:—Macapa, at the mouth of the can. of Braganza, the principal branch of the Río Amazonas, opposite the Archipelago of Isl. which that great riv. forms here. It is a large port, and carries on an active commerce in the produce of the country. Its pop. is 2,000. Montalegre, situated on a small isl. in the riv. Guarupeu, 7 m. from its junction with the Amazonas, is a considerable place, and has some trade. Óbidos, formerly a principality, is on the Río Oromina, which joins the Amazonas. In this place, at the distance of about 700 m. from the sea, the Amazonas runs in one channel, about 900 fathoms wide, and up to this point the tide ascends. It has some commerce and nearly 2,000 inh.

The prov. between Tucumán and Cape Norte is a narrow channel extends along the coast, which is formed by some islands that line the coast at a short distance from it; in this channel the current called poroboca, is most strongly felt. At full and change, the tide, instead of gradually rising in six hours, attains its greatest height in a few minutes, and is accompanied with a terrific noise. [Bones.]

The isl. of Marajó or Iha dos Joannes is the largest isl. of Brazil, extending above 90 m. from N. to S., and at least 120 from E. to W. It perhaps contains about 16,000 sq. m. of land. It is surrounded by the Rio das Bocas, a fresh-water bay, at the E. extremity of which the Tocantins has its embouchure. This bay and the Rio do Amazonas, 200 m. S. S. of it, are both frequently used and its own numerous rivers, some of which have a course of 70 or 80 m. wide, and, in the rainy season, considerable tracts on the W. and S. side. About one-half of the isl., consisting of that part which borders on the ocean and the mouth of the Pará, is nearly without wood and pastured by great herds of cattle and horses; the other half is covered with high trees and abundance of underwater. The pop. is probably not much above 10,000.

16. S. José do Rio Negro, which is not much more than 6 m. distant from the mouth of the Madeira, is a small town, and lies near the N. side between the Rio Nhamunda and the limits of the rep. of Ecuador; on the S. between the Rio Madeira and the Hyabary, the limit towards Peru. The isl. of Tupinambarana is included in this prov., and also the country S. and E. of it. The European settlements here are still less numerous and less important, and are only found on the Rio Negro and its tributary, Rio Branco, on the Tapuara, and the Madeira, except a very few on the Rio Amazonas. The country between the Madeira and Hyabary has never been opened by the Europeans. N. of the prov. of Pará, and S. of it the numerous tribes of the Mundurucú, Mahés, Muras, and others. Barro do Rio Negro, the capital, is situated on the banks of the Rio Negro, about 4 m. from its mouth, and contains above 3,000 inh. Catacariru, on the Amazonas, situated near the boundary-line of Ecuador, is a very small place.

The isl. of Tupinambarana, which is above 150 m. long, lies near the S. bank of the Amazonas, from the mouth of
the Madeira W. Between it and the main land on the S. is a large, deep, and navigable channel, called can. de Irarí, into which many riv. empty themselves. When the Ma-
deira is swollen, the current runs through this channel E.; but in the dry season it runs partly in the channel of the Páu, and partly in the channel of the S. San Pedro, by different mouths. The isl. is low and covered with impenetrable woods. Nearly in the middle it is divided by a narrow strait called the Furo dos Ramos, which unites the Irarí with the Amazonas.

17. Matto Grosso (Great Forest) occupies the eastern part of S. America, in a position on the great eastern portion of the table-land between the Madeira and the Araguaui, the tributary of the Tapajos, the portion of the plain of the Upper Madeira belonging to Brazil, the plain of the Paraguay, and the W. portion of the plain of the Yanayacu, to the bank of the Rio de la Plata. A great portion of the table-land of the Serra dos Vertentes seems to be a desert of little value, of which the Campos dos Parecis are the worst part; and no Europeans are settled here. The table-land of the Paraná is better, and has extensive pastures; but it is still entirely possessed by the independent Indians, more especially the Cajapos. But on the riv. falling into the Paraguay, there are numerous European settlements, though they are generally small. In many places gold is found, which circumstance gave rise to the settlements, though the mines are at present unemployed or neglected. The low country on both sides of the Paraguay is mostly occupied by the Guaiacurús. On the plain of the Upper Madeira, along the banks of the Guaporé, there are also many European settlements: gold abounds here; but the greater part of the country is possessed by independent Indians.

Villa B'ella, the capital, a considerable town, situated near the Guaporé, has 25,000 inh. and considerable mines in its neighbourhood. Cuyabá, not far from the banks of the Rio Cuiabá, on the right bank of the Paraná, has 1,700 inh. In consequence, the inspection of the country, which is a tributary of the Paraguay, is noted for the quantity of gold which was found here in the beginning of the last century. It is still a considerable place, though the mines have greatly fallen off. Villa Maria, on the E. bank of the Paraguay, is a considerable town.

18. Guayos occupies the centre of the Brazilian table-land, including the basin of the Tapajos to its confluence with the Araguaui and the countries on the E. bank of the Araguaui, together with the hilly country on the Paranaiba, an affluent of the Paraná. European settlements are common only on some of the upper branches of the Tapajos and Araguaui, where gold was found in abundance. There are a few small settlements along the Tapajos up to its confluence with the Araguaui. By far the greater portion of the gold production of Independencia belongs to those which the Cajapos on the Paranaiba, and the Chevantes, between the Tapajos and Araguaui, are the most numerous. Villa Boa, the capital, situated on the Rio Vermelho, an affluent of the Araguaui, in a country rich in gold, contains 700 inh. The river do Paraguái, which forms the boundary near the ridge, which divides the affluents of the Tapajos from those of the Araguaui, is in the neighbourhood of some rich gold mines. Natividade, a town 35 m. from the E. bank of the Tapajos, is the most commercial place of the prov.; it sends its produce to Bahia.

19. Minas Gerais comprehends the E. and, as it appears, most elevated portion of the Brazilian table-land along the upper course of the Rio de S. Francisco, together with the most N. part of the table-land of the Paraná. It is rich in gold. Cotia is a considerable mine; on the W. of the E. Cotia, it has also considerable mines in its neighbourhood, and 2000 inh. S. João do Rey, on a small riv. which unites with the Rio Grande, the principal branch of the Paraná, has above 6000 inh. The gold vicinity is a rich mine, but it depends from the importance of the connection between S. Paulo and Villa Rica passing through it. Sabará, on the Rio das Velhas, contains 6000 inh. In its neighbourhood are considerable mines, among which are the rich mines of Congo.

Sóco. Tejuco, the capital of the diamond district, and the seat of its administration, is situated between high mountains, on the small riv. S. Antonio, which falls into the Tequeitinhoas: it has 6000 inh. In its neighbourhood is the Serra de Ouro, the road from S. Paulo to Rio Janeiro.

The communication between the prov. of Brazil is only easy so far as it can be effected by sea or the Rio Amazonas. The mountains dividing the table-land from the coast are in general steep and difficult to pass. There are only three roads over and down. The most E. of these leads from S. Paulo to Rio Janeiro, a carriage-road, and the best of all. Another road leads over the Serra da Mantigueira from Rio de Janeiro to Villa Rica, but it can only be travelled on horseback. The third, which runs from the banks of the Rio Araguaui to Jacobina, and from Jacobina to Bahia, is still worse. Between Goayz and the country further E. are two roads. One passes from Villa Boa to Villa Rica, and the other from Natividade to the Rio S. Francisco. The country further W. communicates with the E. prov. only by one road, which runs from Cotia to Villa Rica; another road connects Cuyabá with Villa B'ella. Before the last-mentioned road was made, the prov. of Matto Grosso communicated with Rio Janeiro by the way of S. Paulo, and by an inland navigation of great difficulty. Departing from Villa B'ella, the barges ascended the Rio Alegre, an affluent of the Guaporé, whose upper course is separated from the Rio Agraópehy by a portage of only 4800 yards. Hence they descended the Rio Agraópehy and Jauri to the Paraguay. From the Paraguay they entered the Paraná, and at the point afterward called the Campaú, where the navigation on this riv. ceases, there is another portage of 7 m., by which the riv. Sanguijua is reached. This riv. unites with the Vermelho, and both fall into the Rio Parado, a tributary of the Paraná. The Paraguay is now in European hands. The latter riv. was then navigated as far as Porto Feliz. The remainder of the road to S. Paulo and Rio Janeiro was by land. This route has been almost abandoned since a road has been made between Cuyabá and Villa B'ella; a road to Porto Alegre, via Cuiabá and Villa Boa, or Villa Rica; and another passing through Oeyras and Cachias connects Bahia with Maranhão.

The navigation on the Rio das Amazonas and on the Parnahyba is easy, but on the Madeira has been almost entirely abandoned, on account of the great number of cataracts. The Tapajós and Araguaui are navigated with difficulty; but the Tapajós seems to present fewer obstacles.

Commerce of Brazil. The scarcity of the means of inland communication prevents the prov. of Matto Grosso and Guayos, most of the mining districts; but from 1829 bringing their agricultural produce to any market, and their export is consequently limited to gold and diamonds. Minas Gerais, which is connected by tolerable roads with Rio Janeiro, Bahia, and S. Paulo, and also enjoys the select position of having a direct road to the S. Francisco, exports its gold and precious stones, and also coffee and cotton: S. Paulo exports its bulky and heavy products by the port of Santos.

The foreign commerce of Brazil is more extensive than that of any other country of the Americas, except the United States. The vessels of all nations are admitted on the same conditions, and their cargoes pay the same duties. The most important articles of exportation are sugar, 1,500,000 cwt. annually; coffee, 750,000 cwt.; and cotton, from 230,000 bales to 250,000 bales. Rice, tapioca, hides, tobacco, rice, and orange, dyes, wood, sarsaparilla, and indigo is also considerable. The smaller articles are iecnic, indigo, castor-beans, castor-oil, and different drugs.

The following are the ports frequented by European vessels. From S. Pedro in Bahia, S. Francisco is exported three-fourths of all the hides brought from Brazil; formerly they were sent chiefly to Rio de Janeiro, and a few to Bahia, but now a considerable portion is exported direct to Europe, and chiefly to Anwerp. The greatest part of the hides exported from the slave trade goes to Europe, and the slaves in the S. prov. of Brazil; but a part is exported to the Hamburg, as well direct from S. Pedro, as from Bahia and Rio Janeiro. Wheat and tallow go to Rio Janeiro. Santos sends the numerous productions of S. Paulo to Rio de Janeiro; and the few cargoes of sugar exported to Europe, chiefly to Lisbon: a considerable part of the sugar exported from Rio Janeiro is brought from Santos.

Rio Janeiro exports a great quantity of coffee, which now
amounts to 550,000 bags annually, being ten times the quantity exported from all the other Brazilian ports. It is sent to all parts of Europe, chiefly to Antwerp, Hamburg, and Lisbon, as well as to the United States. Next to coffee, sugar is an important export, being from 16,000 to 18,000 cases annually; it goes almost entirely to Europe, and chiefly to Hamburg; but when European prices are low, part of it has occasionally been sent to Buenos Aires, Brazil. Other exports are hides, brought from Rio Grande do Sul and S. Paulo, rum, dye-woods, and drugs; the first two are considerable.

Bahia, or S. Salvador, is the principal port for the exportation of sugar, which annually amounts to from 50,000 to 60,000 bags. These exports are chiefly of some tobacco, rum, rice, cassava, rosewood, and drugs. The sugar goes principally to Hamburg and Trieste, and the cotton to England, a small portion only being sent to France. To Lisbon and Oporto are sent part of the sugar, tobacco, rum, and cassava, and all the rice; and to the coast of Africa much rum and the inferior quality of tobacco.

Pernambuco supplies cotton, sugar, and Brazil-wood. The cotton, amounting to above 100,000 bags annually, comes mostly to England; the sugar being less fit for refining, is distributed in small portions to many markets: it amounts to about 15,000 cases. The Brazil-wood of best quality is found in the neighbourhood of Pernambuco, and is exported on account of the government, which has a monopoly in it. Though this article is also found in the prov. of Rio Janeiro and Bahia, these exports are only a small number.

Cape S. Roque as to bear no comparison in value. The smaller articles are hides, cocoa-nuts, peacucanuha, and other drugs.

Maranhão exports chiefly cotton, rice, tapioca, hides, and hogs' tallow and some drugs. The cotton, amounting to about 50,000 bags, goes chiefly to England (36,000), and the remainder to Portugal and Spain. The rice and tapioca (maniocca flour) is sent to Portugal. The hides (100,000) are divided between England and the United States. Brazil and Belgium are the only small traders in it. What is called Maranhão cassava is the produce of Pará, and is not now exported at all from Maranhão.

Pará, though a larger town than S. Pedro and Santos, is a place of much less trade: its exports consist of a greater value than its imports. It is the second port of Brazil, and its trade is only a small number. What is called Maranhão cassava is the produce of Pará, and is not now exported at all from Maranhão.

Pará, though a larger town than S. Pedro and Santos, is a place of much less trade: its exports consist of a greater value than its imports. It is the second port of Brazil, and its trade is only a small number. What is called Maranhão cassava is the produce of Pará, and is not now exported at all from Maranhão.

The white, nearly all the sugar of Brazil finds a market at Hamburg, Trieste, and Portugal; the rice, is, with a trifling exception, sent to Portugal; the coffee is divided between the continent of Europe and the United States, the latter having increased their imports to nearly one-third of the whole quantity in late years. Almost all the cotton, rosewood, India-rubber, and sisal grass is brought to England. The hides are distributed between England, the continent of Europe, and the United States. The tobacco is sent to Portugal and to Gibraltar, previous to being exported to England. The rum, which is exported, finds a market chiefly on the African coast, and in some parts of Portugal.

The annual exports from Brazil may be estimated at about 5,000,000, of which nearly one-half is chiefly to Europe, by British vessels; by the remainder about three-fourths to the continent of Europe in Swedish, Danish, Portuguese, and Hamburg vessels, and the rest is carried to America.

The imports into Brazil may likewise be estimated at about 5,000,000, mostly in the form of English vessels. Most of its goods are brought to Brazil, and its manufactures are sent to England. The most important article is cotton fabrics, which amount to nearly 1,500,000; next to these, woollen articles, linen, brass and copper ware, butter and cheese, iron and steel, wrought and unwrought, hardware, Belid cutlery, hats, arms and ammunition, books and candles, and tin. Many cargoes of cod are sent from the British fisheries in North America; and from the British colonies potatoes, India cotton piece-goods, silks and spices. Nearly the whole of this commerce is carried on by vessels from London and Liverpool.

France sends to Brazil, chiefly from the ports of Havre and Brest, some articles of fashion, trinkets, furniture, wax candles, hats, dry fruits, some glass goods, and wine. From Holland and Belgium are sent beer, glass goods, linen, paper; from Germany, Bohemian glass, linen, and iron and brass utensils; from Russia and Sweden, iron, copper utensils, sail-cloths, cords, ropes and tar; from Portugal, wine, brandy, fruits, hats, and European manufactures; from the United States, considerable quantities of salt, flour, rice, coffee, hemp, soap, sweets of candles, tin-foil, tar, leather, boards, pitch, potatoes, and some rough articles of furniture and coarse cotton cloth.

The maritime intercourse between Brazil and the neighbouring republics is not considerable. The most active is that carried on with British Buenos Ayres. Sugar, tobacco, and some other agricultural products are sent, and whence the Paraguay tea or mate is brought back.

Formerly an active trade was carried on with the coasts of Africa, whence, in some years, 25,000 slaves were imported, chiefly from Benguella, Cabilia, and Mozambique. But the slave trade has been abolished, and since that time the traffic has probably much decreased. From Mozambique are imported gold-dust, ivory, pepper, Calombo root, ebony, and some East India goods; from the western coasts of Africa, wax, palm-oil, ivory, ground nuts, sulphur, and some gum-arabic; from Cape Verde islands, sulphur, gum-arabic, and salt. The intercourse with Goa and Macao is not great. From these places are brought cotton pieces, spices, rice, tea, indigo, China tea, cinnamon, pepper, and some camphor. For some years after the opening of the Brazilian ports to free trade, nearly all the commerce was with England and Portugal; but on the general peace in Europe in 1814, the northern ports began to continue the trade.

As almost all the most important products of Brazil are excluded from consumption in England by enormous duties, other countries are gradually, though slowly, supplanting the British in the Brazilian trade.

The British trade with Brazil is on the whole greater now than ever it was, but it by no means comprises the same proportion of the whole of the Brazilian commerce. The whole trade of Brazil has certainly increased very considerably, and though the English share in this trade has probably been decreased, it is still a very considerable one. For some years British shipping carried nearly the whole produce of Brazil, but now it carries less than one-twentieth. North American, Hamburg, Swedish, and other flags have entered into competition with the British, and are beginning to usurp a share of the trade, desiring a larger share of the trade. The principal cause of this change is that the bulky articles, such as Brazilian sugar, coffee, and cacao, being loaded with heavy duties in England, are consumed wholly in other countries, and only sought to be imported for the convenience of these articles direct to the countries of their consumption, much expense is saved, and in doing this foreigners employ their own vessels. The only chance the British have for securing the important carrying trade in Brazilian produce would be by a material reduction of the duties in England.

History.—Brazil was discovered in the last year of the fifteenth century. The voyages of Columbus and Vasco de Gama, who first sailed across extensive seas, had taught navigators to adopt the practice of entering at once upon an open coast, without proceeding far inland. Pedro de Alvaraz de Cabral, who, after the return of Vasco de Gama, was sent by the king of Portugal with a large navy to the East Indies, directed his course from the Cape Verde islands to the S.W., according to the indications of Gama, and discovered that he found himself very unexpectedly in sight of land in 16° S. lat. This country was Brazil, which he saw first on the 3rd of May, 1500. He sailed along the coast as far as Porto Seguro (16° S. lat.), where he landed and took possession. From thence he bought the Algarve Indians, and continued his voyage to India. The king afterwards sent Amerigo Vespucci, a Florentine, to examine the country, who took a rapid survey of nearly the whole of its shores, and upon his return published an account of it, with a map. To this publication this navigator is indebted for the honour of having given his Christian name to the new continent.

Vespucci, and others who were sent somewhat later, reported that the country was not cultivated, and did not offer any great commercial advantages, but that they had found

No. 318.

[THE PENNY CYCLOPEDIA.]
extensive forests of Brazil-wood, of which they brought some cargoes to Portugal. This was not sufficient to induce the Portuguese to form a settlement, or to set up as traders or planters, as they did in the East Indies; but it was quite enough to induce mercantile speculators to send their vessels for the dye-wood. This trade continued for some years, and the merchants of other nations, especially the French, began to consider it seriously. They were encouraged by the Portuguese government as a violation of their rights as discoverers of the country, and they accordingly began to think of forming a permanent establishment. King John III. however, on calculating the expenses to be incurred by such an undertaking, thought it more advantageous to invest some of the richest noble families of Portugal with the property of extensive tracts of coast, for the purpose of colonizing them with Portuguese subjects. Accordingly, about ten or twelve Portuguese nobles were settled in the provinces already acquired—a few leagues of coast, and 40 or 50 leagues inland. These proprietors were called donatários. Most of them made great sacrifices, and underwent much fatigue and danger in forming settlements in Brazil. The towns of S. Vinzent, Espírito Santo, Porto Seguro, and Pernambuco were founded by them between 1531 and 1545. But it soon became evident that the private fortune of these noblemen was not adequate to the establishment of such settlements in an uncultivated country, and in the neighbourhood of weak and barbarous nations. The king, therefore, appointed the king of Portugal and governor to Brazil, Thomé de Sousa, who founded the town of Bahia in the bay of Todos os Santos, and established a regular colonial administration. The government gradually found means to acquire the property of the colonies belonging from the donatários, either by purchase or barter.

Before the religious divisions in England began to people the coasts of North America, the Protestants of France made a similar attempt in Brazil. A colony of French Protestants was established in 1565 in the bay of Rio Janeiro, by Nicolas Durand de Villepagnon, but it soon fell into anarchy. The Portuguese attacked it in 1565, and expelled the French, though not without encountering considerable resistance. On this occasion the town of Rio Janeiro was destroyed by the Portuguese.

On the death of King Sebastian, when Portugal was united to Spain (1580), the numerous enemies of the latter country began to annoy Brazil, among whom the English, under Thomas Cavendish, were the most active. They did not however form any settlement. The French made a second attempt in 1612 to settle on the isle of Maranhão, where they founded the town of S. Luís de Maranhão, but in 1615 they were compelled to abandon it to the Portuguese. The Dutch were more formidable enemies to the Portuguese, for they took possession of many settlements in the Indian seas, and their West India Company was thus invited to similar attempts in America. In 1633 they sent a fleet to Brazil, which took Bahia, then the capital of the country; but it was lost again in 1639. In 1629 the Dutch made another attempt, and possessed themselves of Pernambuco, from which the Portuguese were unable to dislodge them. They also extended their conquest S. to the mouth of the Francisco, and added on the N. the prov. of Paraíba and Rio Grande do Norte to the dominions of the king of Portugal, and the disunited officers appearing to be the principal obstacle to the completion of the conquest of all Brazil, the company sent, in 1637, Prince John Maurice of Nassau to Pernambuco, with unlimited powers as governor. He soon established a more regular administration, and the Portuguese government of Portugal made peace with the Dutch republic. But Nassau did not trouble himself about the orders received from home, and in 1641 and 1642 he took the prov. of Seregin and Pernambuco, so that when he was recalled, in 1643, all that left N. of the Francisco were Dutch, with the exception of the prov. of Paraíba, and in addition to this the prov. of Seregin, was in the hands of the Dutch. The administration of the Dutch colony being left to a council at Recife, every thing soon fell into disorder. The Dutch governor at Bahia was prevented by the peace, and the orders received from his government at home, from taking advantage of these circumstances; but a private person, Fernandes Vieira, formed a conspiracy to seize the city of Bahia, which he was secretly aided by the governor. The conspiracy broke out at Maranhão and Seara, and extended gradually to the other provinces. At last the Dutch were confined to the town of Pernambuco, from which they were expelled in 1643, for the Portuguese government sent a naval force to aid the people who had risen against the Dutch. By the peace of 1668 the Dutch renounced their claims on these countries.

At that time the mineral riches of Brazil were not known. The town of S. Peter in Gallicantu was founded by some Portuguese in 1629, who had ascended to the table-land of the Paraná from the town of S. Vincent, and been induced to settle there on account of its fine climate. The adventurers established a kind of democratic government, and made the place a sort of independent state, in the hope of capturing them and using them as slaves. In these excursions, towards the end of the seventeenth century, they discovered the mines of S. Paulo; and near Saborá, on the Rio das Velhas, in 1700, the richer mines at Villa Rica; and in 1713 those of Maranha. The mines at Cuyabá and Goyaz were discovered between 1715 and 1720. The existence of diamonds in the Rio Icutinbonha was not known before 1728. These discoveries, and the riches which government derived from the mines, induced it to remove the administration of the colony from Bahia to Rio S. Janeiro in 1773.

Brazil has not attained that degree of cultivation and amount of pop. which might have been expected in a colony settled for upwards of 250 years. The principal impediments to the prosperity of Brazil has been the smallness of the population, sometimes 100 or 200 sq. m. and more, and the proprietors not having pains to settle these extensive tracts with a sufficient number of labourers. Another obstacle has existed in the regulations as to commerce, by which no foreign vessel was allowed to enter for the purpose of transporting Brazilians to send their commodities to any other country than Portugal. This of course caused discontent among the merchants. Further, the natives of Portugal who had emigrated to the colony constituted a privileged class, being permitted to hold all public and military employments under government, which naturally excited dissatisfaction among the rich descendants of the Portuguese. This dissatisfaction began to generate a wish for change as soon as the U. S. of North America had obtained their independence; and events in Europe took such a turn that Brazil obtained its object almost without bloodshed and war. When Bonaparte had formed his scheme for taking possession of the Peninsula, he began by declaring war against Portugal, upon which the royal family left Eu
eropa, for Brazil. Consequently Brazil was in a position to take advantage of the situation. Considering Brazil as the principal part of his remaining dominions, King John VI. began to improve its condition by placing the administration on a more regular footing and throwing open its ports to all nations. In the meantime the French army, after having occupied Portugal for some time, was driven out of Spain, and though all apprehension of seeing Portugal again conquered by the French was now removed, the royal family did not return to Europe. On the fall of Bonaparte, the king raised Brazil to the rank of kingdom, and in 1821 he died. In 1822 the country was occupied by the British under Lord Algarve, and the prince regent, Algarve, and Brazil. The inh. of Portugal, finding themselves deprived of the advantages of an exclusive commerce with that country, were much discontented, and it was said that an insurrection, which broke out at Pernambuco in 1822, was excited by the Portuguese government for the purpose of protecting the country from British occupation. The king was however obliged to return to Europe by the revolution which took place in Portugal in 1828, by which the constitution of Spain had been adopted in that kingdom also. The news of this event had hardly reached Brazil when a revolution took place there demanding a stronger government, and the constitution of 1824 was proclaimed by the inh. in the town of Pernambuco, and soon afterwards in Bahia and Pará. It was feared that similar measures would be taken in Rio Janeiro, and accordingly the king found it expedient to proclaim the constitution himself on the 28th of January, 1822, at the seat of government, which was then situated at the head of the administration in Brazil Pedro his eldest son and successor, as lieutenant and regent. The Cortes of Portugal did not conceal their design of restoring the old relations with Brazil, by which its commerce was restricted to the mother country; and they did not treat the
deputies from Brazil quite so well as they should have done. This of course increased the discontent of the Brazilians, and prepared the way for the independence of that country.

The Cortes in Portugal continued their course of policy. They formed a scheme for a new organization of the administration in Brazil and recalled the Prince Regent. But the prince, induced by the representations of the Brazilians, rejected the offer, and the prince and court were finally stationed at Pernambuco and Rio Janeiro to Europe. The Portuguese commandant of Bahia however did not yield; he expelled the militia and remained master of the town. This step was decisive, and immediately followed by others. On the 13th May the Prince Regent was proclaimed protector and perpetual defender of Brazil. The general procurators (Procuradores gerais) of the prov. were assembled by the Prince Regent to consult on the new form of government, but they declared that they were not competent to such a task, and proceeded to choose a new Cortes chosen by the people, to which the prince acceded after a short delay. As the Cortes in Portugal still persisted in their design it was thought necessary to declare the independence of Brazil, and the Prince Regent did not venture to oppose the torrent of public opinion. Accordingly on the 12th of October, 1822, Brazil declared an independent state, and the prince adopted the title of Emperor of Brazil; on the 1st of December he was crowned.

As this step might be considered a declaration of war against Portugal, the president of the Cortes forbade the troops from marching. The Portuguese troops still occupied the towns of Bahia, Maranhão, and Para. Bahia was besieged by the Brazilian forces, and after a few days the garrison was obliged to abandon it, upon the appearance of the admiral and the new forces. The admiral also conquered the garrisons of Maranhão and Para, sailing for Europe. Thus the independence of Brazil was established, with no other loss of blood than what took place in the town of Bahia.

The Cortes of the prov. met on the 3rd of May, 1823, the anniversary of the discovery of Brazil, and adopted the title of General Assembly of Brazil (Assemblea Geral do Brasil). They appointed a committee for drawing up a constitution, which was done by the 30th of August; but this constitution contained several provisions to which the emperor objected. The meetings of the assembly becoming more and more turbulent, the emperor finally dissolved it on the 12th of November, and called another assembly. In the mean time he caused a new constitution to be drawn up, which he approved, and ordered a new assembly (1824). According to this instrument, Brazil is an hereditary monarchy, limited by a popular assembly. The executive is in the hands of the emperor. The legislative body consists of two assemblies, the senate, and the chamber of deputations. On the 1st is the emperor, and the second by the people. The Catholic faith is the religion of the state: all other Christians are tolerated, but are not allowed to build churches, and to perform divine service in public.

During these events the Cortes of Portugal had been dissolved, and the constitution abolished. The king, after some slight attempts, being well aware that it was impossible to re-establish the former relations between Portugal and Brazil, acknowledged the independence of the latter country.

In 1826 two events took place which gave rise to great discontent, the death of King John VI, and the war with Buenos Ayres. By the death of the king, Portugal devolved on the emperor of Brazil, and the Brazilians again apprehended that they might be placed in a state of dependence on that country. To remove such fears, Pedro declared his daughter Maria queen of Portugal, intending to marry her to his brother Miguel. The subject of the war with Buenos Ayres was the possession of the O branded; and, though not in the immediate interest of the nation, the spirit was about to be united to Brazil, and had been partly occupied by Brazilian troops. But the Republic of La Plata maintaining its claims to that country, the war was carried on with some activity and various fortune between 1826 and 1828. By the peace of 1828 the territory between the river La Plata and the Bahia Mission on the Paraná, both of which were to form independent republics, the former under the name of Uruguay Oriental, and the latter under that of Correntes.

But the internal peace of the country was not re-established. The Chamber of deputies had been formed on democratical principles, and they soon found other causes of discontent. Frequent disputes broke out between the emperor and the deputies, and several acts of violence occurred in Rio Janeiro. An affair, which took place on the 13th March, 1831, led to extraordinary results. The chamber of deputies had been prorogued, but twenty-four of the members then residing at Rio renounced with the emperor and returned to their respective provinces. The deputies then waited on the emperor, and demanded that he should accede to this demand, but his next choices fell on persons still more unpopular. This increased the dissatisfaction of the people, and the emperor was required to dismiss the new ministry also, which he refused to do. On the 6th of April a number of populace having assembled before the palace, the emperor ordered the military to disperse them; and on their refusal, he issued a proclamation, by which he abdicated the throne in favour of his son, and on the 7th left Brazil, after having appointed a guardian to his successor, who ascended the throne on the 11th of April.

The chamber of deputies now took a more decided lead in public affairs, and appointed a regency of three persons. It was expected, under the circumstances, that Brazil would soon be changed into a republic, but this event has not yet taken place. It would appear that the residence of the royal family in Brazil has attached a great number of the inhabitants to its interests, who strenuously oppose the attempts of the democratic party. It is remarkable, that among the numerous disturbances which have taken place since the organization of the country, the hatred which is directed to the destruction or complete overthrow of the democratic party. For the last few years Brazil has enjoyed more tranquility than the other states of South America. (Ayres de Cazal. Corografia Brasileira; Travels of Spalding and White, in Brazil, published by A. Wege's Geburtskunde Brasilie und Brasilien; Freyres, Beiträge zur kenntniss Brasilien; Schäffer's Brasilien; Weech's Brasilien gegenwärtiger Zustand; Travels of Mawo, Caldeleigh, and Graham; Southey's History of Brazil; and Smith's Map of Brazil.)

BRAZIL NUTS, the seeds of Bartholomew excelsa. BRAZIL WOOD. [CEA.SILPINA.]

BRAVE, an opening formed by the partial demolition of a rampart in order to permit an assault to be made upon the defenders of it. When the breach is effectuated it is effectuated either by directing upon the escarp, that is, the exterior surface of the wall, a fire of artillery, or by exploding a quantity of gunpowder which may be deposited in a mine formed for the purpose within the mass of the rampart. When the breach is thus formed, the rule and the breach is to be made by artillery, a battery consisting of guns of the greatest calibre is formed on the crest of the glacis; the muzzle of these are depressed so as to permit the firing to be directed against points in a horizontal line, just above the edge of the breach. The gun is placed at the salient angle, the battery should encompass the angle so that the guns may be fired at the same time against the two faces of the work. When by successive volleys the shots have pierced quite through the wall, the guns are directed as to fire at different points in a vertical line passing through each extremity of the horizontal groove, and thus a portion of the wall is detached from the rest; afterwards, a few shots being fired with diminished charges of powder, the detached pieces fall into the breach, leaving an opening, upon which, after the surface of the breach has been rendered passable by firing against it till the large masses of the demolished wall are sufficiently reduced, the troops may mount to make the assault.

As it is not always convenient to defer the formation of the breach till after the glacis has been crowned, the breaching batteries are sometimes constructed at an earlier period of the siege, and at a greater distance from the works. It is evident, however, that the firing cannot then be made with such precision, and unless the ground is level, or the ditchings are very shallow, the guns be directed to the foot of the escarp wall; consequently the breach will be steeper and more difficult of ascent. In old fortresses however the revetment walls often rise so high as to prevent the batteries from being brought within a much smaller angle of depression; in these circumstances breaches have sometimes been effectuated by firing from batteries at the distance of 1200 yards from the walls. Ramparts have also been breached from great distances by
Sir H. Davy states that wheat sown in autumn contains 77 per cent. of starch, and 19 of gluten; while that sown in spring yielded 70 of starch, and 24 of gluten: the wheats of the south and St. Helens contain more gluten than that of the north, and hence its peculiar fitness for making vermicelli. According to the chemist just quoted, oats yielded 59 of starch, 6 of gluten, and 2 of saccharine matter; while the same quantity of rye gave only 61 of starch, 11 of gluten, and 2 of saccharine matter.

The separation of the gluten from the greater part of the starch is very readily effected. Make flour into a thick paste, and work it between the fingers while a slender stream of water is running upon it, and continue the operation till the water ceases to be milky; then there remains a grey, adhesive, elastic mass, which is principally gluten, but contains some albumen and a little starch: to render it more pure, it is to be treated with boiling alcohol, until the filtered spirit ceases to become turbid on cooling. The alcohol dissolves the gluten, as well as a certain proportion of starches, the nature of which is imperfectly known, while the vegetable albumen is left. To the alcoholic solution of the gluten add water, and distil the mixture; the alcohol comes over, and there remains a fluid in which the gluten floats in coherent bulky flocks; a small quantity however remains dissolved combined with gum.

The gluten thus procured is of a pale yellow colour, and its smell is peculiar, but tasteless; it is elastic and adhesive; water does not dissolve it, but it is taken up by alcohol with difficulty. It is afterwards treated with diluted, of a deeper yellow colour, and eventually dries into a deep yellow mass, which is translucent, and has the appearance of dried animal matter. When moist gluten is exposed to the air it putrefies, emitting a very disagreeable smell, which becomes progressively stronger as the charcoal is left. It is composed of carbon, oxygen, hydrogen, and azote, in proportions which have not been determined: it is owing to the presence of azote that it yields ammonia, and in this respect it resembles animal matter.

These, which are the principal properties of gluten, are sufficient for our present purpose; a more detailed account of them may be seen in Berzelius, Tracté de Chimie, vol. v. In order to procure the starch of the flour, the water which has been used to wash it in obtaining the gluten is to be suffered to remain quiet; rest all the gluten which is merely suspended, may be separated on a filter and afterwards dried.

It is not requisite to give a minute account of the properties of starch; it is sufficient to state that it is colourless, transparent, and in a state of suspension when contained in glass, its particles have a crystalline appearance. It is insoluble in cold water, and coagulated by it when boiling; but between about 160° and 180° of Fahr., it is taken up by an alcohol, and a clear, colourless solution is formed, which does not deposit on cooling. It is not affected by any change even by long exposure to air; but when moist it becomes slowly sour. The peculiar and distinctive property of starch is its giving an intense blue colour, when treated with a solution of iodine in alcohol.

The difference between common biscuit and loaf bread has already been noticed, and we shall now state the means by which fermentation is induced, so as to give the bread the porous texture and lightness which are the proofs of its perfection.

When flour is made into a paste with water, the mixture is called dough, and when this is suffered to remain in a moderately warm place it undergoes that partial and spontaneous decomposition which is called fermentation, and which, in order to distinguish it from other kinds, has been called, but without sufficient reason for the distinction, the panary fermentation. During this fermentation a portion of the carbon and oxygen of the partially-decomposed flour recombine so as to form what is sometimes called fixed air, but correctly carbonate acid gas. this, during its passage through the natural terestial air, escapes into the air, and is conveyed to the other substances in smaller proportion: according to Vogel, it is composed of

In order to comprehend what takes place in this case, it will be requisite to state the nature of the different substances which constitute wheat flour; it is composed chiefly of starch and gluten, and some others, all of which diffuse themselves into the mixture of flour and water. In order to acquire the proper effects, the various substances are reduced to certain proportions: according to Vogel, it is composed of starch 68, gluten 24, gummy sugar 5, and vegetable albumen 1·5. The product of fermentation would however not only require much time, but dough thus spontaneously fermented is never quite free from putrescence and acidity, both of which
are injurious to the flavour of the bread: to remedy these inconveniences the process was formerly accelerated by adding to a mass of recent dough, a small quantity of old dough, in a state of strong fermentation; this was called leaven, and the mass to which it was added was said to be leavened.

Although the use of leaven was an unquestionable improvement, a still further one was made by the employment of yeast instead of it; by this the fermentation is much more rapid and perfectly effected. The exact nature of this ferment has not been ascertained; it is the frothy scum which rises on the surface of beer during its fermentation; it is a very compounded substance, and it is by no means determined to what portions of it the fermentive power is particularly owing. It appears to contain gluten, but this alone is not sufficient to account for the effects produced, as it is incapable of fermentation per se.

The following statement of the mode in which the baker's operations are conducted is taken from Dr. Colquhoun's essay On the Art of Baking Bread, in the 28th vol. of the Annals of Philosophy.

When the baker proceeds to the preparation of dough by means of the yeast fermentation, he at first takes, generally a portion only, but sometimes the whole of the water which it is his intention to employ in making the required quantity of dough. In this water, which varies in temperature, according to circumstances, from 90° to 100°, there is dissolved a certain portion of salt, the quantity of which however is always less than that which will finally be regularly containing in the finished bread. Yeast is one of the principal ingredients of the bread: yeast is now mixed with the water, and then a portion of flour is added, which is always less than the quantity to be ultimately employed in forming the finished dough. The mixture is now covered over and set apart in a warm place, exposed to the influence of the air after which signs of commencing decomposition make their appearance. The substance thus placed apart is termed, in the language of the bakehouse, the sponge; its formation and abandonment to spontaneous decomposition is termed setting the sponge; and the process by which the amount of water in the sponge bears to the whole quantity to be used in the dough, it is called quarter, half, or whole sponge. The sponge begins to swell out and heave up, evidently in consequence of the generation of some internal elastic fluid, which in this instance is always carbonic acid gas. If the sponge be of a semi-liquid consistence, large air-bubbles soon force its way to its surface, where they break and dissipate in rapid succession. But when the sponge possesses the consistence of thin dough, it confines this gaseous sub stance to the inner small cavities and enables it perfectly to nearly double its original volume, when no longer capable of containing the pent-up air, it bursts and subsides. This process of rising and falling alternately might be actually carried on and frequently repeated during twenty-four hours. The sponge has now acquired the power of counteracting all scope to the energy of the fermentative principle. He generally interferes after the first, or at farthest after the second or third dropping of the sponge; and were he to omit this the bread formed from his dough would invariably prove sour and tasteless to the eaters.

He therefore at this period adds to the sponge the remaining proportions of flour and water and salt, which may be necessary to form the dough of the required consistence and size, and next incorporates all these materials with the sponge by the process of kneading. When the kneading process has been continued until the fermenting and the newly-added flour have been intimately blended together, and until the glutinous particles of the flour are wrou ght to such a union and consistence that the dough, now tough and elastic, will receive the smart pressure of the hand without adhering to it when withdrawn, the kneading is for awhile suspended. The dough is abandoned to itself for a few hours, during which time it continues in a state of active fermentation now diffused through its whole extent. After this the bread is taken out of the oven and after a less laborious kneading, the object of which is to distribute the gas engendered within it as equally as possible throughout its entire constitution, so that no part of the dough may form a sod or ill-risen bread, from the deficiency of this case. After the second kneading the dough is weighed out into the portions requisite to form the kinds of bread desired; these portions of dough are shaped into loaves, and once more set aside for an hour or two in a warm situation. The continuance of fermentation soon generates a sufficient quantity of fresh carbonic acid gas within them to expand and increase their mass forming a loaf whose crust even is considered fit for the fire, and are finally baked into loaves, which, when they quit the oven have attained a size nearly twice as bulky as that at which they entered it. It should be remarked, that the generation of the due quantity of elastic fluid within the dough has been found absolutely necessary to be complete before placing it in the oven, because as soon as the dough is there introduced, the process of fermentation is checked, and it is only the previously contained air, which, expanded by heat throughout the parts of the entwined tough loaf, swells out its whole volume, and gives it the piled and vesicular structure. When it is recollected that the gas thus generally expanded has been previously distributed by the baker throughout the bread, and that the whole dough has been by kneading formed of a tough consistence, the result becomes apparent, that the well-baked loaf is composed of an infinite number of cellsules, each of which is filled with carbonic acid gas, and seems lined with or composed of a glutinous membrane, and it is this which communicates the light elastic porous texture to the bread.

It has been already observed that what is sometimes called the porus fermentation is not of a peculiar kind: it is the mere vinous fermentation; and it has been shown by Dr. Colquhoun, that during the fermentation of bread by the process of leaven, the fermentation of the grape alcohol is one of the most dangerous of all that take place in the bread; yeasts has also been most satisfactorily proved by Mr. Graham. (Ann. Philosophy, vol. 28, p. 367.)

To avoid the use of yeast, which might introduce alcohol, Mr. Graham kneaded a small quantity of flour, and it was permitted to remain in a state of fermentation for some days. By means of the leaven a considerable quantity of flour was fermented, and when the fermentation had arrived at its proper point, formed into a loaf. The loaf was carefully enclosed in a distillatory apparatus, and subjected for a considerable time to a moderate temperature. Upon examining the condensate liquid, the taste and smell of alcohol were quite perceptible, and by repeatedly rectifying it a small quantity of alcohol was obtained of strength sufficient to burn and ignite gunpowder by its combustion. Alcohol of this strength was obtained in quantity varying in weight from 0:3 to 1 per cent. of the flour employed: when the fermented flour was allowed to sour before baking, the amount of alcohol rapidly diminished, and the disagreeable empyreuma consequent upon this completely disguised the quantity of the alcohol when in its first distilled state and in vapour.

We have now stated sufficient facts to prove that the fermentation which occurs in the preparation of bread is merely the vinous, and Dr. Colquhoun has shown that it proceeds upon the same principles of the process of making wine, against allowing full scope to the energy of the fermentative principle. He generally interferes after the first, or at farthest after the second or third dropping of the sponge; and were he to omit this the bread formed from his dough would invariably prove sour and tasteless to the eaters. He therefore at this period adds to the sponge the remaining proportions of flour and water on salt, which may be necessary to form the dough of the required consistence and size, and next incorporates all these materials with the sponge by the process of kneading. When the kneading process has been continued until the fermenting and the newly-added flour have been intimately blended together, and until the glutinous particles of the flour are wrought to such a union and consistence that the dough, now tough and elastic, will receive the smart pressure of the hand without adhering to it when withdrawn, the kneading is for awhile suspended. The dough is abandoned to itself for a few hours, during which time it continues in a state of active fermentation now diffused through its whole extent. After this the bread is taken out of the oven and after a less laborious kneading, the object of which is to distribute the gas engendered within it as equally as possible through-out its entire constitution, so that no part of the dough may form a sod or ill-risen bread, from the deficiency of this case. After the second kneading the dough is weighed out into the portions requisite to form the kinds of bread desired;
about four pounds. There are however several circumstances which influence the quantity of bread obtained from a given weight of flour, such as the season in which the wheat was ground, the way the flour is, the older, within certain limits, the larger is the quantity of the bread produced.

If it were requisite, a long list might be produced of articles which have been proved or have been said to be mixed with bread. No advertiser could, we believe, arise from such statement. The most innocent of them is potatoes.

BREAD-FRUIT. [Antocarpus.]

BREADALANE. [Perthshire.]

BREAKWATER. [Plymouth.]

BREAM, a fish well known to anglers, and by them often called the carp-bream, from its resemblance to the carp, in being of a golden-yellow colour.

As there is another closely-allied species of bream, it would be well if the latter name were universally adopted. The Spanish bream, sea-bream, &c. belong to quite a different class of fishes [Pagellus, Canthus, and Brama].

The carp-bream and the white bream are included in the genus Abramis, and belong to the Cyprinidae, a family of the abdominal Malacopterygi. The chief distinguishing characters of the genus Abramis consist in the deep and compressed form of the body, the want of barbules to the mouth, the short dorsal fins, which are placed behind the ventrals, and the long anal fin. Abramis brama (the carp-bream) is taken in great numbers in the lakes and slow-running rivers of most parts of Europe, and is very prolific. It may be distinguished from allied fresh-water fish by its yellow colour and the deep compressed form of its body; its pectoral and ventral fins are tinged with red. The weight of this fish is considerable, and two breams have been caught weighing from eight to twelve pounds. Brama blicca (the white bream, or bream flat), the only other species known, has lately been discovered in the river Cam in Cambridgeshire and other rivers of this country. It is a smaller fish than the one just described (solden if ever exceeding one pound in weight), and is of a sliver or bluish-white hue. Its scales are larger in proportion, and likewise its eyes; the number of rays of some of the fins also differs from those of the carp-bream. For more detailed accounts of these fishes see 'Observations on the British Fishes.'

BREAST-PLATE. [Armour.]

BREAST-WORK is a mass of earth raised above the natural ground for the purpose of protecting troops against the fire of an enemy, its height being only such as will permit the enroppers to throw stones, fire over a baquette or step. When the work has its surfaces carefully formed and revetted or covered with sods, particularly when it is elevated on the rampart of a fortress, or constitutes a considerable field fort, it is always denominated a parapet—those of the English chiefly composed of a solid mass of earth thrown up to cover the troops stationed on any exposed part of a field of battle, or doing duty as an outpost of the army; or to the gabionnaud, that is, the row of gabions placed on end and filled with earth, which the sappers construct for the protection of the troops in the trenches, or on the breach which is made in a rampart. A breast-work however differs from an eapament, which is also a mass of earth or other material raised to cover troops or artillery when in situations exposed to the fire of the enemy, in that it is intended to be placed above ground level.

The understandings with which the Greeks and Romans protected the ground occupied by their armies were breast-works, which in wooded countries frequently consisted merely of felled trees; and in other circumstances were formed of earth protected by palisades, or by the interwoven branches of trees planted on the top of the bank of earth. The same denomination might be applied to the continuous lines which were formerly raised for the protection of armies; but as these are now understood as engineering expedients, instead of the number of separate redoubts are usually formed at intervals from each other to contain artillery, the word breast-work is little used, the protecting masses of earth generally receiving the name which is given to those which crown the ramparts of a permanent fortification.

BREATHING. [Respiration.]

BREATHING-PORES, microscopic apertures in the cuticle of plants, through which the functions of respiration and evaporation are supposed to be carried on. They are formed by the juxtaposition of two cells which do not subside when they touch, but which have a power of contraction so as to leave an opening between them which acts as an escape-valve to the air-chambers immediately beneath the pores [Brady].

Breachword, literally signifying "an opening or breaking in any substance," is employed in geology to designate a rock composed of angular fragments of a pre-existing rock, or of several pre-existing rocks, united by a cement of mineral matter that may vary from compact to friable. Thus, as in the annexed diagram, the fragments (which are shaded) may be composed either of angular portions of quartz rock, or any other single rock, united by a cement (which is dotted) formed of the hard silicious substance named chert, or any other hard mineral substance; or the fragments may be angular portions of many rocks, such as a mixture of pieces of slate, porphyries, limestones, granites, or others, united by a friable sandstone or any other soft mineral substance.

The name of Breccia is derived from the well-known Breccia marble, which has the appearance of being composed of fragments joined together by carbonate of lime, infiltrated among such fragments after the latter were produced by some disrupting force.

Breachwood informs the geologist that the pre-existing portions of rocks, included in them, have not been exposed to considerable friction, which would have rounded off the angular parts, as has happened in the case of pre-existing pieces of rocks included in conglomerates [Conglomerate]. Hence the geologist may expect to find the rocks, whereas the angular fragments of a breccia are derived, not far distant from the breccia itself, while the rounded pebbles contained in a conglomerate may have been transplanted from considerable distances.

Breachwood, a par. and royal burg in Forfarshire, Scotl., bound on the E. by the par. of Dun, W. by Carsiaton, N. by Strickathrow and Menmuir, S. by Faraul, and S.W. by Aberlemno; and situated on the N. bank of the South Esk, 72 m. W. of its junction with the sea at Monroeside; and on the F. of Forfar, 5 m. S.W. of Aberdeen, its par. is about 7 m. from E. to W. and 6 broad from N. to S.; and contains 224 square miles.

Breachwood was formerly a walled town and a bishop's see. The bishopric was formed about 1160 by David I. In 1669 B. was made a county borough, and possessed uniting of 16 doz. and 10 geo.; 18, corn for horses, 1 chald and 2 bolls; salmon, 3 barrels; money by kinds, 2417. 6s. 8d. (Scotch); teind wheat, 41 bolls; bear, 14 chalders, 6 bolls; meat, 26 chalders, 5 bolls. They are in the upper part of the town, and are the ancient chapel of Maison Dieu, which is now used as a stable. In the churchyard near the cathedral there is one of those curious round towers which have puzzled antiquarians to settle by whom they were built and for what purpose they were constructed. Several exist in Ireland; one only other exists in this island. This tower is about 106 ft. high, and is constructed of stone: the workmanship is admirable. It is surmounted with a conical roof of gray slate; and there is no appearance of there having been any staircase within it. There is a full description of it in the 'Account of Fife,' 1796. The measurements there are correct given; but the statement as to the spiral courses of masonry is incorrect. The cathedral, the W. end of which is now the par. church, was built by David I. in the eleventh century. Brechin Castle stands on the top of a precipice, and is separated from the town on the E. and W. by a deep ravine; its S. base is washed by the South Esk, which here forms a fine sheet of water. In this castle Sir Thomas Maule defied the forces of Edward III. until he was killed by a stone thrown by an engine, when the garrison surrendered to the English.

The town-house, near the cross or market-place in the middle of the town, was almost entirely rebuilt about thirty years ago: it contains a court-room and prison, two rooms for the meetings of council, and a guild-hall. Three schoolrooms, built in 1840, are described above. The W. end of the town. Towards the N. end there is a Scotch Episcopalian chapel, built about twenty years ago, and enlarged and beautified in 1833, especially at the W. end, which is nearly finished with two nunaria in each side of
THE cross in the centre. There are four plain and commodious Presbyterian meeting-houses; one of which was until lately used as an English Episcopal chapel, one belonging now to the Antiburger, one to the Relief, and two to the Secession. The building of the last was in 1832. In 1831 a new church, or chapel of ease to the establishment, is now (1836) building.

In 1831 the number of houses in the burgh and parish was—Inhabited 900, building 9, and uninhabited 32; the total number of families was 1675, of whom there were engaged in agriculture, 961; in trade, manufactures, and handicraft, 1630; other families, 317; the total number of persons was 6508; males, 3048; females, 3460.

At Brechin upwards of 400 persons are employed in the linen trade. The number of fatuous persons is 34; blind, 19; and deaf and dumb, 3. About 900 families attend the Established, and 500 the Dissenting and Episcopal churches. The real rent of the parish is about 13,064
eight, the average rent of land is about 27s., and land as grass for the season from 20s. to 35s. per imperial acre. There are about 30 men and women employed in hecking, 260 in spinning, from 1000 to 1500 in weaving, and from 40 to 50 in bleaching. Two spirit distilleries are carried on near the town.

There are three tramways and several freestone quarries, besides three nurseries, consisting of about 25 imperial acres, which supply a large district with ornamental shrubs, bushes, fruit, and forest trees.

The burgh is governed by the town council, which since 1829 has consisted of thirteen members, chosen by the 10l. householders within the burgh. One of the eleven is elected by the ratepayers in the parish. The council choose the magistrates, a provost, two bailies, a treasurer, and a master of the hospital. The property, except the town-house and school-house of Brechin, in 1832, was valued at 13,935£; it consists of lands, houses, mills, growing wood, and meadow; the church has 900 acres, and a church and shares in a turnpike road.

The town-house and school-house may be worth about 300£. The total annual revenue of the burgh is 721£ 3s. 34d. The ordinary expenditure in 1832 was 700£ 4s. 114d.; the extraordinary in improving streets and roads, about 50£, and the repayment of the mortgage of that year, 354£ 6s. 63d. At the same time the town's debts were 3284£ 10s. 04d.

Within the last forty years the value of the property is nearly doubled, the income and outlay are nearly doubled, and the debt has increased fivefold. The magistrates exercise their jurisdiction within the royalty boundaries, which are not so wide as the parliamentary. A bailie court is held every Wednesday, except two short vacations, in which there have been brought, from 1820 to 1834, 639 Civil Causes (proper). 436 Removals. 24 Building Warrants, since 1837. 46 Criminal Causes.

1163

The town-clerk acts as assessor in the bailie court. There is an appeal from the bailie court, where only one magistrate sits, to the other magistrates. The magistrates and council elect the civil officers of the burgh. The six incorporated trades, except the jewellers, possess the exclusive privilege of carrying on their trades in the burgh. Brechin, in conjunction with Montrose, Arbroath, Forfar, and Inverbervie, returns one member to parliament: the number of constituents amounts to for Brechin, 233; for the district, in 1833, to 242.

The church in the centre of the town is in excellent repair, and contains 1500 sittings. The charge is collegiate. The first minister has a house built from the funds of the Exchequer more than fifty years ago, and about an acre of garden ground. His stipend is 19 chalders of grain, 34 loads of coal, and the rest half barley and half oatmeal, besides 10l. for communion elements. The second minister has a house, a glebe of 6 acres of good ground, 17 chalders of grain, 21l. from bishops' rents, and 10l. for communion elements. We have already mentioned the stipend of each is about from 220l. to 300l. a-year.

In 1834-35 the arrangement of the schools was rescinded. The rector of the grammar school and preceptor of Maiton Dietz has a fixed salary of 60l. per annum; 10l. per annum for a house, and 20l. as a premium for some excellent work or some fees from scholars. The parochial teacher has a salary of 40l. and the third teacher of 25l. per annum, besides fees. In 1826 the rate of par. school fees was, per quarter, reading 2s. 6d.; writing, 2s.; reading and writing, 3s. 6d.; arithmetic, 4s. 6d.; French, 8s.; Latin, 6s.; and geography, in addition to any of these branches, 1s. The average number of pupils was 112. Greek and mathematics were occasionally taught. In 1825 a minute was taken to oppose the building of any new church, or chapel of ease to the establishment, is now (1836) building.

The average number of pupils was 112. Greek and mathematics were occasionally taught. In 1825 a minute was taken to oppose the building of any new church, or chapel of ease to the establishment, is now (1836) building.

(Answers to Queries on Sheriffdoms on Parishional Education in Scotland; Enumeration Abstract of Population Returns, 1831; Boundary Reports; New Statistical Account of Scotland; Playfair's Description of Scotland; Chambers's Gazetteer; Scotch Municipal Corporation Reports.)

BRECKNOCK or BRECON, the capital town of Brecknockshire, called by the Welsh Aber Honndu, the mouth of the Honndu, in lat. 51° 54' N., long. 3° 12' W., 167 m. W.N.W. of London, near the centre of the co., in an open valley at the confluence of the riv. Usk and Honndu. It is a corporate town, and returns one member to parliament. The limits of the bor., which are not set out in any existing charter, seem to be well ascertained; they are extremely irregular, reaching in a W.S.W. direction about 2 m. from the castle; towards the W. of the same building, their extent does not exceed a quarter of a mile. Part of the par. of Llyw, called Treecastle Ward, on the left bank of the Usk, on the high road from Brecknock to Caermarthen, belongs to the bor. of Brecon, and is subject to the jurisdiction of the corporation. Exceeding Treecastle Ward, the whole bor. of Brecon extends to the Usk, the river forming the bor. of Llanfaes. Each of these par. is divided into an upper and lower division. Of St. David's, the lower division is wholly within the bor., and the upper wholly without it; and of St. John's, a great part of the upper division of the par. is without the bor. wall. The chapel of St. Mary's, called the chapel of St. Mary's, is within its limits. Two portions of the space comprised within the bor. line, the castle and Christ's College, are extra-parochial. Under the Boundary Act, they form a part of the parliamentary, but are not included in the assessment for the trial of small debts and actions. The expense of trial in these courts is sometimes less than forty shillings, if the action is undefended; and from four to five pounds, if it is defended. It takes about three weeks to obtain judgment. There is a small bor. gaol maintained by a bor. rate, which is used for debtors only, an arrangement having been made with the co. to send other prisoners to the co. gaol, which is also in Brecknock. The income of the corporation, in 1835, was under 256£.

The castle and court were built by Barnard Newmarch, a relative of William the Conqueror, who wrested the co. from the hands of the Welsh princes, and here fortified himself, that he might the better maintain the rights which had been granted to him as Lord of Brecon, against the annual attacks of the Britons. When the Britons were considerably increased and improved by the last Humphrey de Bohun, Earl of Hereford, high constable of England and governor of Brecknock. Part of several towers, including that called Ely Tower, in which Morton was confounded [BRECKNOCKSHIRE], are still standing. The situation is commanding for the purposes of early warfare: the main part of the fortifications may still be traced. It appears from a manuscript in the British Museum that the Castle of Brecknock and the walls of the town were destroyed by the inquisition of the inl. and Edwards; and that a garrison and the miseries of a siege. Two priories, the one Benedictine and the other Dominican, were also founded by Barnard Newmarch, in the reign of Henry I. The first is now the par. church of St. John's, called the Priory Church; the second was converted into a college by Henry VIII. The Priory Church stands in the N. part of the town, adjoining the precinct of the priory, where there is a beautiful panoramic by the side of the riv. Honndu. The architecture of the church is not so antient as the institution itself. It was built, perhaps, in some ways, and is built in the form of a cross, from the centre of which rises an embattled tower. A paddle cloister extends from the church to the refectory. This is the principal church in Brecknock; it is frequented by the inl. of the upper portion of the par., and of St. John's; the chapel of St. Mary's, the building of no remarkable beauty or antiquity, is the established place of worship for the lower division. The Dominican convent, now the college, is situated near Llanfaes.
church, on the W. side of the Usk. This establishment is
now of little use: it formerly was a place of education for
the Welsh clergy, but has ceased to be so since the foun-
dation of Bishop's College, which is a rival in influence.
Part of the college buildings have been converted into a grammar school and dwelling house.

The school is attended by less than ten children, and the building is very much out of repair. Service is performed to a small
congregation in the chapel on Sunday evenings. The en-
doors, which are under the authority of the bishop, are
in good order. The pastor, Rev. W. G. David's is an early English building, of no particular beauty,
situated near the Treacle road, on the W. side of the Usk.

The town is built in a healthy and extremely picturesque situation: it contains no very remarkable buildings. There
was formerly a wall formed with ten turrets, and through
which there were five gates, called the Castle Gate, Street
Gate, Watton Gate, Water Gate, and Bridge Gate: these
do not now exist. The principal streets are the Bulwark,
the Street, High Street, Watton, and Wheat Street. There
are three bridges over the Houndu, and one over the Usk.
The town-hall stands near the centre of the town: the
building is old and inadequate for its purposes; and a
bill is now before parliament for the erection of a new one. The
barracks are situated in the Watton, the entrance from
Crickhowell. Detachments of infantry and artillery are
quartered here, to be at hand in case of any disturbances
among the colliers and iron-works. Nearly adjoining the
barracks an infirmary has been lately built, which is reliev-
ing fifty in and out-patients. There are three banks in
Brecon, according to a joint company, and another to others to private individuals. The town has a tendency to
increase at the principal outlets; houses are now building in
those which lead to Hay and to Crickhowell. Fairs are
held five times in the year,—in March, May, July, Septem-
ber, and December at the fair-ground in Market-day on
Saturday; these are well supplied with corn, cattle, eggs,
and poultry, of which an abundance is reaped by the neigh-
bouring farmers and cottagers. The town is lighted with
gas, and is well supplied with coal, brought along the can-
at a very moderate price. A small quantity of flannel and
coarse woollen cloths are manufactured in the town; hats
also are made here of a middling quality. The excursions of
the Breconshire Agricultural Society to establish a linen
factory have been wholly unsuccessful.

The pop. of Treacle, according to the last census, males, 2234; females, 2702; total, 5026.

The entire par. of Llanfae then contained 1321, and
the par. of St. John's 867 inh., including in each the portions
which are without the bor. The census states the bor. of
Brecon, according to the returns of 1831, consisted of 1149 families; 92 employed in agriculture; 609 in trade
and manufactures; 448 others. The commissioners of
corporation inquiry who were in Brecon in 1834, estimated the
number of 161 houses within the bor., at about 348; only
12 were assessed for taxes. The number of voters registered, in 1834, was 242.

The Lancasterian schools, both for boys and girls, are
well attended. The school of the Broughghard charity con-
tains about forty children: these, since the decline of the
College school, have been the principal places of education
in the town. There is no mechanics' institute or other
similar establishment. The poor's-rate does not appear to
have varied much in the last few years; it has not in-
creased, if any judgment can be formed from the accounts,
which have not been made up in a regular manner, of the
amount of the assessed taxes collected in the bor. of Brecon
in 1834, 1192l.; in 1835, 997l. (Communication
from Breconshire.)

'BRE', an inland co. of S. Wales, bounded on the N. by Cardiganshire and Radnorshire, from
which latter co. it is for the most part separated by the riv.
Clerainen, Eian, and Wye; on the W. by Cardiganshire and Caermarthenshire; on the S. by Glandorganshire and Monmouthshire; on the E. by Herefordshire.

This co. extends from N. to S. 35 m., and from E. to W. about 30 m. Its area is near 754 sq. m.
The pop., in 1831, amounted to 47,763: thus Breconshire ranks the third among the S. Welsh co. in extent of surface, and fifth in amount of population. At an antiently called Garth
Madin or the box-hold, and derives its present name from
Brychan, a Welsh prince, who lived in the fifth century.
The surface of this co. is extremely irregular, the valleys
and the mountains the highest in S. Wales. It is
interconnected on the N. and S. by two long ranges of moun-
tains: 4 that on the N. goes by the general name of Egypt,

an obsolete British word for a hill; the other range, begin-
ning with the Caermarthensha Beacos, runs nearly parallel to
the Usk, and is named after the stations of its various
outlets in Monmouthshire. Between these two chains a third
ranges abruptly near Talgarth, which is called the Black
Mountain. Another line also branches across in a direction
from N. to S., about eight m. below Brecknock, dividing
the tract of country into the above noted two. The principal
rivers are the Wye; the Usk, which rises in the Caermarthensha Fann, about five m. from Treacle; the Houndu, which rises in
Drum-dhu, and falls into the Usk at Brecknock; the
Yfon, which rises in Bryn-gawr, in the N.W. boundary of
the co., and falls into the Wye about a mile north of
the Eian, the Claerwen, and the Tawe. The Tarell also, a
small riv., rising in Bryn-du, joins the Usk a little above
Brecknock, and the Taf Fechan (small), and Taf Fawr
(large), which rise in different parts of the S. declivity
of the Brecon Beacos, unite into a considerable stream,
the Taf, at the S. boundary of the co. near Cyfarthfa Park.
None of these streams are navigable. To facilitate the
conveyance of goods from Brecknock to Newport, a can.,
capable of conveying boats of twenty-four tons, was finished
in 1827. The Usk and the Tawe, navigable down to Hay,
and from thence to Kington and the lime rocks near Old
Radar. The Swansea can. enters for a short distance
the S.W. part of the co. The mountains Mynydd Llan-
gynfa, Mynydd Fechan, and Mynydd Pen Cynr, near the Clydach, at the S.
boundary of the co., are the highest peaks in this part of the
co., and are connected with many railways, which communicate with the
various collieries and iron-works. Two branches descend into the vale of Usk, so as to connect with the Crickhowell can.;
the one near Tal-y-bont, the other near Llangattock. There
is also a long line of railroad, which begins near the north
milestone on the Breconock and Treacle road, and passing up
a valley of Forest Fawr to the E. of the riv. Tawe, and
nearly parallel to it, communicates with Dowl Colliery, and
finally with the Swansea can. About five m. E.S.E. of
Brecknock, there is a circular level Lagoon, 400 feet
above the level of the Severn, a sheet of water two m. long, and in some places one
branching. It abounds in fish, and in winter is much fre-
cquently fished by wild fowl. In 1235 permission was
granted to the monks of Breconock to fish in this lake three days in
the year. The glebe held by the vicar of Brecon is 23 a. 10ro.
one boat. The scenery in this co. is extremely beautiful.
The extensive views from the mountains, the abrupt outline of the Brecon Beacos, the undulating surface, frequently
clothed with woods and intersected by torrents, from which the excellence of the landscape assessments,
are very striking to the admirers of the picturesque.

The principal roads are from Treacle, through Breck-

ock to Crickhowell, which is travelled by the Caermarthensha and London mail, that from Brecon to Hay, on which a considerable improvement is contemplated within two miles
of the former place; also the roads from Brecon to Merthyr,
and from Builth to Hay. These as well as the less important thoroughfares through the co. have in late years been
greatly improved. A new line of communication of great
utility, the canal from Builth to Hay, seven miles in length,
built by Sir R. Livington, was in 1834, 3552.

The climate varies considerably, according to the elevation
and exposure. In the neighbourhood of the Brecon Beacos,
the Black Mountains, and the elevated districts between
Treacle and Blaenavon, the winds are light and the tem-

erature is very variable; in the lower situation, the win-
tinal rains, are often severely felt, by which the crops are
injured, and the harvests retarded; the lower valleys are comparatively warm. The country is subject to much rain, but
the air is, on the whole, bracing, and the pop. healthy: upon
an average, the deaths from 1821 to 1830 in the par. of Brecon,
deaths were 1 in 66.4.—a calculation which places Breconshire
among the most healthy co. of England and Wales.

The geology of this dist. has lately occupied the attention
of that able and industrious geologist, Mr. Murcshian, late
president of the Geological Society. The oldest rocks which occupy the W. of Brecknockshire consist of gneiss-wacke slates; a remarkable line of trap and porphyry breaks through the rocks of this age, extending from Llandinam for about four m. to the N.N.E. Between these old rocks and the escarpment of Mynydd Epynt and Mynydd Bwch y Groes are the remains of a ridge of conglomerate, consisting of that which Mr. Murchison has recently described as the Ludlow rock, which there passes up into the old red sandstone. These transition rocks, which in Shropshire and Radnorshire contain thick masses of lime, are throughout the whole of their range in Brecknock the remarkably void of limestone. The great mass of the co., especially the central and S.E. dist., consist of the old red sandstone, which has been shown by Mr. Murchison to be divisible into three sub-formations:—1. A lower zone of limestones, remarkable in this district for the remains of the corals of Mynydd Bwch y Groes, extending into Caermarthenshire. 2. A central portion of marls, concretionary limestones (locally called cornstones), sandstones, &c. 3. The upper portion of sandstone and conglomerate; this upper portion, occurring in very small layers in Brecon, consists of the lofty mountains, between Brecknock and Abergavenny, is by its inclination carried under the whole of the great productive S. Welsh coal-field. We thus see that the whole of the district to the N.W. of this tract of country lies beneath the coal measures.

The mineral springs at Builth and at Llandrindod are in the silicified and hardened schists, at points where they are penetrated by trap-rocks. Their origin is considered to be due to the decomposition of the vast quantities of sulphuret of iron; in such places without a stratum of the strata containing iron and coal, which, though for the most part in Monmouthshire [Monmouth], in some places cross the boundary of Brecknockshire, there are no mines or minerals in this county. Some small tracts of coal have been found in the old red sandstones, which upon trial have proved to be un-workable.

One of the most remarkable features in the geology of Brecknockshire is a penin. of transition rocks, which is thrown up from N.E. to S.W., ranging from a high bluff on the Wye, the rocky promontory of Cory’s Fan, five m. N. of Brecon.

The soil in the hund. of Talgarth and Crickhowell is more favourable to cultivation than any other part of this co., as results from the conditions of climate; there are orchards, from which good cider is frequently manufactured. In the hund. of Devynnock, and perhaps more so than in that of Builth, where there is much cold, wet clay, barley and oats are the grain crops chiefly cultivated by the tenants; but the farming of the co. has considerably improved during the last fifty years: partly through the exertions of an Agricultural Society, one of the earliest in the is., which was established in 1755, by Mr. Powell of Castle Madoc. Better implements are used, more manure penn. to the fallow land, and more skillful tillage is being practised. The farm animals are much more numerous and better cultivated, and the farming stock is of better quality. In the high lands are bred small black and brindled cattle, horses (which throughout the co. are of rather an inferior sort), ponies, and good hill sheep, the soil, though much worn, being not so changeable as that of Builth, is not so unsuitable to the manufacture of flannel. In the low lands the Herefordshire breed of cattle predominates, and is on the increase. The ewes are brought down from the hills in winter, and are not taken back until the colts are three months old. There are three farms at Cory’s Fan, consisting of 100 acres, one of 200 acres, and another of 400 acres, under the tenure of 100 years, and very few exceed 500. Among the few that are considerable are the united vicar of Crickhowell and Llan-der-felly, the income of which is about 188l., the ree. of Llangattock 1123l., and Llananwedl 460l. a year.

The manufactures of this dist. are few and unimportant. Flannel and other woolen goods, such as baize and coarse checks for trousers, are woven in several small factories. Some hats of middling quality are also made in the bor. of Brecon. The knitting of straw caps was formerly practised to a great extent by the women of the country, is now less frequent. Woven stockings, though less durable, are so much cheaper as to have greatly diminished this branch of industry.

The co. of Brecknock contained, in 1821, 9848 families, of which 3959 were employed in agriculture, and 2954 in handicraft, trade, and manufactures. The number of males above twenty years of age was then 12,220: about 80 of these are employed in weaving woolen yarn, the produce of which is marketed in the co.; and about 2500 are employed in the iron-works, of whom 126 are at Llanelli, 110 at Penderney, and 234 at Faenor, places near Merthyr Tydfil. The pop. of the co. is thus distributed:—

Total: 23,896

The number of occupiers of land is estimated at 24,294, of whom 12,494 are employers of labourers. It is remarkable that in the pop. returns of this as well as in some of the adjoining co. no one is enumerated as following the trade of a pawb a thyrn.

This co. is wholly in the diocese of St. David’s and prov. of Canterbury. In its 66 par. there are 23 recs., 16 vicis., and the remainders perpetual curacies. The assizes are held at Brecknock, by the judge attended the S. Welsh assize circuit. Brecknockshire returns one member to parliament. The number of co. constables increased in 1834 was 1646. Brecknock is the only polling place.

Brecknockshire remained in the power of the Welsh princes until 1092. It was in this year that Barnard Newchurch, a heriet, a, and, according to the Chronicle of Brecon, the brother of William the Conqueror, made himself master of Brecknock, where he established himself with a number of his retainers. The lordship of Brecknock was granted to him by the king, and that he might obtain possession of his rights and to better defend himself against the Danes, whose hostility and resistance to his authority made it difficult for him to maintain his position in the country, he built the castle of Brecknock, as a stronghold for himself and for his troops. Notwithstanding the vigorous efforts of the Normans, the insurrection of the Danes and the Welsh, William, whose hostility and resistance to his authority made it difficult for him to maintain his position in the country, he built the castle of Brecknock, as a stronghold for himself and for his troops. Notwithstanding the vigorous efforts of the Normans, the insurrection of the Danes and the Welsh, determined the Prince of Wales, and at his death the lordship of Brecknock was inherited by his son-in-law, Milo Fitz Walter, Earl of Hereford. This earl was succeeded by four of his sons, in turn, and, afterwards by Philip de Broes, their brother-in-law, who died about 1160 a.p. He was followed by his son William de Broes, to whom the lordship was confirmed by King John in 1194. This spendthrift defrauded his son, upon whom he had settled his inheritance, mortgaged it three times over, cheated his creditors, and at last sold it to the king, who, after obtaining possession, though all paid the purchase-money. He was for some time at enmity with King John, was attainted, and the lordships of Talgarth and Bladynffili were given to the king’s favourite Peter Fitzherbert. William was succeeded by Roger, and afterwards by Henry, who, on the accession of Henry III., had obtained the restoration of some escheated property to forsake his father-in-law and his adherents. Llewelyn, incensed at

No. 319. [THE PENNY Cyclopaedia.] VOL. VII.-3 C
this breach of faith, laid siege to Brecknock, which was however spared at the earnest interference of the burgesses. Reginald and Llewelyn were afterwards reconciled, upon which the king re-transferred some of the property of the former to Fitzherbert. Reginald died in 1228, and was buried in the Priory church at Brecknock. His inheritance passed to his brother William, but his eldest son by his first marriage, who died before his father, was disinherited, and his property restored to the family of the Herefords, in the person of John de Bohun. This earl, after having been created knight of the bath, died in 1335. Humphrey, his brother, succeeded him, and was excommunicated by Pisan, because he married the daughter of the last earl of Brecon; he died unmarried, and his nephew William inherited his titles and estates. William resided in the castle of Brecknock, and by his wealth, magnificence, and hospitality considerably raised the importance of the place. Elected lord of Hereford, his courtesy and magnificence were so great that once accompanied Edward III, to France, was employed by him in an embassy to the Duke of Bretagne, and finally died in 1377. The lordship of Brecon seems to have remained in settlement during the childhood of Joan his heir. While Warwick was in France, the last of the lords de Bohun, the last of whom made ample amends for the offences of some of his predecessors, who seem to have considered their Welsh territories of no further use than as a source of revenue and a nursery for men, who, through a system of systematic education, retired to Henry IV, who had married Mary, the daughter of the last De Bohun. During the first four years of this reign, Brecknockshire was greatly harassed by Owen Glendower. The castle of Brecknock was intrusted to the care of Sir Thomas Tew, who, for a bribe of 1000 marks, was promised by Warwick to order to defend the castle and the lordship, having 100 men at arms and 300 mounted archers assigned them for that purpose. Griffith, the eldest son of Owen Glendower, engaged the king's troops upon a hill in the hedges of Cwmhir, resisted the attack of 1500 men. Henry IV, granted to the inh. of Brecknock an exemption from tolls and other payments, renewed the benefactions to the monks, and gave them their first royal charter. Upon the death of Joan, courtier, dowager of Hereford, the king granted her estates to Anne, the widow of Edmund, Earl of Stafford, slain in the battle of Shrewsbury, who claimed a division of her grandmother's property. No sooner was she possessed of Brecknock than she disposed of the baron and took all their grants, charters, privileges, and possessions which were during her life, which terminated in 1439. Her son Henry, Earl and afterwards Duke of Buckingham, succeeded to her inheritance. He was a severe, arbitrary man, who, though he obtained the support of the king, was an oppressive governor and landlord. He was also Lord Lancaster, was wounded at St. Albans, and slain in 1450 at the battle of Northampton. His grandson, a minor, succeeded to his honours, and to Sir William Herbert during his minority. In 1551, during the English Wars with France, the lordship of the Earl of Brecknock, as well as the stewardship of all the other Welsh castles which had belonged to the late Duke of Buckingham. Upon coming of age Buckingham obtained possession of his estates, and lived in retirement within the walls of Brecknock Castle, which he had purchased from the Earl of Edward IV. At the death of this king however he left his seclusion, and became a conspicuous supporter of the Duke of Gloucester, until he was seated on the throne. In reward for these services, Richard made him governor of all his castles in Wales, and lord high constable of England, with other lucrative and honourable offices; he also promised to restore to him all the lands forfeited by the Bohuns, which would have made him the richest and most powerful nobleman in England. These promises never were fulfilled. Richard was succeeded by Henry VII, who, after making John of Gaunt his successor, made him a Lancastrian; he was now king; his object was gained; he evaded his engagements, and treated his former friend with neglect and contempt. The duke, incensed at this ingratitude, turned his thoughts to vengeance, and now became as eager to dethrone the Duke of Buckingham for Henry VIII had been anxious to extirpate him. He retired to Brecknock, where Morton, the able and artful Bishop of Ely, was a prisoner; and in Ely tower in the castle was first projected a marriage between the Duke of Richmond and Elizabeth, daughter of Edward IV, and the union of the houses of York and Lancaster. Morton crossed the sea to confer with Richmond, who was on the continent, and to plan with him a descent upon England; while Buckingham endeavoured to raise an insurrection at home. Richard was too vigilant to permit this honourable expedition, and issued an order, commanding the immediate attendance of the Duke of Buckingham, who disobeyed this peremptory sum-
mons, and took arms with his followers; but being detained by floods, betrayed by his friends, and deserted by his troops, was taken, and ultimately executed at Salisbury without a trial. Morton escaped into Flanders. The Duke of Richmond, who afterwards landed at Milford, in his road to Shrewsbury, washed through Brecknockshire, where he greatly increased the number of his followers. As soon as he was established upon the throne, he restored to Edward, the son of the last Duke of Buckingham, the estates and titles of his father, and in 1564 made him high constable of England, the last person that ever held that office. He was afterwards accused of treason, and executed in 1561. The dukedom of Buckingham was now extinct, and the lordship of Brecknock with its dependencies merged in the crown of England.

Brecon was the chief city of Brecknockshire. It is situated on the river Usk, about 20 miles from Newport and 30 miles from the sea. It is a market town, and has a fine market-place. It is the seat of a Bishopric, and has a cathedral. The town is pleasantly situated, with a fine aspect, and is surrounded by beautiful scenery. It is the seat of a grammar school, and has a good library. The town is well supplied with water, and has a good system of drainage. It is also well supplied with gas and electricity. The town is well connected with the railway, and has a good system of roads.

The castle, already mentioned, was rebuilt in 1680 by William, Prince of Orange, afterwards William III. of England. It contains a fine gallery supported by marble columns, and a very handsome staircase of stone.

Breda was once a place of considerable trade, and contained extensive manufactures of cloth; this branch of industry is still carried on to a large extent. The town likewise contains several tanneries and breweries, from which the surrounding country is supplied.

The pop. on the 1st of January, 1830, consisted of 6747 males and 5637 females, and 4703 families. The accompanying table shows the present state of education.

Lending libraries are attached to only three of these schools. No infant schools have yet been established.

The amount of money expended for the relief of the poor was, for the years ending 23rd March, 1826, 1826, 18434; 1827, 17,019; 1828, 16,712; 1829, 16,264. (Communication from Mr. Breda.)

BREDA, once a lordship belonging to the House of Orange, and a town in N. Brabant situated at the confluence of the Meuse and the Scheldt, in 51° 35' N. lat., and 4° 47' E. long.

Breda is a well-built and strongly fortified town, surrounded by marbles, which, in case of attack, can be laid under water. The castle, which is the principal building in the town, is surrounded by the riv. Merk. It was originally built by the family of Schoten, who held it with the title of Baron, in 1190. It is the seat of the Duke of Brabant; and in the beginning of the 13th century passed by marriage to the house of Nassau. In 1567 it was annexed by the Duke of Alba to the crown of Spain. In 1577 the Spanish garrison opened the gates to the conquerors. Four years after, the town was treasonably delivered to the Duke of Parma; but it was retaken in March, 1590, by Prince Maurice of Nassau, by means of the following stratagem:—A vessel was loaded, apparently with turf, of which the besieged garrison was greatly in want, but under the cover of a party of soldiers were concealed. Admission into the town being thus secured, the soldiers left their place of concealment during the night, and having overpowered the guard, opened the gates to Prince Maurice, who had advanced with his army. In 1624 Breda yielded to the troops of General Spinola, who commanded the troops of the Infanta Isabella. In 1637 the town again came into the possession of the States General of the United Provinces, and was confirmed to them by the treaty of Westphalia. The French, under Dumourier, took Breda in 1695.

Lending libraries are attached to only three of these schools. No infant schools have yet been established.

The amount of money expended for the relief of the poor was, for the years ending 23rd March, 1826, 1826, 18434; 1827, 17,019; 1828, 16,712; 1829, 16,264. (Communication from Mr. Breda.)

BREDA, once a lordship belonging to the House of Orange, and a town in N. Brabant situated at the confluence of the Meuse and the Scheldt, in 51° 35' N. lat., and 4° 47' E. long.

Breda is a well-built and strongly fortified town, surrounded by marbles, which, in case of attack, can be laid under water. The castle, which is the principal building in the town, is surrounded by the riv. Merk. It was originally built by the family of Schoten, who held it with the title of Baron, in 1190. It is the seat of the Duke of Brabant; and in the beginning of the 13th century passed by marriage to the house of Nassau. In 1567 it was annexed by the Duke of Alba to the crown of Spain. In 1577 the Spanish garrison opened the gates to the conquerors. Four years after, the town was treasonably delivered to the Duke of Parma; but it was retaken in March, 1590, by Prince Maurice of Nassau, by means of the following stratagem:—A vessel was loaded, apparently with turf, of which the besieged garrison was greatly in want, but under the cover of a party of soldiers were concealed. Admission into the town being thus secured, the soldiers left their place of concealment during the night, and having overpowered the guard, opened the gates to Prince Maurice, who had advanced with his army. In 1624 Breda yielded to the troops of General Spinola, who commanded the troops of the Infanta Isabella. In 1637 the town again came into the possession of the States General of the United Provinces, and was confirmed to them by the treaty of Westphalia. The French, under Dumourier, took Breda in 1695.
fact, the French even now (January, 1836) are only pos-
sessed of the city of Algiers and a small district around, and
of the towns of Oran and Bona, and one or two more points
on the coast. All the rest is in possession of the bey of
Constantina, and of the Arabs and Kabyles, who are at
war with the Mohammeds.

Bredow wrote also a 'Chronicle of the 19th Century,' in
which he spoke of Napoleon's power, then at its height,
with a boldness that accorded him a name among the pa-
triarchs of political journalism."

BREEDING is the art of multiplying the domestic
animals rapidly, and at the same time improving their
qualities.

Any breed of animals will perpetuate itself provided there
is a sufficient supply of food, and that the breed and the variety
found in a wild state must depend in some degree on the cli-
mate and the products of the country in which they are
found. Care and domestication also produce varieties,
which are much more useful or profitable than the wild
breds; and in the selection of the best individual to
regenerate a useful race, and in the rearing of the young,
consists the art of the breeder.

Without entering into particulars, which vary with every
species of animal, and with the different varieties of the
same species, it may be said that the general principles of the
breeder's experience have proved to be correct, and which being
attended to will greatly promote the improvement of all the
different animals usually bred for the use of man,
whether for his sustenance or for his pleasure. The first
thing which should be attended to in view of the chief purpose
which the animal is reared, whether for labour and to assist
human strength, or for speed, to convey us rapidly from one
place to another,—whether merely for a supply of animal
food, or whether man has designed the animal for some other
purpose,—is that each of these cases distinct qualities are required;
and it is seldom that two of these objects can be combined in
the greatest perfection.

Having then determined the purpose for which any species
of domestic animal is intended, the animal must be attended
to which further this view; and except under very pecu-
liar circumstances the animals intended to keep up the
stock by their produce must be chosen with those quali-
ties in the greatest perfection which are essential to the
end. To add to the perfection of the breed, the constant
frame is essential to the due performance of the vital
functions. The skeleton of the animal should therefore be
as perfect as possible. The capacity of the chest, and the
healthy nature of the lungs are points which must never be
overlooked, for without these the animal cannot be of
much use; and if the animal is bred; for although a defect
may in some measure be counteracted by a judicious choice of
the individual coupled with the defective animal, it is only where
there is no alternative that any deficiency in the vitality of
an animal kept for breeding should be overlooked.

Bredow also says that it is the same with respect to the
care of every care the defect will appear in the offspring;
sometimes not till after several generations. If it were possible
to find individuals without fault or defect, no price would be
too great for them; and those that are to work off badly
selected for several generations it is real economy to give
a very liberal price. In horses bred for racing or for the
chase experience has fully proved the truth of this rule
and no one who pretends to breed race-horses would breed
from a mare which had a natural defect, or a horse whose
whole pedigree was not free from fault. For mere swiftness
the shape of the animal, whether horse or greyhound, must
combine strength with great activity. The chest must be
deep, the lungs free, and the digestive organs sound but
and it is the less easy to be the better; for the health of
a horse or horse, or of a good breed, if in health, will die of exertion sooner than that of a
weak one with chace. Any defect in courage in an animal intended for
great occasional exertion renders him unfit to be selected to
continue an improved breed; and whatever may be his per-
fection.

With respect to animals whose strength and endurance
are their most desirable qualities, a greater compactness
of form is required, a greater capacity of the digestive
organs, and, according to the climate to which they may be exposed, a
thick covering of hair is equally serviceable in
both cases. Hardiness of constitution is hereditary, like
other qualities; and the manner in which the young are
reared tends greatly to confirm or diminish this. An animal
of which the breed originally came from a warm climate,
as a tender exotic plant, will require artificial warmth for the
healthy growth of its limbs; while the indigenous and more
hardy breeds may be left exposed to the elements.

An abundance of wholesome food and pure water is essential
to the healthy state of every animal, as well as exercise
and a change of air. In the care of the young, the strength
which it is obvious must be carefully attended to. There
are others, the result of long experience, which are equally
necessary to be known, but which are not so obvious. These
vary according to the species and variety of the animals
bred; and others appear to be the result of an art not
derived from the known qualities of certain individuals, and
of which no very good physiological account can be given.
That high withers and a freely moving shoulder-blade in a
horse are connected with his speed is readily perceived,
and the idea of the value of a horse, of the useful and
powerful zones of his body, and of the manner of his insertion,
should affect his power is equally evident; but it is not so apparent that the manner in
which the ears are placed on the head, the shape of the nose or jaw, the form of the
feet or the structure of the body are of such important effect on the value of the animal, independently
of any arbitrary idea of beauty. A breeder who should not
attend to these circumstances in the animals chosen to per-
petuate the breed would find, to his cost, that it is more
profitable to sacrifice his animals to a manufacturer of
surface, than to build up a character on the result of observation and experience that certain breeds
are invariably distinguished by certain peculiarities, and
that these are as much as invariably connected with good
qualities, apparently quite independent of the parts on
which the points are aimed.

There is an indication of the disposition of an animal in
the eye, in the shape of the head, and in the manner in
which it is carried, which seldom deceives an experienced
judge. He will not risk introducing a vicious or sulky dis-
posed individual, for the sake of a bad point; and in
equipage the colour with some defect, and those who breed for
profit by sale must be ruled by the taste of their customers.
The rational mode of proceeding is to be well acquainted with
the anatomy of the kind of animal which we make the
subject of our attention; to learn by experience what are the
peculiar qualities of the different breeds, distinguished by
any particular feature, and whether these qualities have any
apparent connexion with the peculiarity in make or colour.
We may then be guided by the knowledge thus acquired in
our choice of individuals, and may then and there only
preserve the useful qualities which they already posses,
but gradually improve them. No greater mistake can
be committed than that of making what are called violent
crosses, such as coupling a very spirited male with a slug-
bered female, the result of which will be a long, slender make, a long-limbed animal with a compact one.
By such crosses the first produce has often appeared much
improved; but nature is not to be forced, and if the breed is
to be improved, inexplorable defects are certain to follow.
The safe way is to choose the animal which is as nearly
alike in their general qualities as possible, taking care that
where there is a defect in one it exist not in the other, which
would infallibly perpetuate it. A defect can never be re-
paired by means of another of the opposite kind, but, by
great attention, it may be diminished gradually, and at last
disappear entirely. This refers however to defects; not to peculiar qualities. Cows, for example, may produce either milk or fat in abundance from similar food; and a species of cow, which secretes too much fat, so as to be deficient in the milk necessary to rear the calf, may be improved by selecting those which give more fat and less milk than the breed with these; but we must be cautious not to choose individuals which differ much in shape from the breed to be improved. A cross between a Herefordshire cow and an Ayrshire bull might possibly produce a good cow, but the breed of the calf would be uncertain. It is not for fattening or for the dairy, and nothing but ill-formed cows, deficient in milk, and slow-feeding oxen, are likely to result from it. Every attempt to unite opposite qualities is generally attended with evil results. Yet, behold how too great an aptitude to fatten, so as to engender the symptoms of waste of the mother or health of the offspring, the only remedy is to diminish the food; and if, on the other hand, a difficulty is found in fattening cows which are of a peculiarly good live stock for that, be good, but slow. The food, and other small breeds, the loss on the old cow sold half fat will have been amply repaid by the milk she has given; and the bull-calves which are not wanted to rear for bulls, if they are not profitable to fatten as oxen, must be fattened off young and sold for veal. But it is not a necessary consequence of an abundant produce of milk, that the cow, when dry, will not fatten readily; although a great propensity to fatten renders the breed less fit for the dairy. The Ayrshire, which are good milkers, fatten well when dry, and the oxen are less likely to be poor feeders, than other breeds.

Many breeders have an idea that coupling animals which are nearly allied in blood produces a weak race; others consider it as a prejudice, and among those who held the latter opinion was the famous breeder Bakewell. Without denying the bad qualities which may be produced by this relationship, provided individuals equally perfect can be found of the same breed more distantly related. Every individual has some peculiar defect, and his descendants may still have a tendency to this defect. If two immediate descendants are produced by animals which were well-conditioned, whereas by uniting the descendants of different individuals of the defect of either of the parents may never be broken out; but sooner than retrograde by coupling an inferior animal with one in an improved state, we should not hesitate to risk the consequences supposed to arise from what is called breeding in and in, that is coupling animals nearly related in blood, especially if only on one side, such as the produce of the same male by different females, or of a female by different sires. Many breeds which distinguish animals in which the muscles and bones are well connected, by being of a different breed, dogs, horses, and working oxen, are very different from those of animals destined to accumulate more tender flesh and fat for human food. In the former there must be spirit, activity, and in the latter, there must be roominess of the proneness to sleep are advantageous. In the first, the lungs must play with ease, and the muscles be strong, and not encumbered with fat. In the second, the lungs must be sound, as they are essential to all the secretions, and the digested food must be assimilated and not be accelerated through the bowels by exercise, but the absorbent vessels of the intestines must draw all the nourishment from the digested food. The more the muscles are impeded with fat, the better the animal will repay the food given to it, and that animal which can produce shall get fat readily, we must attend to this part of the constitution, and care little about spirit and activity. The tendency to secrete bone, and those parts which are called offal by the butchers, as being of inferior value, is a defect, whereas the muscles and bones are the principal parts of the body.

The manner in which the more solid parts of the body are formed, and the greater consumption of food, in proportion to the increase of weight which takes place in young animals, while bones and horns are growing, prove that it is a different breed and of a different species from the present muscular fibre than fat. Hence it is evident that the greater profit is in fattening animals that have finished their growth; and also that there is a superiority in those breeds of which there are small bones and no horns. This is an important point not to be attended to by a breeder; as is also the time when the bony secretion is completed. A breed of animals that will cease to grow, or have attained their full size of bone at an early age, will be much more profitable to the grazer than of one slower growth. It is in this respect chiefly that certain breeds of sheep and cattle are so far superior to others. The principles which apply to cattle are equally applicable, mutatis mutandis, to sheep. In no case are strong bones or horns of much importance to the sheep in its domestic state. The principal objects are to produce a well-made and fleshly animal, and to get fat stock, and perhaps incompatible qualities.

The attempt to unite the two is perhaps the reason why the Spanish breed, which has been improved when transported into Saxony, has degenerated in England; so that even its crosses are not in general of great value now. It is a fact that the breed kept for their wool chiefly are more profitable than those which give an increase of meat at the expense of the quality of the wool. A breeder of sheep who attends only to the quality of the wool will not have the same attention to the production of a fat animal, or the cencency in the carcass, or the disposition of the animal to increase in flesh and fat. It is possible that mixed breeds may be more profitable than the pure. Fine wool may not repay the breeder and the sheepman for the cost of feeding and good meat. But the principle we contend for is, that of producing the most perfect animal of any one variety existing, by correcting individual defects gradually, and avoiding fanciful crosses, which may destroy in one generation the improvements obtained in a great many.

Hence it is a matter of great importance to consider well the qualities of the individuals with which you begin your improvement, and to know that these qualities have existed in their progenitors, and are not merely accidental. If crossing espouses it may be necessary to proceed cautiously. No experienced breeder would ever expect to improve the fleece of a sheep of the Leicester breed or the carcass of the Merino by a direct cross between these two breeds. The offspring would most probably lose all the qualities that were in the pure breeds, for a country mongrel breed worth little in comparison. But a cross of Merinos with South Downs, or Leicester with Cotswold, might produce new and useful breeds, and these, carefully selected, as has been done, have produced mixed breeds, which has more room to manoeuvre than the country mongrel breed worth little in comparison. When it is determined what breed of animals you wish to perpetuate and improve, the individuals which are to be the parents of the stock cannot be too carefully selected. The more nearly they are alike in form, colour and exterior appearance, the more likely they are to produce a distinct race. They should neither be above nor under the usual size. They should be of such an age as to have entirely ceased growing, and be arrived at perfect maturity; and, whatever may be their good qualities, they should not be used till they are the product of very aged parents, at least on the female side.

In horses and horned cattle many breeders prefer a male rather less in size than the female, and pretend that the reason is, that the male is more susceptible to freshen. It is a truism that a female should be the larger. The expression is however a misapplied term a roomy female. There may be some truth in this, but equality of size, or rather the due proportion established in nature, seems most likely to produce a well-formed offspring. Any considerable deviation from this is generally attended with defect. Nothing is more common than, for a country gentleman who has a useful favourite mare, not particularly well bred, when any accident has rendered her unfit for work, to have her covered by some very high-bred stallion, expecting to have a very superior foal. Sometimes this succeeds, but in general, the inferiority of the male is so pronounced that the mare be small. A much more certain way is to choose a half-bred stallion, nearly of the size of the mare, and having those good points which the mare already possesses. In this case there is every probability of rearing a well-proportioned and well-formed animal, and it is on these points as the breeders call them, probably from the very circumstance of these crosses not succeeding in general. We advert to this as a fact which many of our readers may know from experience.

To give in conclusion a few of the rules which result from what we have very briefly stated:—

Choose the kind of animal which you wish to breed from, having distinguishing qualities; keep these constantly in view and reject all individuals which do not come perfectly at least as in the parents. Select the most perfect forms and let the defects be corrected gradually. Have patience and perseverance and avoid all attempts at any sudden alteration by bold crosses. If possible, breed two or
more families of the same kind, keeping them distinct, and only occasionally crossing the one with the other. In this manner, the breed may be produced. The nearer you approach to perfection the more difficult will be the selection, and the greater the danger of retrograding. Hence in very highly bred stocks it is often almost impossible to keep up the perfection of the breed, and a fluctuation in its quality is the probable consequence. If improved the breed is, therefore, the greater attention must be paid in the selection of those which are to continue it. And for want of this, almost every breed, however reputed it may have been at one time, gradually degenerates, and ceases to produce anything but breeders.

As every farmer and occupier of land is more or less a breeder, if he be only a breeder of pigs, these observations may be useful. In the articles on each particular species of animals, these general principles are applied and more particularly illustrated.

**BREGENZ, CIRCLE OF (also called the circle of Vorarlberg), forms part of the Austrian earldom of the Tyrol, and is bounded on the N. and N.E. by Bavaria, on the S. and W. by Switzerland, and on the N.W. by the lake of Constance. Its area, according to von Leder, is about 1560 sq. m., within which there are 3 towns, 7 m. t., and 412 vll. Being traversed by the lofty range of the Adler (or Eagle mountains), an offset of the Rhätian Alps, which separates the Tyrol from the Austrian country, and full of forests: it possesses also fine tracts of pasture land, the grazing of which forms the principal occupation of the inh., and it produces abundance of wine, fruit, and potatoes, but not grain enough for domestic consumption. In the vicinity of the town, its breadth is about 23,600 m. In the good climate of the Rhine, which flows through the town, its breadth is about 89,600. Bregenz, the capital, is an open, busy town, beautifully situated on an eminence at the entrance of the Aach into the lake of Constance: it is one of the oldest towns in Germany, is well built, and is divided into the old town, which is surrounded by a wall, and newer town, which spreads along the shores of the lake. Bregenz contains the head school of the circle (Haupt-schule), three churches, two monastic establishments, an orphan asylum, a hospital, and a number of houses of commerce. The town has a post office, and a number of banks. The annual value is about 23,600. The productions of the immediate vicinity are grapes, fruit, wine, butter, and cattle; the townsmen spin flax and cotton yarns, weave cottons, bleach wax, sell considerable numbers of articles of wood, frameworks, and complete fittings of iron, and skins of sheep, and skins of cattle, which are sold in the neighboring Swiss cantons. The yearly amount of the commercial transactions of the town has been estimated at nearly 200,000 fr. sterling. The old castle exhibits vestiges of Roman construction, and appears to have been formerly a place of considerable strength. The Gerhardshof, a high mountain, on which stands the ruins of the once spacious stronghold of the counts of Montfort, is in the neighborhood. 47° 30' N. lat., 9° 42' E. long.

**BREHON LAWS.** The ancient laws of the Irish, so called because they are in the most barbarous language Brethaimhuin, or Brehons. Feisichtas however and Brethia-neimeth, words signifying respectively ancient laws and sacred ordinances, are the terms commonly applied to the collection of these writings by the native writers.

Prior to the Anglo-Norman invasion, Ireland was wholly governed by the Brehon law; and, notwithstanding the statements of Spencer, Davies, Cox, and others, that this was an ancient law, there is abundant evidence to prove that some of the collections of the Brehia-neimeth are of equal antiquity with the oldest manuscripts of Irish history, whether civil or ecclesiastical, an antiquity which carries us safely back to the earlier ages of the Christian era.† The extant collections are numerous and authentical, but the labour of translating, methodizing, and illustrating them must be that of years; so that nothing has been done to establish the Brehon law as an historical and ecclesiastical work. The Brehon law is of the same system as the celebrated laws of the Irish under these laws as their available fragments, compared with the general history of the country, would point to the reader of the various accessible authorities on the subject.

The liberal extension of the Brehon laws from province to province, counties, baronies, and townlands would appear to correspond pretty nearly with the old territorial distinctions of minor kingships, lordships of countries, chiefries of clans, and presidencies (if we may use the term) of villages; all subject to the dominion of the king, or the king, or the tributary, one to another, among themselves.

The law governing this community is distinguishable into the common and, to speak, the statute law. And, first, as to the common law, or immemorial custom of the people, nothing is more necessary to be derived chiefly from the reference made to such usages in the remaining fragments of the written law; for at this day there remains scarce any oral tradition available on this subject in Ireland. The practice of the old society in ancient Ireland was patriarchal and pastoral. By the common law of the tribes, the ground belonging to each seems to have been divided into common pasture lands, common tillage lands, private demesne lands, and private houses. The demesne lands and houses are owned by the tribes as a body, and when the tribe gives up them then the right to pasture as many cattle as he possessed on these common grazing lands; and in proportion to the number of cattle thus pastured by each was the share of the common tillage lands assigned to him on the annual distribution of the rich harvest from which all the demesne lands were the distinct property of individuals who were entitled to acquire and transmit such possessions by certain qualifications not very clearly explained. The deeds of this work; but the reader who wishes to investigate the subject is referred to the elaborate treatise on the Brehon law by Dr. Blaikie, and to any work on the ancient law of Scotland, which has been written by that learned man. We have now come to the review of the existing law only of the more interesting testimonies which may be adduced. Arca, or the Brehon law, is a mixed system, and its origin is covered with obscurity. The superior courts, known as the general council, held annually, was now restored in the 10th century; hence, whereas, the council was supposed to be derived from the old tribal law, and hence the belief that the Brehon law was the law of the ages. And it is the belief of another writer that the Brehon law was the law of the ages, and that the Brehon law was the law of the ages, and that the Brehon law was the law of the ages. And it is the belief of another writer that the Brehon law was the law of the ages, and that the Brehon law was the law of the ages.

† To enser at large into these proofs would be incompatible with the design.

* These terms are still the subject of etymological dispute: the translations given are those most generally received.

† To enser at large into these proofs would be incompatible with the design.
members holding in common. But co-existent with the first practical development of such a system, if not actually contemplated in its very rudiments, arises the necessity of providing for those members of the community who, either by reason of old age or infirmity, or on account of their particular kindreds, and have thus no proper Fianna with whom to claim a share. Such individuals could not expect to participate in the rights of blood enjoyed by those tribes among whom they might be dispersed, neither could they be received by the community of those tribes as tenants on their fluctuating possessions. To provide for them, it was necessary that a certain portion of the land should be set apart for the reception of strangers. To prevent the confusion of many landlords, the profits of these several tenements were invested in the hands of the chief, for the latter to exact a lighter tribute from the Fianna of his tribe. To induce the better sort of strangers to settle among them, the chief was empowered to grant some of these tenements in perpetuity, but the greater portion was usually let at will. For those who were not tenants of the chief's protection, they were received on his private demesne lands and became his serfs. Admission to the upper class depended on the stranger's ability to pay the entrance fine on one or more of the disposable tenements. These tenements consisted of a homestead and a certain scope of ground annexed. The homestead was designated a Rath or a dwelling-house, an ox-stall, a hog-sty, a sheep-pen, and a calf-house; these buildings were generally surrounded by a fort. The Rasnaeth and Rath were the symbols of title as well as of residence. There is one very prevalent error with regard to ratha in Ireland; viz., that they were Danish erections, and designed solely for military occupation. The term "Danish rath" is altogether a misnomer, as no similar erections are known in Danish history. The latter part of the brehon law, were drawn solely from the circumstances of their erection and occupation by the natives themselves; as for example, among many others, the Fianna-rath, a homestead occupied by the owner of the land who a Med-rath, one rented by stranger tenants for the first time; an Is-rath, one occupied by stranger serfs on the chief's demesne lands; a Sio-rath, one of which the stranger tenant enjoyed the perpetuity; a Forgus-rath, a secondary tenement appurtenant to a homestead with a certain scope of ground called a Path. Now these terms are pronounced respectively Feuer and Peu, the identical words still employed in Scottish law to indicate the freeholder and his freehold. Hence that they are the radical form of the other feudal derivatives, such as a villein fee, &c., is quite clear. It would appear that the Irish tended to consider more closely the relative situation of the Irish fee-feudal. It will appear that there is something in it very analogous indeed to the older forms of pure feudal tenure. First, the allotment of the soil vested in the representative of the tribe, so that the baron of the rectorial holding of the chief might be considered as in capite, with a power in many cases of granting mesne tenures to others. Secondly, at the death of the chief a stapled fine was paid to his successor. Thirdly, females could not inherit. Fourthly, raths and homesteads were common, and the Fianna was not confined to serve the chief in war, and to diet certain numbers of his soldiers at all seasons. Of the more minute characteristics of the perfect feud as introduced by the Normans into England, such as escuage, wardship, ransom, &c., &c., there are so far few discoverable traces, but enough has been shown to give good ground for considering the Irish law of feuars, connected as it necessarily was with the pastoral constitution of their society, as the original form of feudal tenure among all the Celtic nations. Feuars were classified according to the circumstances of their position. Some had left their former tribe to seek their fortunes; those whose tribe had been dispersed in war, and those who had fled or been expelled their tribe for debt, for robbery, for piracy, or murder. The first three classes only had the privilege of the coming residence on being restored to the protection of their original tribe, to a temporary protection, which they paid for by cattle or hand-service, on the private demesne lands of the chief, until he should compound with his prosecutors, after which they usually became his serfs or bondmen. Bond-feuers were
attached to the soil; the lands to which they were assigned being
denominated Betagh lands, and they themselves being
frequently granted with the soil, as appears in many
antient deeds, where they are special mentioned in the
name of Betaghs.

Thus then it would appear that the country was occupied
by kindreds called Finn, holding for the most part in
common, and by Fenagh, who resided either by
emigration, or as vassals of the chief. The tributes of chief
to superior chief, up to the supreme king of the whole
island, were regulated by established precedents. The collec-
tion of these rules for the kingdom of Munster is entitled
'The Eayers of the Law,' and is still used by the
tribes of chiefs.

So far of the common law; next as to the statute law of the
Irish. Whether these particular enactments were decreted by a
general assembly, as asserted by some, or by local chiefs, as
affirmed by others, is a question not present to point out
by a party of any importance. The collection containing
them, of whatever age, profess to be but tran-
scripts and collections, with frequent references to similar
compilations of still older date; but the text appears
to be original, as its dialect is so antiquated as to require
the assistance of the learned to decipher it, and even when translated not by any
means easily understood. The collections are interspersed
with numerous moral sentences, occasionally also with su-
persistious dogmas: as an instance of the first, 'Heaven is
the Friend of the man that serves God, and men are
the Friends of the man that serves men.' The second
is the farther it flies from you;' and as an example of the
second, 'There are seven witnesses against a wicked king;
viz., division in his councils, strained interpretation of the
laws in his court, death, barrenness of cattle or lack of milk, a
pestilence in the land, and a night of darkness in the
ground; these are as lighted candles to expose the
misgovernment of every king.'

The number seven would seem to have been held in
much the same esteem and the mystic number three. There
are the instance, 'seven classes of persons whose anger is
not to be resented; viz. bards, commanders, women, pris-
ioners, drunken persons, druids, and kings in their own
dominions. There are again 'three deaths not to be be-
moaned; the death of the flint, the death of the fat
beef; the death of a proud prince.' things again which adv.
ance the subject; 'to be tender a good wife, to serve a
good prince, and to be obedient to a good governor.' In
this last example the same idea is repeated in order to
complete the oath. What time can have been so pressed to
reside in these peculiar forms of expression it is hard to
conceive. The only assignable reason for their use seems
to be that they were thus more easily committed to memory.
The system however does not appear to have been used to
any great extent, as we find no record of their use in
sermons, or other religious discourses, or in the form of
laws. The code of Felim Reachtair, the Lawgiver, the lex talionis
vailed in Ireland, and that he altered that code for a system
of retribution by mutilation only. A.D. 164. Partridge, rape,
rave, and murder, under certain circumstances, still remained
punishable by death; but whether in consequence of this
reform in the old law, or by immemorial custom, all other
offences were theretofore provided against in the brehon
law by definite fines. The retribution thus exacted was
denominated Eneclan or Eriu, terms applicable also to
punishment by the law in general. It is said to this day
by the people of Felim Reachtair, or the Lawgiver, the lex talionis
vailed in Ireland, and that he altered that code for a system
of retribution by mutilation only. A.D. 164. Partridge, rape,

follows so many cows." Hence, in all likelihood, the term Bally-boe, i.e., cow-land, a term which has perverted many writers, in consequence of the varying extent represented by it at different times and in different districts. It appears therefore that by leasing all mutilations for infringe- ments of the exclusive rights of the tenant, the most effective method of making their punishments tell on the whole condition and standing of the offender in his tribe, for punishments so inflicted showed themselves, more or less, in every circumstance of his life and fortunes, and affected his landed property in all cases for a whole year at least.

In calculating by the measure, it was necessary again to fix a standard of available aliquot parts. The number three was found most convenient, and accordingly the cumhala, a general expression of fixed value, was made to consist of three parts, and the proportion of every quantification with which all other proportions of value were usually regulated. Seven cumhala, or twenty-one cows, was the usual eric for murder on the highway. This will appear, at first sight, a very inadequate retribution, but it is not quite clear whether the relations of the deceased could not possibly recover an eric from the murderer, and as it is an accompaniment of the punishment in this offence, that the criminal loses all right in the common tillage lands of his tribe, no matter how numerous his herds may be, after sifting through the provision of the Code, it can be stated that the code does not perhaps have been so much disproportionate as it would otherwise appear. Sull the possession of numerous herds might thus purchase the wealthy man a privilege of violence.

To guard against this, the liability increased with the rank of the injured party. If a man was killed at the hands of the chief, or the most influential man at one, that of the wealthy boor (bo-airrugh, pronounced boo-ørri, i.e., a person rich in cattle), would be represented by two, that of the flast or petty chief by three and a half, and so on to the righ or lord of the country. This system was particularly well suited to the social state to one. Robbery was, in like manner, with this salutary provision, that if the robber could not be discovered, the holder of the stolen goods should pay his eric. The sanctity of marriage was strictly guarded; the injured husband had rights both in person and property at the hands of the law; failing him, he might levy retribution on his wife's brothers; failing them again, on her foster-children; and finally, if she had no relations, or if none of them were solvent, her tribe at large had to pay the penalty of her crime. Public orders have been attended to with peculiar strictness and care. Hibertto have spoken of lands held in common, whether for pasturage or tillage, where there could be no fences, and consequently little trespass; but, before we enter on the code of trespass, we must premise that the tribes have denounced the private demesne lands of the tribe in which the Darbh-Finné possessed their distinct inheritance. In the present stage of the inquiry, it cannot be precisely ascertained how this inheritance was acquired; but it is known to have been by purchase, by force of arms, and by law, and distinctly recognized by Sir James Ware, who admits them to have been freeholds. These lands not being subject to yearly repartition, were permanently defined and fenced, and the exclusive possession enjoyed by their holders is evidenced by the extreme rigidities of the law decreeing their inviolability. First, we have the legal fence defined; viz. a trench, two feet in width at bottom, three feet in depth, and three feet in width at top, with a ditch raised on one side, of these dimensions and materials, viz. twelve hands of stone, two feet thick: the whole piled over and over with earth; and even the ashes of the dead were to be scattered over the site. The total enclosure was inclosed by a second fence, viz. a wall of stone, three feet thick, the whole raised to the height of twelve feet, with a chamber in each corner, which was to contain a sufficient supply of cinders and ashes for the burning of the trespassed against trespass on timber. The classification and comparative valuation of trees in a country which has usually been considered a wilderness of forests cannot fail to be interesting. Timber was divided into four classes—airigh, athair, foggal, and loss timber; and the fines for trespass on each were thus proportioned: airigh timber, viz. oak, ash, hazel, holly, yew, and fir—for cutting the trunk, five cows; for cutting or maiming the limbs, a heifer; for the branches, a two-year-old. Athair timber, viz. alder, willow, hazel, quick-beam, birch, and elm—for killing the trunk, a cow; for the branches, a heifer. Foggal timber, viz. black thorn, elder, spindle-tree, white hazle, aspen, lime, rowan. Loss timber, viz. wild cherry, birch, hawthorn, furze, briar, heath, ivy, broom, dronn—three cows for destroying these trees by the number of swnipe its branches could give shelter to*

But perhaps a more remarkable law is that of the Irish brehon regulating the property in bees. Honey and wax must have formed a large portion of the wealth of those years, and therefore the possession of property so hard to fix as that in a swarm of wandering bees had never been calculated and laid down with such scrupulous nicety. In the first place, the bees themselves are protected by severe enactments against injury of whatever kind. Next, they are to be left free, under heavy penalties, to choose their own place of swarming: "to bind the bees" by casting up dust, or taking any other means to force them to descend and swarm on one's own land, while they are flying out of the lands of another, was an offence for which no less than five cows were taken from the tribe and territory. The bees having voluntarily settled on a tree, it then depended on the rank and privileges of the owner as well of the bees as of the tree they had chosen, what was to be the portion of wax and honey received. The law consequently directed that they should continue to receive that share, as the bees in all cases ultimately became the property of him upon whose tree they had alighted. The commentators on the old text here complain very bitterly of the clergy, who, it would appear, were particularly encouraged to collect swarms to their abbey orchards, where they did not scruple to cover them with sheets, and take other unfair means of securing their stay among them. If the bees, however, were found beyond the sound of a church bell, or the crowing of a cock, at the woods or glens, without being solicited by the priest, the whole proceeds, excepting a ninth part, which he had to pay by way of tribute to the chief. If these laws have been rightly translated, the old Irish must have possessed the secret of abstracting the wax and honey without destroying the bees, or even collecting the swarms; and the regulations regarding this species of property so copious; in fact it would require all the space here devoted to this subject to explain the minute and complicated decrees of the brehon law regarding bees alone.

It is equally necessary to enter fully into the law of watercourses, the enactments on which are very remarkable, inasmuch as the property of the whole water of a stream vests in him out of whose land it first springs, so that the owner of the fountain could levy tribute even on those bridges which were fifty miles from his land, and extend it to other men, as well as on all houses (save those of the chief, the head villager, and the miller,) whose occupants drew water either from the fountain or the stream. Millers were a class peculiarly favoured in these laws: their mill-races were exempt from tax free; their mill-rights, while pursuing their trade, could not be prosecuted for trespass; and, as above stated, their households were exempt from tribute on all water drawn for their consumption. It is worthy of remark that by the Jewish law the mill-stone could not be confiscated.

The law of roads is not very ancient; it was of some length; but of the law of roads only one section hitherto has been found. This section, however, is well worth notice, as it contains proof of a much more general design in these laws than we might otherwise be disposed to give them credit for. It provides that the space of the castle or fort road that shall be left from high-water mark along the sea-shore for the construction of a public coast-road round the whole kingdom. It is said that some traces of such a road are still to be seen upon the Irish coast. Valency states that in his time the country was inhabited by a species of butterflies other writers mention the remains of a great inland causeway somewhat similar to the British Watling Street, crossing the country from Dublin to Limerick, which was probably the effect of a similar provision for inland communication. The law of feeding is more fully stated. Every member of the Dathang-Finné, or gentry of the clan, was bound to

* Leges Ian., Lambard., No. 43.
send his male children to foster with some family of the
In-finned or commonly: for it was provided that none but
fosterers could claim full eric. The Brégar or foster-fee
was a stated sum payable by instamlers during the child’s
majority. It was established that the foster-father was bound
to pay one-half of his fines, in return for which the young
nolle or idil-man was ever after bound to protect his new kindred, and in particular to pay all fines
incurred by his foster-mother, except in case of adultery,
when the child left his first upon her father and brothers, if
alive and soluble.

The law of tuition provides for three chief branches
of education, viz.: knowledge of cattle, as being the first
and most important in a pastoral community; next, knowledge
of agriculture, and, finally, of navigation, instruction in
latter being an indispensable branch of each. These
attainments were acquired under tutors hired for the purpose, and
paid by the father or foster-father, according to the arrange-
ment of the Brégar, the foster-father himself being always
the youth’s instructor in all military and athletic exercises.
The tutors alluded to were the ollichie or bards, who also
acted as clerks and notaries under the bréhon.

The offices of these functionaries, as well as of the physician, were bire-
editary, but not, as is generally supposed, subject to the law of
primogeniture; the jurist, poet, or doctor, being at liberty to
select from all of his own name those apprentices whom he
might think most promising in his peculiar profession.

The law of physic proportioned doctors’ fees to the rank
of the patient and the nature of the complaint. If a cure
was not successful, the patient had the right to sue for the
amount proved successful the recompense was very liberal, as
fourteen cumhals or forty-two cows for the cure of a bishop or
provincial king, seven and a half cumhals for that of a
lord of a country, three for that of a bovaré, and two for a
merchant.

It is disputed whether the new series of enactments were
sumptuary or merely valutary. Doctor Ledwich adopts
the latter opinion, but the tenor of the translated fragments
would seem rather to imply the former. They are said to have been
introduced into Ulster in 1589, the year in which Elizabeth
had a king who lived in the second century. By them a
certain value is established for various articles of dress and
luxury, as, for example, a mantle wrought with the needle is
valued at a steer or heifer. The dress of a petty-chief’s
lady is estimated at three cows; that of a head villager’s
wife at two; that of a bard and his wife together at three;
and that of a bishop at six. The bodkin or brooch of any
one under the rank of a bovaré was in like manner priced
at three heifers; that of a bovaré at three; that of a Fiath or
petty-chief at a cow; that of a country lord at a cow and a
third. Of the same value in each degree was the bridle.
The belt was estimated proportionately at about a third;
and in like manner with regard to arms and armour, drinking-
cups, &c. &c.

As some, of old, there is nothing preserved which so
far throws any light upon this portion of the inquiry, except
one very interesting fragment, viz., cases of disputed inher-
tance of lands were to be judged by twelve voices, one dis-
sentient voice invalidated the verdict. This was the ancient
law, and the commentators generally agree that the hardship of its
extreme strictness occasioned its practical repeal.

Such, so far as can be collected from the present ill-
arranged and defective materials, would appear to have been
the old system of rude jurisprudence under which the Irish
people lived and continued to live until the Norman
conquest of the twelfth century. The conquerors brought their own laws with them; but the progress of the more complicated and
formal feudal system of the continent in displacing its primitive
originator and rival was necessarily very slow. The bréhon law
offered many attractions to ambitious individuals desirous of
establishing a self-contained despotism in each of their
several territories; and while the particular duties and
services done by the new feudal law were rigorously exacted,
the general privileges of the English constitution were denied to them, both by consent of the crown, and thus participated in the evils of both systems; for the pro-
tection of judicial trial by the law of England could not be
claimed by the serfs of remote districts; and the power of
the conquerors was too arbitrary to permit any operation of
the regular courts. The Norman lords, therefore, not far from
the sole interest of the lord: thus the poor native of the pale
was mulcted under both laws and protected by neither. It is not
surprising therefore that the lapse of a Norman noble into
mores Irish, by which he acknowledged the brehon code
alone, was anxious encouraged by his dependents; and such
were the inducements of the system itself for turbulent and
ambitious spirits, that few of the adventurous nobles who
settled in the pale could help but immediately avail them-
themselves of a new opportunity. To guard against defection so ruinous to the whole
policy of the conquerors, many statutes were enacted in the
parliaments of both countries. These at first were for the
encouragement of the English law only, but afterwards it
became necessary to take more effectual means of discouragement. The first positive act against the prac-
tice of the brehon law within the pale was passed by the
parliament held at Kilkenney by Lionel Duke of Clarence,
anno 1369; by which the offence is declared high treason.
This was followed by the 24th Vic. c. i. ii., and the
28th do. c. i., with similar prohibitions and penalties. The
prohibition, however, had little effect. The open defec-
tion of the great families of De Burgo, Bermingham, and various
branches of the Fitzgeralds, in Ulster, Connaught and Mun-
ster, kept the dangerous example constantly before the eyes
of the nobility on the borders of the pale, and each succes-
sive rebellion tended to increase the evil: for if the govern-
ment were successful, the border barons, on whom the main-
tenance of that advantage afterwards depended, were pro-
portionately more indulged; and, if the Irish prevailed, their
yielding under such compulsion was the more excusable. A
good example of the anomalous state of society produced by
the intermixture of the two systems on the borders of the
pale may be adduced from the reports made by various cor-
temporary writers, of the usual custom of the Irish and English
King Henry the Eighth to inquire into the abuses of the Irish
nobility anno 1537. The following is an abstract of some of
of the most remarkable complaints. All the freeholders, lay
and spiritual, charged their tenants with cowne and livery,
and they paid fees for their services, together with various
cashies, with black-men, with black-money, with the main-
tenance of mustrons, and with carriage and service in general.
Lord Kildare and Lady Catherina Poer not only re-
quired cowne and livery for their own horses and boys, but
that they pay for their services; and some of them, early
when either (Kildare) or Poer, or Osory, hunted, their dogs were sup-
pplied with bread, milk or butter. When the deputy or
any great man came to Lady Poer she levied a subsidy at her
pleasure for meat, drink, and, under the name of mertyagh. When Osory or Poer married a daughter,
the former demanded a sheep from every husbandman, and
a cow from every village; and when their sons were sent to
England, a tribute was levied on every village or plough-
man. Lord Kildare levied money for each horse and cow
bleaken, 5 marks for his want of vigilance. Sir Thomas
Butler exacted 10 marks at Easter, if his subjects had passed
the year without gallenglass or speramens. William
Bermynghama required 16 quarts to the gallon, in payments
for liquor and meat. Some of these were accounted
at prices fixed by themselves, and thereby were enabled to forestall the markets. The brehon, who was kept by
Lady Catherina Poer, took for his judgment, called
'sylogar,' 16d. of every mark sterling, both of the plaintiff
and defendant, &c. &c. Such extraneous practices, res-
ulting from the union of the worst parts of both systems,
the brehon law fell into extreme odium, but they are chiefly
the exorbitances and malpractices of this class which have
been quoted by English writers who censures it; so
that if the English government can in any degree be
said to have been at fault, it was in great measure undeserved. Indeed the nobility of the
pale seem to have established a separate code of laws for their
own government, known as the Sttites of Kilcyle; and we
find them, in the reign of Henry the Eighth, inflicting
a penalty of five marks upon a man, and the same
individual would be by any other law. If these statutes be the index of such
acts as those quoted above, it is little to be wondered
that the bréhon law, which bore the blame of all, should have
been denounced as it was. Great efforts were accordingly
made to supplant the bréhon law by the law of
Elizabeth, and by the Brégar, 3rd and 4th, and 3rd
Parliaments. Sir Philip Molyneux's law, the v.
was also directed against some of its effects; but it was not
till the 3rd of James that the final extirpation of the old
law was effected. The whole kingdom being then divided
into counties, each of whose several shires and circuits of
assize, the brehon law became a mere subject of inquiry
to the antiquary, and as such, at the present day, pos-
sees perhaps greater interest than any other branch of
Irish or Celtic archeology. The sketch here attempted cannot be free from numerous defects, and perhaps from some actual errors, or minor materials of a vague and sometimes defective. The original MSS. are written in a dialect so antiquated as to baffle almost all Irish scholars, and the accuracy of some of the existing translations, moreover, as they are, has been seriously questioned in question. It remains true, however, that the Society of Ireland, with which there is no lack of means for the undertaking, to make that use of the brehon law manuscripts in their possession, to which bodies professing similar objects in any other country of Europe, would long since have turned them. A professorship of the Irish Tongue is about to be established in the University of Dublin: and it is to be hoped that a step so long and unaccountably delayed may now lead to some result which will do away with the reproach in this regard at least on this institution. (MSS. in the library of the Royal Irish Academy, Trinity College, Dublin; Vallancey's Collectanea, vol. i. and iii.; Ledwich's Antiquities of Ireland; State Papers of the reign of Henry the Eighth (Ireland); Statutes of Ireland; Original Communications.)

BREISACH, OLD BREISACH or BRISACH, an ancient town on the Rhine, about 12 m. S. of Freiburg, is in the circle of the Upper Rhine in the grand duchy of Baden. It was considered the bulwark of Germany on the left bank of the Upper Rhine, and was termed the 'pillow' (kissen) or 'pillow' (kissen) and 'pillow' (kissen) of the strongest fortresses in Germany. The castle was built by Borthol, duke of Zähringen. Its vicinage was the theatre of obstinate conflicts during the Thirty-years' war, and was the scene of two victories gained by the Swedes over the Imperial forces. By the treaty of Westphalia in 1648 Breisach was ceded to the French, but the peace of Ryswick in 1697 restored it to the Austrians. Six years afterwards it was invested by Marshal Vauban, and betrayed into his hands by the Imperial generals, Count Arco and Marsigli, of whom the former was tried, convicted of treason, and beheaded at Bregenz. Austria regained possession of the place by virtue of the treaty of Rastadt in 1715, and its works were afterwards rendered much stronger by the erection of a citadel on the right bank of the Rhine. In 1744 the French, under the command of the Dauphin of Orleans, took the place, but they evacuated it and recrossed the Rhine, after destroying the town and its fortifications, as well as the ancient tower, the only remains of the original castle which the hand of time had spared. Part of the town was burnt by the French during the revolutionary campaign in 1793; three years afterwards, General Moreau, upon re-crossing the Rhine between Breisach and Höningen in his retreat out of Swabia, left a garrison in Breisach; and the French retreat across the Rhine at the instance of Kastner, governor of Aachen. In 1806 the French government transferred it, together with the Brisgau, to the house of Baden. Breisach is situated on a circular hill on the E. bank of the Rhine, between Basle and Strasbourg; and in conjunction with the par. of Hochsteiten, which has been incorporated with it, contains about 400 houses and 3200 inha., who are engaged in mechanical pursuits, trade, and navigation. There is likewise a considerable tobacco manufactory in the town. The Minister of St. Stephen, which has survived every calamity that has befallen the town, is a building of the same architecture, contains the monuments of several old warriors, as well as of other individuals of note. 48° 1' N. lat., 7° 34' E. long.

BRISLIIA, SCIOPONE, was born at Rome in 1748, of a family originally from Germany. Cardinal Scipione Borghese stood godfather to him, and gave him his own Christian name. Brislai early distinguished himself for his application to the physical sciences, by which he attracted the attention of the learned Stai of Ragusa, who offered him a seat at their Institute and the chair of philosophy in college newly established at Ragusa. In that city Brislai became acquainted with the Abate Fortis, from whose conversation he derived a fresh impulse toward the study of natural philosophy. After remaining several years at Ragusa, he went to Rome, where he was appointed professor in the College Nazareo. He mainly contributed to form the rich cabinet of mineralogy of that institution, and he made excursions to the hills near the lake of Bracciano, N.W. of Rome, to investigate their geology and mineralogy. He published the result of his ob-

ervations. Saggio d'Osservazioni sulla Tota, Oriolo e Latera, 1786. Afterwards, going to Naples, he was employed by that government in several mining researches, and in constructing a vast distilling apparatus on the volcanic mountain called La Solfatara. His health becoming seriously affected by these labours, he was obliged to desist, and was transferred by the king to the more sedentary employment of the military college of Naples. He made frequent perambulations through the province of Terra di Lavoro for the sake of geological research; the results of his observations are contained in his 'Topografia fisica della Campania,' Florence, 1795, afterwards translated into French, with additions by M. Guerin, and published in 1828, on the volcanic formation of the hills of Rome, 'Voyages dans la Campanie,' Paris, 1801. Breislai had been driven to Paris by the events of 1799. At Paris he was cordially received by Foururoy, Chaptal, Cuvier, and the other scientific men of that capital. Having returned to Italy at the end of the war, and having been in 1802 inspector of the national manufactory of saltpetre and gunpowder of the Italian republic, and member of the Italian institute. From that time he resided chiefly at Milan. He wrote several treatises on the manufactory of saltpetre. Del Salnito e dell' Arte del Salnitro, 'Memoria sulla Fabbricazione e Raffinazione dei Nitri,' 'Istruzione Pratica per le piccole Fabbricazioni di Nitro, da farsi dalle persone di campagna. Breislai continued in his office of inspector through the various changes of government, and also under the Austrian rule till 1815. The government, however, encouraged the study of geology, which was then still in its infancy in Italy, Breislai published in 1811 his 'Introduzione alla Geologia,' which he afterwards enlarged and published in French under the title of 'Institutions Geologiques,' Paris, 1819. The work of Brislai was immediately translated into German. Breislai was elected a member of most scientific societies in Europe. In 1816, together with Monti, Giordani, and Acerr, he formed the place of a new scientific and literary journal, called 'Breislai, a Rerum Novarum et Anterarum Memoris,' the twenty years, the first rank among the periodicals of that country. Breislai was one of the original contributors. In 1822 he published 'Descrizione Geologica della Provincia di Milano,' which was printed at the expense of the Austrian government, which is continued to the present day. The province of Milan, under the reign of Charles Albert, 15, 1826, universally regretted both for his scientific merit and his personal qualities. His rich collection of minerals has passed into the hands of the Borromeo family.

BREMEN, a duchy in the N.R., part of the kingdom of Hanover, bounded on the N. by the German Ocean, on the N.E. by the Elbe, which separates it from Holstein, on the E. by Lüneburg, on the S. by the Hanoverian earldom of Hoya and Brunswick, on the S.W. by the territory of the free town of Bremen, and on the W. by the Weser, which forms the boundary of the duchy of Oldenburg. Its area is about 2020 sq. m. It was merged into the bishopric (Landdrost) of Stade in 1823, and contains two municipal towns, viz., Stade, the seat of administration, and Verden, 30 royal jurisdictions (Aemter and königliche Gerichte), and 300 villages and hamlets, holds 190,000 souls (in 1827, according to Uebelbode, 187,600). The soil, which borders upon the sea, is a rich and fertile marsh-land, on the banks of the Elbe, from 1 to 7 ft. deep. The surface of the duchy is full of heaths and moors, some of considerable extent, almost entirely extremely unproductive; it is a uniform level, lies very low, and consists either of tracts of sand or swamps, interspersed with large blocks of granite, and very sparingly sheltered by thick and still forest. Cereals are always fruitful, and useful attempts have been made to render the best parts of this dreary region available to cultivation: in 1820, for instance, 64,000 Hanoverian or 41,000 English acres were brought under cultivation, and 57 wits. were laid out upon them. This is about equal to the produce of this part of the country. The principal streams in this duchy are the Easte, Bremer, Lübe, and Schwinge, which flow through it into the Elbe; and the Aller, Wümme (called the Lusum or Lossum near its mouth), and the Gerwlo, which fall into the Weser, the latter of which is often navigable by its approach to the mouth of the Elbe. The natives of Barnem are the Oste, which rises on the Wintermoor near Tisted, traverses the country from S. to N., and is navigable almost one half of its length; and the lesser Medem, which, as well as the Oste, enters the sea at the mouth of the Elbe. The largest town is that which unites Hamburg and Oste, and thus establishes a

3 3 9
communication between the Elbe and Weser. There are seven pieces of water, but none deserving the name of lakes; nor has the Weser any principal tributaries. The weather is temperate but variable, and the districts along the coast subject to storms. The quantity of land under the plough and pasture is estimated at about 450,000 Hanoverian or 294,600 English acres, and the extent of pasture and meadow land is between 170,000 and 220,000 acres. The growth of grain and other agricultural produce is more than sufficient for the consumption. Flax and hemp and fruit in abundance, as well as vegetables, are raised; peat supplies the want of wood for fuel. Considerable numbers of horses (above 67,000) and particularly horned cattle (about 113,000), which latter are one of the main resources of Bremen, are reared; the breed of sheep, which yield a coarse sort of wool, is less attended to, and the stock does not exceed 240,000; the number of swine is between 70,000 and 80,000. The general character of the land, in which rice and sugar and wax are objects of attention. The stock of game is inconsiderable; there are no fisheries of importance on the rivers, but productive ones along the sea coast.

The only mineral productions of the duchy are clay and fine fuller's earth; pewter also is dug. There are no large manufactories, though the spinning of linen yarn and the weaving of hessen linens and sailcloth, the making of potter's ware and tiles, as well as the manufacture of brandy and the extracting of oil of rapeseed, afford employment to a considerable number of persons. The trade is in a great measure dependent on the immediate produce and wants of the country; the exports consist of grain, beans, rapsessed, peat, and fattened cattle for the Hamburg and Bremen markets, wool, rags, fruit, oil, tiles, and coarse linen. The want of a harbor on the coast has long been felt; a navigation pound, then a fortress and now the town, but the establishment of the 'Bremerhaven,' on the right bank of the Lower Weser and left bank of the Gerste, bids fair to remove it. Many vessels are built and navigated by the inhabitants of these parts, and the sea; some few are exported to other countries.

The inns are all of Low-German (Platt-Deutsch) extraction, and speak the Low-German dialect. They are exclusively Protestant, and the majority profess the Lutheran form of faith. There are 128 Lutheran and 7 Reformed churches, and the Established Church has a congregation of no less than 50,000 in the duchy, and a sufficient number of national schools.

This duchy was originally a bishopric, instituted in the year 788, and was raised to an archbishopric in 849; it was secularized under the treaty of Westphalia, made over to Sweden in 1648, conquered by Denmark in 1712, and sold, with the consent of both parties, to Hanover, or rather the Electorate of Brunswick in those days; namely, by Denmark in 1715 for 600,000 dollars, and by Sweden in 1719 for 1,000,000. One portion of it formed the earldom of Hoya, known as the Land of Oldenburg; another as the archbishopric in the middle of the 12th century; an incorporation which subsequently gave occasion to violent disputes between the peasates in possession and the dukes of Brunswick.

BREMEN, the free Hanseatic state of, in the N.W. of Germany, is situated on each side of the Weser, between 50 and 55 m. from its entrance into the N. Sea, and as an independent power, it is one of the thirty-eight constituent members of the German Confederation. Its territory, which extends from 52° 1' to 53° 11' lat. and from 8° 32' to 8° 58' long. is intersected by the Weser, and is divided into the 'domain on the right bank,' and the 'domain on the left bank,' of the Weser, together with the bailiwicks of Wesermarschen, Bremen, and Worpschau, which, after their junction with the Hamme, bear the common name of the Luesum or Lusam, and flow into the Weser on its right bank, and the Oebum, Ochunu, or Oehme, which flows into it on its left bank. In addition to those rivers, it is full of watercourses and canals. It is better adapted for rearing cattle than raising grain, and little corn is grown, except on some of the more elevated spots. Fruit and vegetables are cultivated in the more immediate vicinity of the town; but the country is destitute of woods. The pastures are remarkably rich, and the breed of horned cattle is very fine. The territory contains one

town, two m. t., Vegesack and Bremerhaven, and 58 villas and hamlets, and is divided into 14 pars. The number of inhabitants is 65,000, and the present position of 57,000 souls; in 1823 it was officially estimated to be 55,453; and of this pop. about 41,500 inhabit the town, and 15,500 the adjacent dependencies. The inh. are of the Protestant faith, with the exception of about 1,500 Roman Catholic inhabitants. A few years ago this community, in the 'saint,' which consists of four burgomasters, two syndics, and 24 senators, and in the 'convention of burgessees' (Bürger- convent), which is composed of all resident citizens who pay any considerable amount of taxes; it is called together by the burgomasters, and no session is excluded from it on account of his religious opinions. The senators are chosen out of a certain number of candidates proposed by the burgesses, and elected by ballot by the senate: the senatorship is an appointment for life. The senators also have a charge to give the vote of the people, but ministers in this capacity: they are responsible to the convention for the due administration of the finances, and constitute the highest court of appeal in judicial matters. Some one member of the senate is placed at the head of each public department, and civic deputies take their places in the executive. The rights and control exercised by the former bishops now rest in the hands of the senate. The ministers of religion are elected by the flocks, but they cannot enter upon their functions without license from the senate, which has the power of granting or withholding it; of granting pardons, administering justice, regulating the police and civil affairs, controlling public instruction, exercising seignorial rights over the territorial possessions of the commonwealth, and conducting foreign affairs. But the convention has in its power also positive measures, of imposing taxes, determining the amount and application of the revenues, directing military affairs, and especially determining all important matters which concern trade and navigation. Nothing was officially known on March 15th of the year 1833 until a vote of the senate and convention, passed in January, 1831, decreed that the accounts should be annually before them. It appears from those which since have been presented that the ordinary receipts for 1833 amounted to 2,398,000 dollars, by the export of salt, and the extraordinary of 1,644,000 dollars, or a total of 684,529 dollars, of about 119,790 dts., and the ordinary expenditure amounted to 519,512, and the extraordinary to 187,478, making a total of 766,990 dollars, or about 123,720 dts. from which data, the excess of expenditure over income was computed at about 393,272 dts.

At the close of the next year, however, the deficit disappeared, and a surplus revenue of 35,000 dollars (about 6120 dts.) was passed over the credit of the ensuing year. The capital of the public debt in 1833 was stated to be 3,508,000 dollars (about 52,800 dts.), and the public debt for public service of 4,400,000 dollars (about 64,675 dts.). After deducting this interest, and the amount of the vote proposed for the annual reduction of the capital, the remaining expenses of the state were calculated at a future average of about 375,000 dollars, or about 53,620 dts. per year. The town is garrisoned by 455 men, which the state is bound to furnish to the army of the German Confederation; besides these, there is a militia composed of 2,000 men, excepting government servants, ecclesiastics, surgeons, police, &c., between the ages of 20 and 35; it consists of four battalions, mainly composed of about 2500 officers and privates, of whom those between the ages of 20 and 25 form the light infantry battalion. It is obligatory upon them to assemble once at least in the year, on the 9th of October, the anniversary of the battle of Leipzig.

Bremen carries on a very extensive trade, both with foreign parts and the interior of Germany. In 1832 its imports by sea amounted to 31,848,628 pounds of tobacco, 22,030,000 dollars of sugar and molasses, 42,000 pounds of coffee, about 29,000,000 pounds of sugar, and 30,000 hogsheads and pipes of wine, besides other articles; the whole value of these imports was estimated at 13,313,127 dollars, about 2,329,790 dts. The exports, valued at about 13,000,000 dollars annually, both by land and sea, consist principally of the productions of other countries, particularly the states of the interior of Germany, such as lead, copper, iron and iron ware, glass, grain, oak and fir timber, bark, potashes, drugs, hemp and flax, wool, rays, paper, tobacco, pipes, and other manufactured goods. The number of vessels which arrived in 1833 was 1116, of
which 120 were from Great Britain, and 123 from the United States; and in 1835, 1855, of which 120 were also from Great Britain. The immediate supervision over such matters as affect trade is vested in the 'college of elders,' who are the gerents for the commercial body only, but are no way connected with the government or legislature otherwise than as its members may be individual members of the body or the other. Bremen, as one of the Hanseatic towns, holds its municipal rights in common with Hamburg and Lübeck in two considerable properties in foreign countries—the 'Steel-yard' in London, and the 'Hanseatic House' in Antwerp.

The town of Bremen rose to greatness in the year 787 or 788, when Ethelbert Charlemagne made it the seat of a bishopric. Its incorporation with the archbishopric of Hamburg in 858 occasioned such violent contests between the chapters of the two towns, that it was finally determined, in 1293, that Bremen should be the seat of the archbishops, who greatly desired it, and the house of the rulers, who promoted its union with the league of the Hanse Towns; but notwithstanding the archbishop's repugnance, it was recognized as a free town of the holy Roman empire so early as the reign of the Emperor Otho I. The chapter was abolished when the archbishopric was converted into a secular duchy by the Swedes, but the freedom of the town was never fully established, owing to the opposition of the dukes of Brunswick, until the year 1736, when Bremen was separated from the Duchy of Holstein. In 1810 Napoleon incorporated it with the French empire, as one of his 'good towns' in the dep. of the Mouths of the Weser. In 1813 the battle of Leipzig restored its independence; and it was afterwards admitted a member of the German Confederation. It is one of the three Hanse Towns, together with Lübeck and Hamburg, by the Congress of Vienna.

The city of Bremen is situated on the Weser, which divides it into two unequal portions, the larger of which, the Altstadt or old town, is on the right, and the other, the Nordstadt or new town, on the left of the river. The old town has large suburbs, but the new town none; the latter was begun in the year 1624, is built with much regularity, and the streets are straight and broad. The old town, though not without some handsome streets and dwellings, has none of the character of a town, and still more gloomy by the height of the houses. These two quarters are also separated by an isle of the Weser, called the Werder, the lower part of which has been built upon and included within the limits of the town. The Weser bridge crosses the isle, and unites the two towns. The ramparts and bastions round the old town have been levelled and converted into delightful promenades, with six roads of entrance intersecting them. The quays which line both sides of the river afford a fine view of the town in all its magnificence, and a perfect uniformity of solidity and height with handsome mansions, villas, and gardens. The number of houses is about 5900, independently of granaries, warehouses, mills, manufactories, &c. which, if included, would make the number of buildings upwards of 7000; and the population, 45,418, and buildings and business 15,263. They are of the reformed religion, 1500 Roman Catholics, and 1000 Jews; the remainder are Lutherans. There are no open spaces of any magnitude in the town excepting the cathedral-yard (domhof), which as well as the market-place and the street in front of the main town gate, are the only open spaces. Several deserted churchyards have been left unoccupied in both towns for the purpose of affording freer circulation to the air, and instead of them three cemeteries have been made outside of the city. Among the most remarkable buildings in Bremen are the cathedral and the 1 Roman Catholic and 1 Protestant church. They are in the old town: the cathedral, a venerable structure in the Gothic style, was built in 1160: its length is 296 ft., breadth 124, and height 40 ft. Underneath it is the celebrated Basilica, the Roman Church of St. Peter (crypt or cryptic nave). The form from having been the spot where the lead for the roof was melted and prepared; in this cell are a number of bodies in a state of mummy-like preservation, which have lain here for upwards of 200 years. The church of St. Augustin has a steeple of handsome appearance, 324 ft. in height. The old Gothic town-hall, formerly the archiepiscopal palace, has undergone complete renovation, and the piazzas round it have been thrown open for public accommodation. Here is the former town-hall, built in 1495, and below it the famed Bremen ratsherrenraum (council's wine vault), one section of which, 'the Rose,' is said to contain old hock of as remote a vintage as the year 1624; while another, the 'Apostles' Cellar, contains, we are told, Hochheimer and Rudesheimer, made in the early part of the 18th century, and preserved in a disused winevaults, called the Twelve Apostles. Along one side of this vault are a number of small apartments, for the convenience of visitors who wish to relegate themselves; at the extremity of these apartments is the acoustic-room, a sort of whispering gallery. Beyond the鼠torium stands the Exchange, with its noble concert and ball-rooms; the Schüttig, in which the elders of the mercantile body hold their sittings; the Waterworks next the bridge, the great saloon of which produces revolutions in an hour, and throws up 120 water-jets into the air at every revolution; the Arsenal, Weighing-house, and Granaries; the Museum, erected in 1801, which contains a large library, collections in natural history, mechanics, the arts, &c. and lecture rooms; the gymnasiums—rooms; the two gymnasia, and the high-school; the school for trade and commerce; the central library; Dr. Ober's Observatory, from which he discovered the planets Pallas and Vesta; the Theatre, and a variety of public works in the town. It has nine gates of which three are of the new town and six in the old. The town is divided into 30 parochial and elementary schools in Bremen and its dependencies. The principal manufactures carried on as well without as within the city are those of woolens, leather, hats, and there are 276 beer-saloons, or beer sold in various kinds, of which 79 are in the city, 300 and 400 orphanages are maintained and educated; three almshouses for widows; and many other charitable establishments. 53*4 N., lat. 8° 47' E., long.

(T. W. Streit's Free Towns: Hassel's Free Hanse Town of Bremen; Dernbach's Manual; Stein's Travels; Official Documents, &c.)

BRENNUS, thelatinised form of the Celtic brennin, 'king.' Two individuals are known in history by this name.

1. The first was the hero of an early Roman legend, which relates to the migration of the Teutons into Italy and their march to Clusium and Rome. In the account given by Dio Chrys. (xvi. 113, &c.) of this singular invasion, the name of Brennus is not mentioned; in the narrative of Livy (v. 33, &c.), he figures as the 'regular Guellorum,' or the leader of the Teutons, and of the inhabitants called on the Romans for aid. He engaged with and defeated the Romans on the banks of the Allia, the name of which river they ever after held in detestation, (Vir. x. i. 717). The whole city was afterwards plundered and burnt, and has never since been inhabited, but only for the bravura of Manilius. At last, induced by famine and pestilence, the Romans agreed that the Gauls should receive 1000 lbs. of gold, on the condition that they would quit Rome and its territory altogether: the barbarian leader, however, refused. The Gold was given to the soldiery, and the time was expired without the capitulation, and ordered him to procure 2000 men, and 3000 were defeated; there was a total slaughter, and not a man survived to carry home the news of the defeat. The date of the taking of Rome, assigned by Niebuhr, is the 3rd year of the 29th B.C. 269 (see Hist. Rom., vol. ii. p. 509—567, English Translation).

2. A king of the Gauls, who (B.C. 279; Clinton, i. p. 237) made an irruption into Macedonia with a force of 150,000 and 10,000 horse. Proceeding into Greece, he attempted to plunder the temple at Delphi. He engaged in many battles, lost many thousand men and horses, but received many wounds. In despair and mortification, he called a council of war, and advised the Gauls to kill him and all the wounded, to burn the wagons, and, returning home with all speed, to choose Claudius (or Aecarius—see Paean) king. Soon, however, in a fit of intoxication,
on horseback were to pay a penny; those on foot a half-penny. Other passengers were exempt. The state of the bridge was long a cause of complaint, and various alterations were made to adapt it to the increasing number of passengers. In 1854 the present bridge was built, which is of stone, of one arch, 94 ft. between the parapets, 50 ft. wide in the water-way under the bridge, and 15 ft. high to the summit within the arch.

New Brentford church was rebuilt in 1764. The living is a curacy subordinate to Hanwell, and was at one time held by John Horne Tooke. There are seven daily schools, of which two are national, and three Sunday schools, in New Brentford; in Ealing, which includes Old Brentford, there are 17 daily schools, one of which is endowed, and two others are partly endowed; eight boarding schools, and three near Sunday schools. At Ealing there is a labour-school for the poorer classes. Some organic remains were dug up in a field near Brentford, of which an account is given in the 'Phil. Trans.' for 1813. The Grand Junction Canal comes into the Brent a little below Hanwell, and is thus carried to the Thames at Brentford.

In 1616, Edmund Ironside, having obliged the Danes to raise the siege of London, pursued them to Brentford, and defeated them with great slaughter. On the 14th of November, 1642, an action occurred between the royalist and parliamentary forces at Brentford, in which the latter were defeated. Patrick Ruthen, earl of Fortch, in Scotland, was, for his services in this action, created, by Charles I., earl of Brentford, a title which became extinct with him in 1661. In 1689 the title was revived by King William, who gave it to Duke Schomberg; Schomberg's son, who died in 1719, was the last earl of Brentford. Six Protestants suffered at the stake in the town of Brentford on 14th July, 1558. (Lysons' 'Environs of London; Report of Middlesex Magistrates on the Bridges of the County, 1826; Population and Education Returns'.

BRENTWOOD. [Essex.]

BRENT/FD/W, a family of ooloocephrous insects, belonging to the section Rhynochophora and sub-section Retic. Distinguishing characters:—body much elongated, tarsus with the tibiae bicoloured; antennae filiform, or in some with the terminal joint formed into a club; proboscis projecting horizontally, generally long; in the male longer than in the female; palpi minute.

The insects constituting this family are among the most remarkable of the beetle tribe, and are almost entirely confined to tropical climates: only one species has yet been discovered in Europe. But little is known of the habits of these insects, except that they are generally found crawling on trees, or under the bark, and sometimes on the leaves. The body being of various bright colours, the species is black, or brown, with red spots and markings.

The four principal genera of the brentides are as follows:—Brentus, Arthrides, Ulocerus, and Cylas. The species of Brentus is chiefly distinguished by having the antennae elongated, the tarsus yellowish, the tibiae slightly enlarged towards the apex, and the body linear.

Brentus Temminckii (Klug), one of the most remarkable species of the tribe, will give an idea of their general form it is found in Java, and is of a blackish colour varied with red markings, and has deeply-striated elytra.

Brentus Temminckii (Klug)
Ulcerous has the antenna nine-jointed, the last of which forms a club.

Cyclops has the antennae ten-jointed; the terminal joint forms an oval club; the thorax is indented in the middle, and the abdomen is of an oval form.

BRESCIA, THE PROVINCE OF, in the Lombardy. - The province of Brescia is situated to the north of the city of Brescia, the government of Milan, or Lombardy Proper, extends from 45° 14' to 46° 1' N. lat., and from 9° 50' to 10° 37' E. long. It is bounded N. by the Tyrol and the day Val Camonica in the province of Bergamo, from which it is divided by a contract of the Roman Alps which runs S. between the Oglio and the Chiese, E. by the lake of Garda, which divides it from the Veronese, S. by the prov. of Mantua, and S.W. by the prov. of Cremona, and W. by the prov. of Bergamo. The river Oglio and the lake of Iseo, 19 m. in length, through which the Oglio passes, mark the boundary between Brescia and Bergamo, and also the Chiese, Cremona, and Cremona. The length of the prov is 64 m. from N. to S., and its greatest breadth from the lake of Garda to the river Oglio is about 33 m. The area is about 1300 sq. m., and the pop. 322,000. (Bollettino Statistico di Milano, 1833.)

The territory with regard to its surface and the nature of the soil may be divided into three parts: 1. the valleys and mountains N. of the town of Brescia, which are rugged and cold in winter, and little productive. 2. the W. coast of the lake of Garda called Riviera di Salò, which has a mild climate, and is inhabited by a considerable number of people. 3. the S. part of the prov., which forms part of the great plain of Lombardy, and produces corn, rice, Indian corn, flax, grass, and a great quantity of mulberry-trees. Besides the Oglio, which skirts the province of Brescia to the E., the river Iseo flows through the prov. from N. to S., and drains two branches of the Oglio into the N. division. The Mella, which has its source in the mountains 22 m. N. of Brescia, flows through the Val Trompia, then passes close to town of Brescia and W. of it, and after a course of about 35 m. enters the Oglio near the city of Verona. The Chiase has its source at the N. extremity of the prov. on the borders of the Tyrol; it then enters the lake of Iseo, which is about 8 m. long and from one to two in breadth; issuing from its S. extremity, it flows through the valley called Vansone, or Vanozzo, and passes near Montechiaro, marks the boundary between the provinces of Brescia and Mantua for about 10 m., and after wards leaving the territory of Brescia divides the provinces of Mantua and Cremona until it enters the Oglio below Come, where it divides into two branches, one called the Chiase, the other the Oglio. To the prov. of Brescia, mostly for the purpose of irrigation, which is carried on to a great extent, and also for turning mills and other machinery. The prov. of Brescia is crossed from W. to E. by the high road from Milan to Peschiera and Verona, from which branches branch S. to Crema, Cremona, and Mantua. To the N. a road leads by Salò and the W. coast of the lake of Garda to Riva and Roveredo in the Tyrol, and another mountain-road leads into Valtellina by Endo in the Val Camonica. A steam boat plies between Riva and Lambrugo, at two opposite extremities of the lake of Garda.

The chief productions of the prov. of Brescia are, silk, flax, cheese, and iron. Corn is produced enough for the consumption, the peasant living upon Indian corn. In the N. valleys numerous flocks of sheep are reared, the wool of which is used for the home manufacture, especially of blankets which are made in the district of Besano. The iron mines of Collio Bovegno and Pezze in the Val Trompia, with the foundries and forges in which the iron is wrought, are an important source of profit and employment. The manufacture of the silk industry is entirely self-supporting. Brescia has been long celebrated, employ as several hundred workmen. In the Riviera of Salò they spin a great quantity of flax, and have also many paper-mills. In the plains S. of Brescia silk is the great branch of industry, the manufacture of the silk industry being entirely self-supporting. The account of the silk-stuffs, but the greatest quantity of the silk is spun before it is exported, and is valued at nine millions of Austrian livres yearly, about 300,000 Sterling, sterling. There are also manufactories of cottons and leather. Marble quarries are.

The prov. of Brescia is divided into 17 districts, which contain 235 communes. (Sertorius, Saggio Statistico, Vienna, 1833.) The towns, besides Brescia are: Chiaro, 8000 inh.; Montechiaro, 5000; Lonato, 6000; Desenzano, 3600; Sall, 2600; Prato Veterno, 4400; there are smaller towns of between 2000 and 3000 each, such as Manerbio, Ghedi, Len, Carpenedolo, Calvisano, Verola, Novo, Orzinovi, Quinino, Rovato, Palazzolo, Iseo, Gardone, Gavardo, Tosciano, &c., and about 200 villages. On the W. coast of the lake of Iseo the fortress of Rocca d'Anfo built on a rock, is one of the stations of the Austrian artillery.

The prov. is administered by a delegate, each district by a commissary, and each commune by a municipal officer called Podesta. For the military there is a commandant at Brescia. For judicial purposes there are civil, criminal, and mercantile courts, from which there is an appeal to the upper courts at Milan. The ecclesiastical jurisdiction is vested in the bishop of Brescia. The secondary instruction is afforded by the lyceum and the gymnasium at Brescia, the gymnasium of Desenzano and Salò, the diocesan gymnasium and seminary for clerical students, besides a college for boarders and several private establishments authorised by the government. Female education is given by the Ursuline nuns at Brescia, and by the nuns of St. Francis de Sales at Salò, and by school for boys and girls, being more than one of each for every commune. The number of pupils was in 1833 17,581 boys, and 11,797 girls, being the highest number in proportion to the pop. among all the Lombard provs. in 1833.

The charitable institutions in the prov. are: 1. 14 hospitals for the sick, the insane, foundlings, &c., with a revenue altogether of about 15,300L. 2. Orphan asylums, refuge for the destitute, for invalids, and old people; revenue 41,500L. 3. Eleemosynary, or works of charity, for the poor; revenue 41,500L. 4. A house of industry, or works of charity, for the poor; revenue 700L., and with generally about 240 inmates, one half of whom are unable to work, and are kept separate from the others. Houses of industry have been established in each of the principal towns of Lombardy, in consequence of the law of 1832, which forbids the forcing of the poor to go to the charitable institutions, and it seems to be very indifferently administered. The government however has turned its attention to this subject as well as to that of the administration of charities in general, and a new plan of reform is expected. (Bollettino Statistico, 1833.)

The provs. of Brescia and Verona, and also the Venetian, assist on pledges at a small interest, and many others which lend a certain quantity of corn to poor villagers and labourers, to be returned with interest in kind. The interest is about one-sixth of the capital yearly. 6. Foundations for poor students; income 865L.

The people of the prov. of Brescia are a fine healthy race, especially in the N. districts; they furnished the finest men to the army of the late kingdom of Italy under Napoleon. They are spirited and quick, and had once the character of being very quarrelsome; under the rule of the Austrian government, the inhabitants of the prov. of Brescia was once a part of the territory of N. Italy in which the murders were committed. It must be observed however that the provinces called d'Oltà Mincio, i.e. Bergamo, Brescia, and Crema, being later acquisitions of Venice, were the worst administered, especially with regard to the judiciary system. The feudal system interfered with the administration of justice. In the prov. of Brescia alone there were 20 feudal towns or villages. The old provincies of the Republic, such as Padua, Vicenza, Verona, &c. were under a more equitable system. Things have since been changed for the better in the provs. of Brescia and Verona, owing to more equal laws, a good police, and a better education. Instead of the former deadly feuds between rival families, says a contemporary, the only rivalry now existing between country proprietors is about who can make the best wine and raise the best cattle as short as possible of their time on their estates, sporting, fishing, and hospitably entertaining their friends. (Peschetti, Vita di Ugo Foscolo.) Upon the whole the prov. of Brescia is one of the finest in Lombardy.
it was ravaged by the Goths, the Huns, and lastly was taken by the Longobards, and became one of the principal towns of their kingdom. Desiderius, their last king, was a native of Brescia, where he founded the monastery of St. Salvatore, called the Desiderius. His daughter Anspurga was the first Abbess. Across, richly ornamented with cameos, representing mythological subjects, which was given by Desiderius to his daughter, is preserved in the library. After the fall of the Longobards, Brescia passed under the control of the Saxons, and Guielminus, who gave it municipal privileges and franchises, by which it governed itself for nearly three hundred years under its own consuls. It joined the Lombard League against Frederic Barbarossa, and afterwards resisted the attacks of Robert II. Being in the hands of the Guelfs and Guibelines, it was taken successively by Ecclino the tyrant of Padua, by the Pallavicini of Piacenza, the Torriani of Milan, the Scaligeri of Verona, and other feudal lords, until it submitted to the Visconti, of whom yoke the citizens growing tired gave themselves up to the Venetians in 1426. The league of Cambrai took it from Venice in 1509, when it passed under the French, from whom having revolted in 1512, it was retaken by storm by Gaston de Foix, who gave it up to all the horrors of pillage and massacre. It was on this occasion that Bayard was severely wounded. Soon after, by the retreat of the French, Venice recovered all its possessions, and Brescia among the rest. From that time Brescia remained under the republic till 1797, when a party of nobles and citizens, dissatisfied with the Senate, overthrown by a French army, seized Brescia of the Milanese, revolted against Venice. Bonaparte annexed Brescia with Bergamo to the Cisalpine republic. By the peace of 1814 Brescia, with the rest of Lombardy, passed under the dominion of Austria. (In addition to the authorities cited, see Nuovissima guida per la città di Brescia, by F. Brognoli, Brescia, 1826.)

BRESLAU, one of the 25 government circles (regierungs-bezirke) of the kingdom of Prussia, includes the central districts of the prov. of Silesia, among which was the city, where Dr. Labus, physician and poet, was born, and where lies a large painting in the town palace represents Beccarelli's condemnation. For a full account of the learned men of Brescia, see Cozzando Liberaria Bresciana.

The Ateneo, or Academy of Sciences and Belle Lette of Brescia, publishes yearly its 'Commentari,' or Memoirs. A weekly journal is published at Brescia, 'Giornale della provincia Bresciana.' There is a handsome theatre, a cinema or assembly-rooms, a large building outside of the town for the annual fair, and a new casamento or cemetery, begun in 1843. In both the parishes there are new come about the other against the walls, after the manner of the anticent columbaria. Brixia was the chief town of the Cenomani, a Gallic tribe said to have emigrated into Italy with Belbessus, and to have settled along the Oglio. The ancient name of the city was Brixia, and the city became the capital of the stone wall. The Roman Brixia was conquered by the Romans under Cornelius Cæcillus, about 200 years a.c., and Brixia became a Roman colony and afterwards a municipium. After the fall of the empire

BRE, or BRIAC, (the Roman Brixia) the capital of the prov. of Brescia, is situated in a plain between the river Mella and the naviglio or canal which comes out of the river Chiuse, and joins the Oglio in 45° 22' N. lat. and 16° 13' E. long. The hills from the N. of Brescia are surrounded by walls, about four m. in circuit, and has a castle on a hill which is inclosed within the walls in the N.E. quarter of the town. The pop., in 1833, was 34,000 (Serriorti Saggio Statistico). It is a bustling, lively, well-built t., a busy mercantile city, and resides the seat of the bishop of the Diocese, and governor of the province. Brescia has many fine churches with numerous paintings by the great masters, principally of the Venetian school. The rotunda of the old duomo or cathedral is a structure of the Longobard princes of the 8th century. The new cathedral is a splendid building as well as the churches of Sta. Maria del Miracoli, Sta. Maria delle Grazie, del Carmine, La Pace, Sta. Afra, S. Petro, &c. They abound in paintings by native artists, among others by Moretto, a delightful painter, whose works alone, he says, are worth a journey to Brescia to see. Among the palaces, the town-house called la Loggia, the episcopal palace, and the palaces Martinengo, Avogadri, Legchi, Gambara, Fanaroli, &c., deserve visiting. Of the galleries of paintings those of Count Legchi and Count Toselli are the principal. The public library, founded by the learned Cardinal Querni, Bishop of Brescia, in the 18th century, has 25,000 volumes. Querni's voluminous correspondence with D'Aguesseau, Fleury, Montfaucun, Dom Calmet, Voltaire, &c., is preserved in the library. The rich city palace of the Carrara family has lately been described in the 'Musem Mazucchellianum,' 2 vols. fol. Brescia, next to Rome, has most fountains of any town in Italy. There are 72 public fountains in the streets and squares, besides some hundreds of private ones. The water comes from springs near the neighboring towns of the Adige, and the Po. There are many ancient inscriptions have been found at Brescia, and of late years the remains of a handsome temple have been excavated. The temple appears to have been raised by Vespasian to commemorate his victory over the troops of Vitellius near Crassum in Syria (71). The temple was of marble, of three stories, and with 17 columns on each side; and among the rest a very beautiful bronze statue of Victory have been found. (Antichi monumenti scoperti in Brescia illustrati e delineati con tavole in rame, Brescia, 1829.)

The climate of Brescia is healthy, but subject to sudden storms. Provisions of every kind are abundant, and fish is brought from the lakes of Garda and Iseo. Science and literature have been cultivated at Brescia for ages past. Among the men of learning it has produced, we may mention: 1. The philosopher and theologian, the martyr, Bartaghi, and the learned ladies, Veronica Gambara and Laura Ferrera, in the 16th century; the naturalist Father Terzi Lana, Mazucchelli, Gagliardi, Corniani, in the 18th, and in the present century the poet Areti, the archæologist Dr. Labus, and the physician Dr. Ungaretti. Dr. Labus, father of the learned Moretto, Vincenzo called il Bresciano, and others were natives of Brescia. The priest Giuseppe Beccarelli, who had been for more than twenty years at the head of a large establishment of education at Brescia, being accused of immorality and heresy, was condemned, in 1710, by the Inquisition to the galleys, which penalty the Senate of Venice commuted into perpetual imprisonment, in which he died. This was the last act of the Inquisition of Brescia. A copy of Beccarelli's interrogatory and other inedited documents concerning the proceedings is in the possession of the prov. of Silesia, and is published by Dr. Labus, who was a lawyer in the city of Brescia. The large painting in the town palace represents Beccarelli's condemnation. For a full account of the learned men of Brescia, see Cozzando Liberaria Bresciana.

The Ateneo, or Academy of Sciences and Belle Lette of Brescia, publishes yearly its 'Commentari,' or Memoirs. A weekly journal is published at Brescia, 'Giornale della provincia Bresciana.' There is a handsome theatre, a cinema or assembly-rooms, a large building outside of the town for the annual fair, and a new casamento or cemetery, begun in 1843. In both the parishes there are new come about the other against the walls, after the manner of the antient columbaria. Brixia was the chief town of the Cenomani, a Gallic tribe said to have emigrated into Italy with Belbessus, and to have settled along the Oglio. The ancient name of the city was Brixia, and the city became the capital of the stone wall. The Roman Brixia was conquered by the Romans under Cornelius Cæcillus, about 200 years a.c., and Brixia became a Roman colony and afterwards a municipium. After the fall of the empire
bridges, are a continuation of the same plan, completing the whole, though denominated the 'Outer Town,' in contradiction to the first-mentioned, which is called the 'New Town.' The wards of this town are divided by combinations of the width of the streets and the broad fronts and handsome elevation of the houses, gives the town a cheerful appearance; which is in contrast with the massive and more sombre aspect of the churches and public buildings. The same appears to uprightness and stability of the town having been recently rebuilt: they were burnt in order to clear the defences of the town when it was besieged in 1806. There are three of the suburbs on the same side of the Oder as the New Town, namely, the 'Nicolaï' to the W., the 'Schweidnitz' to the E., and 'Oblau' to the E., but the fortifications which divided them from the New Town were razed in 1813, and a broad ditch is now interposed between them. On the N. side of Breslau lie four other suburbs, separated from it by the Oder, namely, the 'San- denstein' and 'Dom,' or cathedral suburb, outside of the Sand Gate, and the 'Oder' and 'Bürgerwerder;' the whole of them are built on two islands formed by arms of the Oder, and connected with the New Town by one large bridge across that riv, and eight smaller ones across its arms. The ditch or canal which divides the New Town from the Nicolaï suburb, is traversed by the 'King's Bridge,' which is made of cast iron, in weight about 140 tons, and was opened on the 16th of October, 1822: at each end of it is a square, that on the Nicolaï side opening upon a handsome street and fine buildings, while the other, leading to the Sand and Schweidnitz suburbs have also handsome squares attached to them. The greater part of the town is encircled by an agreeable promenade, ornamented with trees and shrubs, and bounded by the banks of the Oder. In the suburbs, in the three or four slopes raised upon three of the old bastions. Among the numerous improvements made in Breslau of late years, is the erection of the Exchange buildings on the 'Salzring,' which is now become one of the most agreeable resorts in the town, and has changed its name into that of 'Salz Square.' A noble monument of bronze was erected here on the 26th of August, 1827, in commemoration of Büchler's victory on the Katzbach and of the Prussian army which supported him. The state of Büchler is raised upon a pedestal of gray granite, with a relief, representing the general departing from the fields, engraving the name 'War God's aid, for our King and Country.' On one of the sides of the substructure on which the pedestal rests is inscribed 'The people of Silesia to Field-Marshall Büchler and the Army.' The statue and its substructure are 26 ft. in height, and was erected in 1816. In 1816, Breslau contains 32 churches and 1 synagogue. The cathedral church, said to have been built between the years 1148 and 1170, is highly decorated in the interior, and contains 17 side chapels. The Church of the Holy Cross, erected by Hohenzollern, the Church of the Holy Trinity, and the Church of the Holy Cross, and stands upon a subterranean church of precisely the same shape and dimensions, which the same prince, whose remains were deposited in the upper church, constructed in honour of St. Bartholomew. Among the finest churches are also the church of St. Mary, on the Sand Island, begun in 1330; St. Dorothea's, the loveliest church in Breslau, founded by the Emperor Charles IV. in 1350; and the chief Protestant church, called St. Elizabeth's, in which the first sermon preached by a Protestant minister in this town was held on the 23rd of April, 1525. The present steeple of this last church was erected in 1534, and is about 330 ft. in height. The royal or public buildings of the town are about 240 in number. The 'guildhall' was probably erected in the early part of the eighteenth century, and is noted for its apartment called the 'princes' hall,' where the banquets and feasts formerly held their sittings. It is situated on the Parade, the finest square in Breslau, nearly in the centre of which is the city weighing-house, a building in shape like a tower, erected in 1791. Among the other public buildings is the town hall, and those of Frederic the Great, at the close of the Seven-year's war; the courts of justice; the public library in the Sand suburb; the Roman Catholic gymnasion; the episcopal palace near the cathedral; the arsenal; the burg, once an imperial palace, and that of the college of the bishops and property of the university; and the handsome range of buildings called the 'university building.' The university was founded by Leopold I., in 1702, for the two faculties of divinity and philosophy. Two more, for law and medicine, were added in 1811, when the university of Frankfort on the Oder was incorporated with it. The library contains 166,000 volumes, of which 11,000 are in the University, 3,700 paintings, the university has a botanical garden, an observatory, museums of anatomy, natural history, and antiquities, a clinical hospital, &c. Between the year 1826 and the present time, the number of students has increased from 2,728 to 5,234. The gymnasion here, besides a superior kind of civic school and a seminary for teachers; the Catholics, a royal gymnasion, a school for teachers, the 'Alumnat,' which is an establishment for maintaining and educating candidates for the church, and ten other schools. The Jews have a good school, founded here in 1790, and another of an inferior kind. Breslau likewise possesses a provincial school of arts, where mechanics are taught drawing and modelling; a school of architecture; an obstetric institution; an asylum for the support and education of officers' daughters; a school for the working class (Gewerbeschule); a refuge and school for the deaf and dumb, and another for the blind; a Sunday school; 30 elementary schools; a Bible society, with three auxiliary establishments in the circle; a Silesian society for promoting objects of public usefulness (Verbildlicher Culture), founded in 1803, and divided into sections for antiquities and art, history, medicine, natural history and philosophy, rural and public economy, and pedagogic; a society for Silesian history and antiquities; 14 public libraries; 9 libraries and societies for the promotion of works of art; several hospitals and infirmaries; and an establishment for faithful servants, opened in 1820; and a number of other charitable institutions. The value of the property held for benevolent purposes is little less than 300,000l., and the number of voluntary donations is upwards of 16,000l. a year. The house for the reception of the indigent infirm, and the general management of the poor throughout the circle, are under the direction of a board consisting of members chosen out of the magistracy, clergy, and citizens at large. Each of the 49 minor circles is under the control of five or six assessors, besides a director and adjutant, in respect of all matters connected with the poor. The town is the seat of an important mint, and has a royal office for mining productions, a brewery, a glass factory, and other establishments incidental to its character as the centre of provincial government. There is a theatre and opera-house, and there are several musical societies, public and private. The increase in the pop. of Breslau may be seen from the subsequent statistics.-14,939, in 1769; 21,131, in 1793; 38,752, in 1822, 74,922; in 1829, 84,504; and in 1834, 91,615, an increase of 4012 as compared with the year 1832. Of these 91,615, the number of Protestants was 61,330; Catholics, 25,192; Jews, 5086; and Greeks, 5. In the same year the number of artisans, with less than 30. Each of the 49 minor circles which were more numerous than usual, to 3238; and the marriage rate to 901. At that date also Breslau had 37 places for public worship; 278 public buildings; 3902 private houses; 279 mills, warehouses, and manufactories; and 1771 stables, barns, and distilleries. There are manufactures of all kinds at Breslau, particularly of gloves, plate and jewellery, silk, woollens, cotton, linens, and stockings; and a very extensive trade exists on the Silesian products and fabrics, as well as foreign goods, with leading commerce with other parts of Prusia, and with Russia, &c., to which linen and cotton goods are exported. The annual value of this trade is estimated at between 4,000,000l. and 5,000,000l. sterling. The fair, of which there are six in the course of the year, are the largest, with respect to the sale of wools, in the Prussian dominions; the fairs for wool however, are the most distinguished from the others, and are kept in the early part of June and October. In the first-mentioned month of the year 1827, the quantity weighed was 63,371 cwt. There is a regular communications by water. The Oder represents the boundaries of Breslau and Hamburg, conducted by an association of 100 owners and captains of vessels: the passage is never more than 32 days. By the treaty of Breslau, concluded on the 11th of June 1742, the town, together with the whole of Silesia, was ceded to Austria. In 1744 the town suffered its first bombardments, which drew upon itself the siege of 1747. 1757, 1760, and 1793. It was demolished in 1813 and 1814. It was the birth-place of C. von Wolf, the mathematician, who died in 1754, and Garve, who died in 1798. 51o 44' N. lat., 17o 25' E. long.
BRESSE, a considerable district included in the former government of Bourgogne in France, from the main part of which it is separated by different localities, has been long subjected to the treaty of the N. by the duchy of Bourgogne and by the Franche Comté, on the E. by the district of Bugey, on the S. by the government of Dauphiné, and on the W. by the Beaujolais and Lyonnais, and by the principality of Dombes, which was in the hands of Bugey. Bresse is now distinguished by vast naked plains, very productive in grain of all kinds: there are also pools abounding in fish, and much poultry is reared. Bourg, the chief town, was sometimes distinguished from other places of the same name by the designation of Bourg en Bresse. Pop. in 1832, 7626 for the town, 896 for the commune. (Chalais ou Bourg en Bresse is now divided into parts, of which one is in the dep. of Ain. The chief rivers are the Ain, Saône, and Rhône. Under the Romans Bresse was inhabited by the Ambarri, who were kinsmen of the Aedu, the predominant people of this part of Gaul. In the dominions of the province of Gaul under the later Roman emperors, Bresse was included in Viennois. It formed part of the kingdom of the Burgundians, and was included in that subsequent kingdom of Bourgogne, the sovereigns of which ascended the imperial throne. The feeble authority which these princes asserted in this extreme part of their dominion enabled the nobles of the district to acquire considerable power: the chief of these nobles were the lords of Baugé, Coligny, Thoire, Villars, &c. Bresse had subsequently its states or local government. In 1790 it was divided into parts, some of which became partly into the hands of the dukes of Savoy, who ceded it to France by the treaty of 1601, together with Bugey, in exchange for the marquisate of Saluzzo, &c.

The chief towns of Bresse, with their pop., in 1832, were: Bresse, dep. of Saône-et-Loire, pop. 888 for the whole town, 297 for the whole comm.; Pont de Vaux, 2539 for the town, 3189 for the whole comm.; Châtillon (according to the Dict. Univ. de la France, Paris, 1804). 1719; Pont du Desse, or Pont de Veyle (according to the same authority), 1364; and Baugé, or Bagé (according to the same authority), 810.

The designation Bresse was given also to a 'lièvetsance-générale' of the government of Bourgogne, which seems to have included not only Bresse proper, but also Bugey, Valromey, &c. (Map by W. and D. Lizars, Map for the Diffusion of Useful Knowledge, the principality of Dombes, which other maps assign to the Lyonnais. The country was in the archdiocese of Lyon.

The name Bresse comes from the name of a forest (Saltus Bresiarum). The roots of this word were also preserved in the greater part of this country. (Encyc. Méthod.)

BRESSUIRE, a small town in the dep. of Deyx. Serres in France, deserving notice only from its rank of chief place of an arrondissement, or sub-prefecture. It is on a small stream with a wooden bridge, which falls into the Loire; and is in 46° 50' N. lat. and 4° 29' W. long. In the war of La Vendée, which ensued upon the French revolution, Bressuire was almost entirely destroyed. Before that war it had contained eighty manufacturers of woven fabrics, besides dyers and fullers; after the war only one house and the church remained standing. Since that period it has revived: sappers and cotton goods were made, and the population rose to 1847. (Dict. Univ. de la France, Paris, 1804.) Woolens and linens are made there at present. The name is said to be derived from the great stone bridge.

BREST, a town in the dep. of Finistère, in France, the capital of an arrondissement, and well known as one of the great naval stations of that kingdom. It lies on the N. side of a deep bay, called the Road of Brest, land-locked, and entered by a narrow channel called le Goulet. It is about 310 m. in a straight line W. by S. of Paris, according to Brue's map of France, and 362 m. by the road through Dreux, ALENÇON, Mayenne, Laval, and Rennes. By passing however from Mayenne to Rennes through Fougerès instead of Dreux, the distance is considerably reduced, and can be saved. Brest is in 46° 24' N. lat. and 4° 28' W. long.

D'Anville would identify Brest with the Brivates Portus (Brovitis Portus) of the geographer Ptolomy, who has however, if D'Anville's hypothesis be correct, very much more credibility. It is said that the town was the capital of the Liger, Aiyap (Loire), and the Herius, Epyc (Vilaine).

D'Anville also considers that this place is mentioned in the Theodosian Table under the name of Gesocritre, or, as he would correct it, Gesocbroctre or brivate; a name which in its Celtic signification, 'great harbour or roadstead,' is sufficiently appropriate to Brest. However this may be, there is no desire to place of any great importance in the Roman time; and subsequently it appears to have sunk into complete obscurity.

In the war for the possession of the Duchy of Bretagne, between Charles de Blois and Jean de Montfort, in the 14th century, the castle of Brest is mentioned, and the troops for the defence of Besançon were sent to the assistance of strength and importance in a military point of view. Between 1341 and 1346 it was taken by the partisans of de Montfort from those of de Blois; and in 1373 it was defended by an Englishman, Robert Knolles, against the attacks of the French Gendarmes. The English mark the fort of Brest, having engaged in the war as the auxiliaries of de Montfort and de Blois respectively. In 1386, de Montfort having defeated his competitor and become Duke of Bretagne, besieged Brest, held by his former ally the English (with whom he had, as we have seen, broken), as security for a debt; but the attack failed, and the town was not restored till 1395, when it was given up on payment of the money for which it was held in pledge. Early in the 15th century the English were repulsed in an attempt to force an entrance into Brest harbour in order to burn some vessels that were lying there. In the war of the League, in the latter part of the 16th century, Brest was again the object of contest: it was successfully defended by de Sourdoce, in the interest of Henry IV., against an attack of the troops of the League; and in 1586 it was once more attacked and captured by them by an overwhelming armament of Spanish ships of war.

It was not however till 1631 that the real greatness of Brest commenced: hitherto it had been a mere fortress. Cardinal Richelieu, perceiving its capability for an important station, and having the means of erecting the fortifications to be erected. The favour of Louis XIV. further augmented the growth of the place: that monarch established the magnificent arsenal. In 1694 Brest was attacked by a combined fleet of English and Dutch vessels, from which a body of troops was landed in the hope of carrying the place by a coup-de-main. But the fleet was driven off the coast by a storm, and the troops, deprived of the protection of the fleet, were for the most part cut in pieces.

General Tollesmache, who commanded the English land forces, was mortally wounded.

The town of Brest is of triangular form; the sides of the triangle facing the W., N.E. and S.E., respectively. The S.E. side of the triangle lies along the roadstead or bay. The port is formed by the river Penfeld, which, entering the bay near the eastern angle of the town, is divided into the roadstead with a winding course, dividing it into two parts, that on the left bank of the stream being Brest, strictly so called, while that on the right bank is known as the suburb or quarter of Recouvrance. In Brest, just at the point where this stream falls into the sea, is the house, known as the Zouave, which is the means of commanding the entrance to the port, is the castle, the importance of which in the middle ages is evident from the particulars contained in the above brief historical sketch, and the strength of which is very much owing to its situation.

The whole town is strongly fortified. The site of the place is very uneven; and hence has arisen the division of it into the upper and lower towns. So steep is the declivity, that the communication is made in some parts by means of steps, which in wet or frosty weather are rather dangerous; these steps are of stone, and form the subject of the fifth story of others. The streets in the upper town are winding as well as steep, and improvements there proceed but slowly; in the lower town they are carried on with more rapidity. In Recouvrance modern houses are rapidly superseding the Gothic edifices of the same town. Brest had, before the revolution, two par. churches, St. Louis in Brest, and St. Sauveur in Recouvrance. In the most antient time Brest seems to have been included in the neighbouring par. of Lambeselle, which is just to the N. of the town, but not included in the ecclesiastical division, and submitted to constant changes. The Jesuits had at one time a house here with a fine garden. They conducted a seminary for training chaplains for the king's ships; but before the revolution they had been expelled; and in a map now before us (Paris, 1717) their place is occupied by a hospice of the same name. There were also a considerable establishment of the reformed or barefooted Carmelite monks, a Capuchin monastery, and several other religious establishments.

Besides the arsenal, established as already noticed by
Louis XIV, there are handsome quays, slips for building, and extensive storehouses, rope-walks, and barracks; also a building for the reception of the convicts who are sentenced to the galleys, called Le Bagné. This last-mentioned building is on the summit of a hill, and large enough for 4000 convicts. The various establishments for the navy occupy nearly the whole of the port; and the commerce of Brest is trifling compared with what it might become. It has been projected to form a harbour for merchant vessels, by cutting a canal from the naval port to the road so as to make the site of the castle an island. It is considered that this project, if executed, would supply a great desideratum; viz., a considerable mercantile harbour between Nantes and Le Havre. Brest has several establishments for the promotion of knowledge, a botanical garden, a marine library, an observatory, and a museum of natural history. The pop. in 1832 was 29,800.

The bay or road of Brest is perhaps one of the finest natural harbours in the world. The passage, Le Goulet, by which it is entered, is less than a mile in width, but within there is room for 500 vessels of the line. The road may be considered as the estuary of several small streams which flow into it, none of which however, except the riv. of Châteaulin, which forms part of the system of inland navigation connecting Brest with Nantes. There are two main arms or branches of the bay, each of which penetrates several miles inland; and several smaller inlets. Brest is the chief town of an arrondissement, containing in 1832 156,010 inhabitants.

Bretagne, or according to the English manner of writing it, BRITANNY, one of the most important of the prov. into which France was divided before the revolution, is at present divided into the five dep. of Ile et Vilaine, Loire-Inférieure, Côtes du Nord, Morbihan, and Finistère.

Bretagne is situated at the extremity of that part of France which, jutting out into the sea, forms with the Spanish coast the Bay of Biscay. On the N. and W. and S.W. sides it is washed by the sea, and on the E. side, which is towards the land, it is bounded by Normandie, Maine, Anjou, and Poitou. The length of the prov. E. and W., from opposite the Isle of Ouessant or Ushant to the neighbourhood of Fougeres is about 170 m.; the greatest breadth N. and S. from St. Malo to the neighbourhood of Mâcheaul.co.s of the Loire is about 123 to 130 m. The greatest dimension that can be taken is from N.W. near Brest to S.E. 195 m. Bretagne is usually divided into the Haute or Upper Bretagne, and the Basse or Lower Bretagne. It is traversed from E. to W. by the chain of the Méné mountains, which entering the prov. from Maine run towards the sea, before reaching which they part into two branches and enclose the road of Brest. The northern branch, called the Arrê mountains, terminates in the headland opposite Ouessant; the southern branch, the Black mountains, terminates at the Bay of Douarnenez. The highest point of this range of the Méné mountains is not more than 1300 ft. The coast of Bretagne is of great length, first extending westward from the mouth of the little riv. Coufaron (which separates this province from Normandie) to the headlands opposite the Isle of Ouessant; and then running S.E. to the neighbourhood of the Isles of Boui and Noirmoutier, which belong to Poitou. The N. coast runs parallel to and not very far from the northern slope of the Ménez mountains. This coast is very irregular in its form, being indented by a succession of bays, those of Cancale, St. Malo, St. Brieuc, &c., between which the land juts out into headlands. This coast is skirted by a number of small islands and rocks, as the Chausey Island and Les Minguieres, which are some distance from the coast towards the Isle of Jersey; the Isles of Brehat, les Sept Iles (the Seven Isles), les Molheins, and the Isle of Bat. At the western extremity of Bretagne we have the two deep bays, the Brest Road and the Bay of Douarnenez; and off the coast are the Isle of Ouessant (Ushant) and several smaller ones, as Balance, Benniguet, and the Isle of Saint or Sein. The S.W. coast has an outline as irregular as the N. coast. The bays of Audierne, Benodet, and Forest, with the points or headlands of Raz, Penmarch, and Tevennec, succeed one another; these are followed after an interval of many miles marked only by the outfall of the riv. Blavet, forming the harbours of l'Orient and Port Louis, by the pen. of Quiberon, by the bay of Morbihan, and by the embouchures of the Vilaine and the Loire. The islands lying among them are included in Groix and Belle-Ile, with the several smaller isles of Glenan, Houat, Hédict, and Dunez. The rivers of Bretagne rise for the most part in the Ménez mountains. From the proximity of the mountains to the northern shore the streams which flow from them on that side have too short a course to become of magnitude. The principal streams, enumerating them from E. to W., are the Coufaron, which rises near Fougères, and after separating Bretagne from Normandie, flows into the sea below Pornichon; the Rance, which flows past Dinan, where it becomes navigable, and enters the sea at St. Malo; the Trieux, and the Guer. The space included between the Arrê mountains and the Black mountains forms the basin of the Aulne, which passing Châteaulin (where it becomes navigable), and assuming from it the name of the Châteaulin, falls into the road of Brest. The rivers which flow from the southern declivity of the Ménez are for the most part larger than those above named. The Odet indeed is small, but it is navigable up to Quimper; the Blavet, a longer river, is navigable up to Pontorson, which is 35 m. above its outfall. The Oust, after receiving several tributary streams, falls into the Vilaine, which, though rising just within the boundary of Maine, has the greater part of its course in Bretagne. It flows W. to Rennes, where it becomes navigable, and then turning to the S.E. passes Redon and Roche Bernard, and falls into the sea a little below the latter. Its whole length may be estimated at 110 m., and the length of its navigation at 70 m. The southern part of
Bretagne is watered by the Loire and by some of its tributaries, of which the Sèvre Nantaise and the Erdre, small streams but navigable for a short distance, are all that deserve mention. Besides the facilities for navigation which these rivers afford, Bretagne has one can. (that of the Ille and Vilaine) into which domestic traffic runs, and a second which runs nearly parallel to the coast, but several m. inland, from Nantes to Châteaulin, whence the communication is continued by the riv. Aurée or Châteaulin to the road of Brest. There is one lake, that of Grand-Lieu, S.W. of Nantes. (R. of France, by the Society for the Diffusion of Useful Knowledge.)

The soil varies much. In some parts, especially on the coast, it is very fertile, but there are some vast sandhills or heaths in the interior. The produce of corn, hemp, and flax is considerable. The Sèvre Nantaise is navigable for corn-raising than can be consumed in the province, and a considerable quantity is exported. A little wine is grown, chiefly about Nantes; the common drink of the people is cider. When the quantity of wine is greater than is thus consumed, it is converted into brandy. There is much pasture land, and a considerable number of cattle are raised. The butter, especially that made in the neighbourhood of Rennes, is in good repute. The mineral riches of this province consist of an abundance of lead, also of iron, tin, antimony, and some silver; marble and coal. For further particulars of the produce of this province, the reader is referred to the several departments into which it is now divided.

The pop. of the five dept. into which Bretagne is divided was in 1832, 2,573,955. Expilly, in his Diction. (Paris, 1769), gives the population of the Brest district as 1,463,084, a fact which cannot now be much particularly noticed in treating of their history. The language of Lower Bretagne has for its basis that of the antient Celts, but of more modern form and more mixed character than the Welsh, which is another branch from the same stock. Upper Breton is spoken in this district.

The following extracts from Mrs. C. Stothard's Letters written during a Tour in Normandy, Brittany, and other parts of France, in 1818; 4to., 1820, describe the present condition of the peasantry of this province.

"... The roads are mostly built of mud; men, pigs, and children live altogether without distinction, in these cabins of accumulated filth and misery. The people are indeed dirty to a loathed excess, and to this may be attributed their unhealthy and even cadaverous aspect. Their manners are as wild as savage as their appearance; the only indication they exhibit of mingling at all with civilized creatures is, that whenever they meet you they bow their heads or take off their hats in token of respect. I could not have supposed it possible that human nature could have become so debased, or that it could have come into this province. The common people are apparently in the very lowest state of poverty. In some parts of Brittany the men wear a goat-skin dress, and look not unlike Döfel's description of Robinson Crusoe. The furry part of the coat is worn on the inside, and the hair falls nearly below the knees. Their long shaggy hair hangs dishevelled about their shoulders, the head being covered by a broad slapper straw or beaver hat. Some few of the Bretons go without shoes or stockings; but the generality wear sabots (wooden shoes) or thrust straw into them to prevent the foot being rubbed by the pressure of the wood. You frequently see the women, both old and young, Lauretching along the fields with the distaff, employed in spinning off the flax. The girls carry milk upon their heads, in a little basket, which they fasten for security during the common Roman household vessels."—p. 195, 196.

"... The Breton language appears to me, from the number of French words I continually hear spoken with it, far more corrupted than the Welsh. I imagine it probably arises from the people of Brittany holding a freer intercourse, and having mixed more with the French than the Welsh formerly did with the English: this may be accounted for, as Brittany is certainly a country easy of access, nor is it defended or insulated by those barriers more thickly occupied in Wales."

"... The Bretons do not resemble in countenance either the Normans or French, nor have they much of the Welsh character. They are rude, uncivilized, simple people, dirty and idle in their habits. . . . . The women are invariably dressed in the same fashion, and I have already described." It differs here and there, but not importantly.

* This description is not quoted here.

in some of the districts. Many of the women of the very poorest kind wear this dress till it becomes so dirty, patched, tattered, and ragged, that you can scarcely trace what it had originally been; and I have seen several children so wretchedly off for clothing, that they run about almost in a state of nudity. These people are tolerably respect- able, and are dressed decently in their singular costume, look florid and healthy; while those attired in the ragged garments, bear a squallid and meagre aspect—this arises, I am induced to believe, from the greater dirt and poverty of the latter.

... The chestnut abounds in Brittany; there are many large forests composed entirely of that tree; their produce, boiled in milk, supplying a means of subsistence for the poor during the greater part of the year. The people collect the chestnuts in sacks, and pile them up within their cabins; several families are even so needy, that they seldom taste the luxury of bread; but these are amongst the children of wretchedness in the extreme degree. I am informed that in the neighbourhood of Brest the lower orders resort to acorns as well as chestnuts for food, which have some nutritious qualities when boiled in milk. The Breton houses (excepting in the towns) are generally built of mud, without order or convenience. It is absolutely a common thing in Brittany for men, women, children, and animals, all to sleep together in the same apartment, upon no other resting-place than that of the substantial earth, covered with some straw. We once saw, near Josselin, a man drive into his cabin a cow and a horse, followed by a pig, and afterwards entering himself he shut the door."—p. 233-235.

... The Breton country, capable of rendering them prosperous and wealthy, but little cultivated by their own exertions; and they owe their chief support to the abundant forests of chestnut, and the indigenous productions of their soil. Vast tracts of country appear overgrown with the chestnut, and these parts insensibly thicken till they become wild; others, where a richly-laden harvest would simply repel the labours of the ploughmen, remain totally neglected. The Breton grovels on from day to day, arid from year to year, in the same supine idleness and dirt. If you chance to meet a Breton in his sable cloak, and ask him why, there are so many groves of apple-trees, he does not make cider (for the greater quantity is imported from Normandy), he will tell you, his father neve... so. If you say, why not grow more corn? he an... I have gathered chestnuts from a boy."—p. 256.

Bretagne possessed before the revolution a local legislature (Les États Généraux—States General), once held every year, but after 1630 only every two years. The order of the nobles and of the clergy formed constituent parts of this state. The extremists and moderate party (Les Bourgeois) had their representatives at the deputies of the following places, which may be considered as antiently of the greatest importance in the prov.

The pop. is from the returns of 1832.

*This description is not quoted here.*
one of his lieutenants, P. Crassus, with one legion to subdue the Armoricans; and so great was the terror to the Roman arms that they submitted without striking a blow. But they revolted the next year, having seized the envoy whom P. Crassus had sent to procure corn; the Veneti taking the lead in the revolt and instigating the others. The inroads of the Veneti, according to Caesar, exceeded that of any other on this part of the coast, not only because they had more ships (in which they traded with Britain), and greater knowledge and experience in naval affairs, but also because their possession of the few harbours which lined the coast of the Britons and Armorican coast enabled them to exact tribute from those who frequented that sea. Caesar acted with his usual vigour. He ordered a fleet to be built on the Loire, and manned with seamen from the coasts of the Mediterranean; he despatched his lieutenants into different parts to co-operate with those who were to attack their enemies, and to detain them at home for the defence of their own country. He himself marched into the country of the Veneti, who trusting to the difficulties which would impede his march, to the scarcity of provision, and to the ignorance of the Romans of their coast, fortified their towns, erected into a corn that was cut in the country, allied themselves with other states as far off as the Morini and Menapii (people of Picardie and the Netherlands), sent for aid over into Britain, and prepared for a stout resistance. It is impossible to describe to ourselves how near the Roman, and as being thus better adapted for a coast abounding with rocks and shallows, while the height of the prow and stern enabled them to withstand the violence of the tempests, and the general strength with which they were built up from being anchored in the sheltered bays and banks of the Roman ships. Their sails were of hides, which they used either for their strength or because they knew not the art of manufacturing linen cloth. Their fleet consisted of 520 vessels. Caesar stormed their towns, defeated their fleet in a great battle, and forced them to placate him, and punish them for violating the law of nations by detaining the Roman envoys, he put all their senate to death, and sold the rest of the people into slavery. 

In the general rising of the Gauls, towards the close of Caesar's campaign, the different tribes sent their respective contingents to the force destined to raise the siege of Alesia, the whole of the Armoricans contributed but 6000 men; and this appears to have been the last effort they made for independence while Caesar was in Gaul. The discontented Cénomans, and others, took arms against the Romans and other Germans, forsook their native land and settled in Armoric, where the Emperor Constantius Chlorus gave them lands. A similar emigration is said to have taken place in the year 364. These emigrations were however unimportant in their character and influence, unless we suppose that from them the prov. or some portions of it received the name of Britannius, which is given to it by Sulpius Severus before any subsequent invasion had taken place. (Carp, Hist. England, vol. i. p. 6.) The next settlement, that of the Britons in一枚, takes place at the time when the cause has been the subject of much dispute. Those writers who have engaged in the controversy have had political interests to serve; the native Bretons contending for their provincial privileges, other writers contending against them on behalf of the crown, and each conceiving that the success of their cause depended on their proving or disproving the independence of the early Breton princes of the crown of France.

The account which has been received by Daru (Histoire de Bretagne, 3 tom. 6vo, Paris, 1828), though contested by many, yet is by Gibbon, and other historians, allowed. (Plutarch, viii. note 136), Turner (Hist. Anglo-Sax., c. viii.) and Vertot (Histoire Critique de l'Etablissement des Bretons dans les Gaules), is as follows:—When Maximus, in the year 383, was chosen emperor by the revolted legions of Britain, and passed over into Gaul to dethrone Gratian, who then shared the Western empire with his younger brother
Valentinian II, he took with him a considerable force of native Britons. Thus much is admitted on all hands; it is the following part which is disputed. The commander of these auxiliaries was Conan, a British prince. Maximus landed near Gaul, took the castle of the island of Grable, and defeated with great slaughter the army of Gratian at Aleth, now Quidalleit, near St. Servan, took Rennes and Nantes, distributed lands to his companions in arms, and bestowed the government of Armorica upon Conan, whom he sent back, giving him authority to act as he might think fit, to take possession of his government. Upon the defeat of Maximus by Theodosius the Great (A.D. 388), many of his soldiers took refuge with Conan, who managed to retain the government which he had received from the usurper, and even assumed the title of king. When the Vandals were on their way to the empire left the western provinces, in the possession of independence, the Armorican were released from the subjection in which they had been held; and in the year 419 the Romans recognized as their allies those who had lately been their subjects. Conan appears to be the last of the line, and we consider him till the year 421, when he died. He is usually designated Conan Meriaec, the latter name signifying, according to some, 'great king.' His successors are said to have borne the title of king till the time of Alain II., in the 7th century, and were engaged in various wars with the Franks, or with the barbarous nations, such as Alanus, and others, who had obtained settlements in Gaul. Their dominions, though the extent of them fluctuated with circumstances, were for the most part coincident or nearly so with the modern Breton.

In the history of these islands there are writers who deny that any migration of the insular Britons into Armorica took place until the commencement of the 6th century, when the pressure of the Saxons forced the unhappy islanders to abandon their native seats and retire, some to the western side of the island of Anglesey, Wallois, and others beyond sea into Armorica. These writers also assert the conquest of Armorica by Clovis; and they cite triumphantly a passage of Gregory of Tours, the eldest of the French historians, who says,—'Semper Britannia sub Francorum potentate post oblitum regis明智ii, recessit, et Graeciae ordinatam in hanc latitunt.'—'The Britons have been always under the power of the Franks since the death of the king Clovis, and have been called counts, not kings.' (Greg. Tur., I. iv. c. 4, quoted by Vertot and Daru.) But this passage of Gregory when carefully examined will not warrant the conclusion he gives of the earlier settlement of the Britons, and of their previous independence under kings of their own; for the limiting expression, 'since the death of the king Clovis,' intimates that antecedently they were independent of the Franks, which cannot be inferred by the reader from the passage last quoted. About a year or two years before the death of Clovis, which occurred in 511; and the notice, that since the same epoch their chiefs had been 'counts, not kings,' is an intimation that before that date they had possessed the regal dignity. The whole passage, though it does not fully establish the facts that are of the Breton writers, is by no means consistent with the representations of Vertot and other historians in what may be called the French interest.

If amidst these conflicting statements we may venture to give our own conclusion, we should say that the account given by Daru, though perhaps a distorted representation of facts, is not without foundation. It is likely that the British troops, who had followed Maximus into Gaul in 383, were settled by that usurper in Armorica, and were allowed, by the government of the Saxons, to remain on the lands after the defeat of Maximus. A colony of this kind was much more likely to influence the language and customs of the district in which they settled, than a number of miserable exiles escaping from the pressure of barbarian invaders, and finding their way as they could to a place of refuge in a foreign land. This infusion of a military population serves also to account for the rise of a free state in Armorica, upon the decay of the Roman power, while the rest of Gaul tamely bowed to the yoke either of their Roman masters or local conquerors. The evidence in favor of Conan's existence we see no just reason to doubt; and without placing implicit credence in the lists which the Breton writers furnish, we are led by the language of Gregory of Tours, and by other testimony brought forward by Daru, to admit that several succeeding chieftains, and perhaps Conan himself, took the title of king. The express testimony of Gregory must be admitted as sufficient to establish the fact that the power to which he refers was likely that it was not incorporated with the kingdom of the Franks, and that it retained its laws and even its native princes, though with a subordinate title.

There seems reason to think that in the confusion which may be connected with the invasion of the Saxons the Bretons recovered a precarious independence, and their princes re-assumed the titles of kings, though their dominions and authority were contracted by the usurpation of the nobles. This has probably led to the supposition that the Bretons, as a people, were divided in the year 690, as noticed above, the title ceased; and Bretagne, divided into a number of principalities, became again subject to the Franks, about A.D. 800, during the reign of Charlemagne, whose predecessors had probably made many encroachments. In the troubles of the following period, the kingdom of Bretagne was once more divested of its independence by Nomenoc (A.D. 824-851), who had been nominated governor of Vannes, by Louis le Debonnaire, son and successor of Charlemagne, and had revolted from Charles le Chauve. Enispe, the son of Nomenoc, A.D. 851-857, acknowledged the supremacy of Charles, but maintained his kingdom; and the civil dissensions among the Bretons themselves led to the extinction of this kingdom, A.D. 874. The country was divided into the counties of Rennes, Vannes, Cornouaille (Cornwall), and other portions; and civil discord between the varying states coincided with the invasion of the Northmen or Normans to affright the country. The kings of France claimed too a kind of sovereignty over the kings or other rulers of Breteche, similar perhaps to those which the kings of England claimed over the princes of Wales, Northumberland, Yorkshire, and the Marches, and which was extended over the whole of Bretagne or over a part only. This right of sovereignty was conveyed to the Northmen by Charles the Simple, when he ceded to them the country afterwards known as Normandie, A.D. 912. The dukes of Normandie undertook the regency of the kings of Bretagne, and themselves did homage for this province as well as for Normandie to the kings of France. This cession was the cause of long and bloody wars between the people of the two provinces, for the Bretons struggled fiercely against the barbarians, to whose supremacy they were thus arbitrarily consigned. They seem however at last to have acknowledged the dukes of Normandie as suzerains.

The following periods present little else than a confused series of wars, assassinations, and other violent events perpetually divided, aided by the neighbouring chiefs, the counts of Anjou and the dukes of Normandie. In 992, Geoffrey, count of Rennes, assumed the title of duke of Bretehe. Alain, his second, duke of Bretehe, was, from the year 1027 to 1060, the subject of the unwarrantable supported by the child of William the Bastard (afterwards the Conqueror), duke of Normandie. Several Breton lords accompanied William into England, A.D. 1068: one of these, Alain, count of Penthievre, built the castle and town of Richmond on the Swale, in Yorkshire, on the lands granted him by the Conqueror: this grant gave to a junior branch of the reigning house of Bretagne, at a period long subsequent, the title of Count of Richmond. Yet the Saxons nobles, who fled from England on the conquest of that island by the Normans, retained the liberty of the dukedom of Bretagne. Alarmed by the progress of the Norman power, the kings of France and the dukes of Bretagne naturally formed an alliance for their mutual support. Alain Fergent, duke of Bretehe, obtained some advantage in...
war over William the Conqueror, A.D. 1065; but he afterwards made peace with him, married his daughter Constance, and went in the first crusade to the Holy Land; not however as a prince with a military force, but as a simple pilgrim. In the divorce of the king's youngest son, in his war with his eldest brother, Robert, duke of Normandie; and the Breton forces signalized themselves at the battle of Tincchebrai, which concluded the contest by the captivity of Robert. Alain Fergent abdicated his duchy, and the Breton princes were al-
nalyzed by the establishment of a supreme court of justice at Rennes, and by the rise of two eminent men, natives of Bretagne, Robert d'Arbrissel, founder of the order of Fontevrault, and Pierre Abelard. Conan, the successor of Alain, gave to some of the Breton towns municipal constitutions. He died A.D. 1148.

A disputed succession, which led to the dismemberment of Bretagne, and to a civil war, in which the kings of Eng-
land (Henry II.) and France (Louis VII. le Jeune) took part, followed the death of Conan. The marriage of Con-
tance, daughter of one of the claimants, with Geoffroi, son of Henry II., added the duchy of Bretagne to the already vast possessions of the house of Plantagenet. Geoffroi was invested with the ducal coronet in the church of Rennes, A.D. 1169; he took a busy part in the dissensions of his family, and was killed in a tournament at Paris, whither he had gone to solicit aid against his father, A.D. 1186, aged 28. His posthumous son Artur (Arthur) came to the throne an infant; his early years were troubled by the ambition of his uncle, Fergent, during his minority, who was kept in the death of Richard, A.D. 1199, he was involved in new disputes with his uncle John, by whom he was, as it is generally believed, basely assassinated, A.D. 1203. The con-
quest of Normandie, which was declared to be confiscated, and the royal authority re-established, was the consequence of this atrocity; and Bretagne thus became immediately a fief of the French crown. The duchy came to Alix, daughter of Constance, by her third husband, Gui de Thouars; and in her right to Pierre de Breil,RV. By the marriage of Alix and the real family of France, to whom she was married A.D. 1215.

Pierre de Dreux, a restless and ambitious prince, reigned from 1213 to 1237; first as duke in right of his wife, and then, upon her death (in or near 1219), as guardian to his son, a minor. He endeavored to embroil himself with the clergy, which was excommunicated by the bishop of Nantes and the archbishop of Tours, metropolitan of Bretagne, and was only absolved by the pope upon hard conditions. Disputes with the nobles, caused by the attempts of Pierre to depress the power of the clergy, and of Gui de Thouars, a member of his family, led to a civil war; and though Pierre got a victory near Chateaubriand, in 1223, over the revolted lords and their allies, he does not appear to have gained much by the contest. The rest of his government was passed in a series of wars; he was at the side of Louis VIII. and Louis IX. (St. Louis). On one occasion the duke transferred his homage to the king of England, Henry III., whom he recognized as king of France. In 1237 he abdi-
cated his power as guardian of his son, and was intrusted by the pope with the conduct of an expedition against the infidels beyond sea: in 1248 he accompanied St. Louis in his crusade against Egypt, and was wounded and taken by the side of that prince at the battle of Mansourah. He died on his passage back to Europe in 1249, at a castle called Jean I. (1237-1286), Jean II. (1286-1305), Artur II. (1305-1312), and Jean III. (1312-1341), present few incidents of moment; but the death of the last-named prince brought on the dispute for the suc-
cession to the duchy between Jean de Montfort and Charles de Blois, and led to the war which forms so important an episode in the wars of England and France under Edward III. of England and the kings of France of the house of Valois. Jean III. left no children: he had two brothers, or rather one brother, Gui, count of Penthièvre, who died before him, and two over-manned sons, who, Mont-
fort, who, immediately upon the death of Jean III., took possession of the duchy. Charles de Blois claimed in right of his wife, who was daughter and heiress of Gui, and the

* In the earlier periods of Breton history, the bishops of Nantes, which were founded by the Normans en route to the Carolingian dynasty, and re-established the kingdom of Bretagne, he erected Du-

** The Breton archbishops appealed to the pope, who kept the dispute undecided for about 350 years. In 1190, Innocent III., at the council of Paris, deposed a bishop for the sin of simony. In 1240, the archbishop of Tours, who is still metropolitan of this part of France, decision was referred to the king of France as suzerain. The case was argued before a court of the peers and grandees of the kingdom: Montfort, who had reason to fear an unfavourable decision, fled secretly from Paris; and a deathbed confession of Charles de Blois duke of Bretagne. Montfort immediately sought the protection of the king of England, who willingly gave him his support; and, by a singular concurrence, Edward III., who claimed the crown of France through a female, supported Montfort against a female claim; while Philippe VI., the actual pos-
sessor of the crown of France, whose right rested upon the exclusion of females from the succession, supported a female in her claim to the ducal coronet of Bretagne. But interest and ambition little regard such inconsistencies.

This question of political order says Dauru, 'once left to the decision of fortune, was alternately on the point of being decided in favour of each party. In the many changes of a war which lasted more than twenty years, the two com-
}

...
A second attack upon Hennebon marked the year 1542. Before the end of the year the countess of Montfort crossed the Rhine with a large fleet. She left Germany with a turning with a fleet of 46 vessels, when near Guemnitz she fell in with a French fleet of 22 great ships manned with Genoese seamen, and having on board 1000 men at arms under the orders of Charles de Blois himself. The battle was joined, but the reinforcements which Charles had been able to obtain gave the French the advantage, and four English ships were taken. The countess landed with her reinforcements, and the kings of England and France arrived in Breteagne with hostile forces; but early in the year 1543 a suspension of arms between the two potentates was agreed upon, and the Breton forces, with some mercenary companies, were left to carry on the war. In 1544 the Montfort party was strengthened by the severity of the king of France, who, without form of trial, put to death a Breton lord, Olivier de Clisson, on a charge of traitorously forming an alliance with England. The news of Clisson's death gathered some troops, surprised a castle held by the friends of Charles de Blois, and distinguished herself by her exploits in a war in which, more than in any other, women emulated the warlike fame and courage of men.

In 1545 Jean de Montfort managed to escape from the Louvre, after a confinement of three years. He landed in England, did homage to Edward as his suzerain, obtained aid and returned to Bretagne. He died however shortly after, and the rights of his son, a mere child, were bravely assumed by Jeanne de Penthièvre. In 1547 Charles de Blois, who had besieged Roche Derrien near Treguier, was surprised and taken prisoner by an inferior body of English troops. His wife, Jeanne de Penthièvre, sustained his cause with a valor equal to that of her husband, and the death of the Blois which for the English induced many of them to embrace her party. In 1556 Charles recovered his liberty by ransom, and renewed the war, which was carried on for seven years longer, during which no decisive act took place. In 1562 Jeanne de Montfort signed a treaty with Brittany in which the Montfort party was to be divided into two parts, having Nantes and Maine for the one, and the Breton coast for the other; but the death of Jeanne de Penthièvre, who told him that she had married him to defend her inheritance, not to yield up half of it, determined Charles to break it. The following year witnessed the decisive battle of Avaris, in which Montfort, Chandos, and Olivier de Clisson overthrew the army of Charles de Blois, though he was aided by the bravery and skill of the celebrated Bertrand Duguesclin. Charles de Blois himself fell in the action, and the treaty of Guerande in 1565 secured the duchy of Bretagne to the house of Montfort.

The death of Montfort (December 1566) was no competitor for the duchy, his possession of it was neither quiet nor uninterrupted. His own violent disposition precluded repose. The course pointed out to him by the gratitude due to England for past services and his present duty of fidelity to France was a failing, but not dead; and Jeanne the second of his wife, who after left her service for that of the French king, a French army under Duguesclin, now constable of France, himself a Breton, entered Bretagne (A.D. 1570), and the duke, abandoned by his subjects, was obliged to seek refuge in England, and landed at the court of Henry VIII. He was not finding a new life, and again retired to England. The ambition of Charles V. of France brought about his restoration: that prince procured the confiscation of the duchy (A.D. 1575) by a sentence of the court of peers, and afterwards had an order of conducting the process. He further seized upon the duchy himself instead of transferring it to the next heirs, and attempted to establish the Gabbele or salt tax. This violation of their independence around the Bretons, the duke, lately the object of general disdain, was recalled and received with the warmest affection (A.D. 1580). He might however soon have incurred another expulsion through his undue partiality for the English, but Charles V. might have taken advantage of the rising discontent in the Breton, but dead; and Jean made his peace with the government of his successor, yet a minor, in a treaty in which he stipulated to give aid to the French in the war against the English. Against the conditions of this treaty he broke, and the English, under the orders of Charles de Blois himself, the battle was joined, the object of general disdain; and the duchy was restored to the Blois, who had not the insinuity of the king interrupted the design. Clisson himself waged war against the duke: the contest was furious, and lasted till A.D. 1595, when peace was concluded. Jean de Montfort died A.D. 1599.

In 1568 Vincent de Blois was created Duke of Angoulême. He had been married while yet a child to a daughter of the French King Charles VI., and upon attaining his majority was involved in that perplexed scene of disturbance which marked the reign of the unhappy maniac. It would be needless to follow him through the various changes of party, from Armagnac to Bourguignon, from French to English, to which unsteadiness or perfidy led him, by which however he preserved Bretagne from war until the year 1525-26, when it was partly ravaged by the duke of Bedford, and partly scourged by forces for Charles IX. enragè at Jean for having deserted the English interest for that of the Dauphin. Bretagne derived some advantage from this war, by the settlement of many families who left other parts of France to take refuge in this, more secure territory. In 1568 the Montforts were expelled, and the Blois were brought by some Norman emigrants. Two other incidents mark the reign of this duke. In 1520 he was enamored and taken prisoner by the count of Penthièvre and his brothers, princes of the house of Blois, grandsons of Charles V. of France, and held in a manner by the late duke. Jean obtained however his release, and the event led in its consequences to the ruin of the house of Blois. In 1440 Gilles de Laval, Maréchal de Retz, a principal Breton lord, was condemned for sorcery and banished to the Ile de Louisborg, but his imprisonment was a reason for him to ruin he had sought to recover wealth by alchemy and sorcery. He was reproached with the murder of many wives whom he had successively married, and of more than a hundred children. He was burned alive in the presence of the duke near Nantes. In the year 1442 Jean V. died. Jean V. was succeeded by his son, François I. Gilles, younger brother of this prince, having quarreled with him on the ground of the insufficiency of his inheritance, attempted to call in the English. The duke procured the aid of Henry VII., and came to the assistance of his brother in arms, who in 1453 died. He wished to bring him to trial before the states of Bretagne, but not succeeding, he at last had him smothered in prison after a captivity of nearly four years, A.D. 1458. When the death of Gilles became known, a cordelier, who was his confessor, presented himself before the king, and in an awful voice summoned him, on behalf of the dead prince, to appear forty days afterwards before the tribunal of God. The impression made by this prophecy led to its fulfillment: the duke died on the very day foretold, July 26. The course of his son's reign in the period of III., presents no points of interest, save that Pierre, who was brother of François I. and of Gilles, caused the murder of the latter to be put to death, except Artur de Rueur de Nantes, who murdered the murder, who became monk, and died bishop of Bonport in 1477; still, at that time, as count of Richemont (Richmond), had served with distinction in the French army, and had become constable of France, distinguished himself by his zeal against sorcerers. Never since the days of Charlemagne has a more firmly all heresies, and sorcerers and sorceresses; the Duke of Anjou appeared, for he caused more of them to be burned in France, in Poitou, and in Bretagne than any one else of his day. Pierre II. held the duchy from 1450 to 1457; and Pierre III. from 1457 to 1488.

The first part of the long duel reign of François II. (1458-1488) coincided with the reign of the astute Louis XI., whose desire of repressing the enormous power of the great feudal nobles led him into frequent disputes and contests. In 1462 Francis entered into the confederacy of the nobles against the king, known by the title of "The
league of the public good' (Ligue du bien public). The Bretons were too slow in their movements to take part in the battle of Montébérery, but they assisted in the blockade of Bordeaux and Nantes.

The duke received several concessions from the king in the city of St. Maur which Louis was obliged to sign. The troubles of France did not cease with this treaty: hostilities and intrigues continued, and François distinguished himself by his valour, the latter part of which was rewarded with the dukedom of a very feeble character, being ruled by his mistress, Antoinette de Magneville, lady of Villerquier; by his favourite the lord of Lesun; and by his minister Landois, the son of a tailor at Vitré. This last, a man of considerable talent and boldness, might have been expected, the hatred of the nobility of Brittany, who at last rose in revolt; and the duke was obliged, by the defection of his forces, to give up the object of their hatred to his enemies, A.D. 1484 or 85.

Landois was forthwith tried on many charges, condemned, and hanged. In 1486 Francois invited himself with Maximilian, king of the Romans, who had married the heiress (since dead) of the late duke of Bourgogne; with the king and queen of Navarre; the dukes of Lorraine, Orleans (their presumptive to the throne of France, and afterwards Louis XII.), Foix, and others, for mutual protection and support against the court of France, which was now directed by Anne, lady of Beaujeu, daughter of Louis XI., and guardian of her young brother the King Charles VIII. This led in 1487 to the invasion of Brittany by the French. Henry VII. had in the meantime died; and for some time in Brittany, did not interfere in time: the occasion seemed favourable for annexing Brittany to France, the king of which country laid claim to the duchy, by virtue of the rights of the house of Blois, which Louis XI. had claimed. Several of the principal Nantes were taken prisoners on the field. A treaty was hastily contracted between St. Aubin de Cormier between the French army under La Tremouille and the Bretons and their allies, English, German, Gascons, and Spaniards: the latter were defeated with loss, and the duke of Orleans was taken prisoner on the field. A treaty was hastily contracted between St. Aubin de Cormier, defeated just after its conclusion, the 7th or 9th Sept. 1488.

Anne, daughter of the late duke, succeeded to the duchy. Her situation was embarrassing and painful. The maréchal de Bouicaut, her guardian, and other powerful persons at the court, wished her to marry the Sire d'Albe, a Gascon noble, to whom she was exceedingly averse. Some English and Spanish auxiliaries arrived to defend her against the hostile designs of France, but she feared that the English would make her a prisoner in her person, and compel her to marry the Sire d'Albe. She, however, entered into these intrigues and annoyances, she gave her hand to the Archiduke Maximilian, to whom she was married by proxy in 1489. The French wished to dissolve the marriage, which had never been consummated; and in the year 1490 hostilities recommenced between Breton and French.

The Sire d'Albe, piqued at his rejection by the young duchess, put into their hands the important town of Nantes, which he had surprised; and the duchess herself was besieged in Rennes, and reduced to the necessity of negotiating. During the negotiations a proposal was made, on the part of the French, listened to by the Breton leaders, and finally carried into effect, that the duchess and the young king of France, Charles VIII., should reconcile their discordant claims by marrying. The difficulties of the way were overcome as far as the ceremony of marriage by proxy to Maximilian, and Charles was engaged to marry the same prince's daughter, who had been sent to France being yet under the marriageable age. These difficulties were broken through; the young archduchess was sent home, Charles and Anne were married, the marriage being from the pope then solicited and obtained. This marriage took place A.D. 1491; and by the terms of it the rights of whichever party first were to go to the survivor, in default of lawful issue. The duchess was bound also, if she survived her husband, to conform to the laws of France, and if she had no children, to marry a prince of the blood of the house of Burgundy. This marriage was solemnised by the archbishop of Rouen, and the ceremony was performed with all the ceremony of the law, and the marriage was entered upon the registers of the church.

In 1498, Charles VIII. died without children: and in 1499, nine months after his decease, Anne married his successor, Louis XII., and the duchy of Brittany was acquired by unjustly and perfidiously divorcing her former wife Jeanne, daughter of Louis XI., though she had never abandoned him in his troubles. The articles of marriage between Anne and the new king were designed to separate the crown of France from the ducal crown of Brittany, by providing that the latter should descend to the second son, or in default of a second son, to a daughter, so as to give to the power of a sovereign of his own race. The duchess had no daughters; the elder was promised in marriage to a young prince of the house of Austria, afterwards celebrated as the emperor Charles V., and was to have, as her dowry, Breton, Bourgogne, the county of Blois, and several possession in Italy. Considerations of state never set aside the marriage; and Louis, to prevent the dismemberment of the kingdom, broke the treaties in which it had been arranged. The duchess Anne died A.D. 1514, aged 37 years. Her daughter Claude married a few days after to the duke of Alençon, having learned nothing to the French throne, which he ascended the death of Louis XII. in 1515, under the title of François I.; and shortly afterwards Claudio ceded to her husband her rights in Brittany during her lifetime. It was not until several years after her death, which was in 1594, that Brittany was formally united to France: this union took place in 1592. It was however little more than prospective; for Claude had bequeathed the duchy to her son the daughter, who was recognised as sovereign of the country; but the act of union provided that it should be irrevocably united to the French crown.

We might here terminate our sketch of the history of Brittany, for the events which occurred during the religious wars of the sixteenth century claim more notice. But it is amongst the warlike deeds of the old days that the duchy appeared in the husbands of two of the granddaughters of François I., king of France; and in the dukes of Mercœur, a branch of the powerful and ambitious house of Lorraine, who claimed to represent many of the chief families almost of the time. The houses of Blois and Penthièvre. The duchy had been imprudently nominated by Henry III. governor of the province, and he took advantage of his position to raise forces at once to support 'the league,' and to sustain his own pretensions. Upon the death of the duchess of Montmorency, the duchy was opened to open contest (about 1588); Nantes declared in his favour; Rennes was seized by his partisans, but recovered by the inhabitants; the greater part of the province was in his power; and the count of Soissons, who was sent to suppress him in the government, was taken prisoner by him on his road. He openly asserted his claims, and war was carried on with activity between him and the prince of Dombes, who commanded the royalists. A body of Spaniards landed to support the duchy; a body of English came to join the royalists. The duchy was sustained by partisan corps; and the war was only concluded by the approach of Henry IV., with whom Mercœur, through the intercession of Gabrielle d'Estrees, the king's mistress, made an advantageous treaty, receiving considerable sums of money and seigneories. The duchy yielded to the claims of the duchy. It was in this expedition to Brittany that Henry issued the celebrated edict of Nantes, 13th April, 1598.

From this time the history of Brittany ceases to possess importance. It became completely a province of France, and the traces of its separate existence (except always the prevalence of the Breton language), which diminished during the monarchy, have been quite obliterated in the new arrangements induced by the French Revolution. (Daru, Histoire de France.)

BRETON, CAPE. [CAPE BRETON.]

BREUGHEL, PETER, the son of a peasant, was born at Breugel, a village in the neighbourhood of Breda. He was placed under Peter Koch of Aalst (Alost), whose brother had been successively the pupil and assistant of Bruegel the Elder, and was himself practising under that master, he travelled into France and Italy. He took many views by the way, particularly among the Alps.

Returning from Italy, he fixed his residence at Antwerp, which was admitted into the academy of that city in 1551. Here he lived for a long time with a mistress, whom he would have married, but for a habit she had of lying; which so displeased him, that he transferred his attentions to the daughter of his old master, now dead, and obtained her hand upon resisting her father's intention. While painting a view on the canal which communicates with the Scholst, by order of the magistrates of Brussels, he was seized with his last illness. As he lay on
any former commission; but while serving on courts-martial, with a detachment composed only of his own regiment, he did duty as a captain, and bears the date of his commission in that regiment. Brevet rank, therefore, is to be considered effectual for every military purpose in the army generally, but of no avail in the regiment to which the officer holding it belongs, unless it be wholly or in part under a temporary commission; as for instance in Samuel's Historical Account of the British Army, p. 615.)

Something similar to the brevet rank above described must have existed in the French service under the old monarchy, for, according to Petis de la Daniel (tom. ii. p. 217 and 277), the third service warrant of a captain in the regiment of nominating subaltern officers to the rank of captains by a certificate, which enabled them to hold that rank without the regular commission. The same author states also that a bapteme d'armes commanded the regiment of another, whatever might be the date of his commission. He was placed at the bottom of the list in the regiment which he entered, without, however, losing his right of seniority when employed in a detachment composed of troops drawn from several different regiments.

The introduction of brevet rank into the British army, as well as that of the half-pay allowance to officers on retiring from regimental duty, probably took place soon after the revolution in 1688. But the practice of granting, when officers from other regiments were released for particular purposes, a nominal rank higher than that which they actually held, appears to have been of older date; for in the Soldier's Grammar, which was written in the time of James the First, it is stated that the lieutenants of colonels are captains by courtesy, and majors in a company (court-martial) as major captains of the regiments in which they served. (Grose, Military Antiquities, vol. ii.) It was originally supposed that both officers holding commissions by brevet and those on half-pay were subject to military law; but, in 1748, when the innovations of half-pay officers within the sphere of its control was objected to as unnecessary extension of that law, the clause referring to them in the Mutiny Act was omitted, and it has never since been inserted. In 1756 it was decided in Parliament that brevet officers were subject to the Mutiny Act in time of War, but that half-pay officers were not. (Lord Woodhouse's, Essay on Military Law, p. 112.) Brevet command was frequently conferred on officers during the late war; but the cause no longer existing, the practice has declined, and at present there are very few officers in the service who hold that species of rank.

BREVIA'RIUM was used among the Roman writers to denote a book introduced by Augustus, containing the accounts of the empire, the enumeration of the military, &c. Its design in the design of this breviarium was to explain to the Roman people the use of the monies levied upon them were applied; not to the emperors' private use, but for public purposes. Tibullus laid aside the breviarium, but it was resumed by Caligula. (Sueton. Cig. c. 10.) The breviaire, or breviarium, is become our breviary, being the same. Indeed some have gone so far as to introduce the half-quarter-demissiemicuvar; and among those who have been guilty of so monstrous an absurdity, we regret to mention the name of Baethune.

BREVET, in France, denotes any warrant granted by the sovereign to an individual in order to entitle him to perform the duty to which it refers. In the British service, the term is applied to a commission conferring on an officer a degree of rank immediately above that which he holds in his own regiment; without, however, conveying power to receive the corresponding pay. Brevet rank does not exist in the royal navy, and in the army it neither descends lower than that of captain, nor ascends above that of lieutenant-colonel. It is given as the reward of some particular service which may not be of so important a nature as to deserve an immediate appointment to the full rank: it however qualifies the officer to succeed to that rank on a vacancy occurring, in preference to one not holding such brevet, and whose rank is the same as his.

In the fifteenth section of the Articles of War it is stated that an officer having a brevet commission, while serving in courts-martial, bears as his rank the same as his commission date.
Adrian I., Gregory III., and Gregory VII.; and in the progress of time, in compliance with the superstition of the day, the legendary lives of the saints were inserted, full of ill-attributed and improbable facts. This gave occasion to many revisions and re-formations of the Roman Breviary, particularly, in the councils of Trent and Colonia, by popes Gregory XIII., Paul V., Paul IV.; as likewise by some cardinals, and especially by Cardinal Quignon, who carried the reformation of it to the farthest.

An additional reason for reforming the Breviary was found in the circumstances that different churches and orders of religious had their several offices, varying from each other, but still under the same name. Granoclas has separate chapters, de Ecclesiariis Orientalium Breviario—Distributio Officiorum apud Graecos—de veterum Occidentis Ecclesiasticarum Breviariis, was the title given by the Roman Breviary in the English churches. But the variety of form, as already shown, was not confined to England; there was scarcely a church in the communion of Rome, in France, Flanders, Spain, Germany, &c., which had not something particular, however inconsequential, in the form and manner of its Breviary.

Pope Pius V., who adopted the Breviary as decreed by the council of Trent, ordered all former Breviaries to be laid aside by 1567. His rescript dated at Rome 7 id. July, 1568, whether of these new forms of Breviaries of Clement VIII., in another rescript dated 10th May, 1609, recognised Pius Vih’s abolition of the Breviaries as used in different churches according to their particular forms of services, of which the Breviaries of 1568, or 1569, and the Breviary VIII. again confirmed it under a new revision 25th January, 1631. This last revision, by which the work was brought nearer to the simplicity of the primitive offices, is at present the Breviary of the Roman church in general use. It was published in 1697. under the direction of Ferdinand de Bergem, bishop of Antwerp, intitled ‘Breviarii Romainius, ex decreto sacro—sancti Concili Tridentini restitutum, Pii V. Pont. max. jussu editum et Clementinis VIII. primum, nunc denuo Urbani PP. VIII. autoritate recognitum, fol. 1569.

The obligation of reading the Breviary every day, which at first was universal, was by degrees limited to the beneficed clergy alone, who are bound to do it on pain of being guilty of mortal sin, and of refunding their revenues in proportion. It is still retained in the Breviary of 1697. In addition to Granoclas’s work already quoted, and the rescripts prefixed to the Breviary of 1697, the reader may consult Koecher’s ‘Bibliotheca Theologica Symbolica et Catechetica, itemque Liturgica,’ vol. II., 1751, p. 747–768, where he will find a critical account of the editions of the Breviary since 1549.

BREVIARY consists in the process of extracting a saccharine solution from grain, and in converting that solution into a fermented and sweet spirituous beverage called beer or malt liquor. By a process, a usual of making this beverage, nearly all its stages, has not until very lately been indebted to chemistry for any of the improvements which have been made in its details. This we may attribute to the rare occurrence of a practical chemist being engaged in the operation of brewing. However, we find that within the last few years, and even the last few months, very great advantages have been made, more particularly by the continental chemists, to our knowledge of that primary and important operation in the process of brewing, the conversion of starch into sugar, or malt, by the action of the newly-discovered principle called diastase.

This art is of great antiquity, for we find that the Germans, in the time of Tacitus, manufactured an intoxicating drink from wheats, a beverage and the Saxons also had various drinks of the same class; some made from grain, as malm; others from honey, as mead: but in Germany, in particular, they were early famed for their beer and ale. The towns of Lubeck and Rostock stand foremost in the list for their double beer or Brunswick marm, as it was called, at which places it was manufactured to an enormous extent, the latter town exporting, above 1,000,000 barrels. Heavy duties were, however, levied on this country on these imports, amounting at last, in the beginning of the reign of Queen Anne, to the enormous sum of 15s. per barrel. This heavy impost, together with the importation in the brewhouses of this country, put a stop to the introduction of this article. Within late years the manufacture of beer has increased to an amazing extent, and the following statement of the quantity of materials employed in London only, for the year 1809, will be the result of these operations which are generally carried on. The excise returns of malt consumed by the metropolitan brewers, for the year ending October, 1835, were 4,528,264 bushels, or 702,533 quarters, which we may fairly calculate would require on the average at least 63,738 cwt. of hops, and yield about 2,500,000 barrels of beer.

The process usually followed by the brewer of the present day may be divided into eight distinct parts, independent of the malleating: namely, first, the grinding of the malt; secondly, the steeping; thirdly, the operation of steeping—cooking, or malting; fourthly, the fermentation; fifthly, the cleansing; sixthly, the cooling; seventhly, the racking or vatting; and eighthly, the fining or clearing. In considering these various subjects, it will be better to go over the processes in their order, and then return to the proper place in the course of the subject, with a view of the heat and precautionary details, &c. In brewing the various beers, as ale, porter, and table-beer, these three distinct kinds of malt are employed; the pale and amber malts, the brown or boiled malt, and the roasted or black malt. The first of these alone is used for the finer qualities or higher priced malt, the drier the pale, or pale ale. This first quality of grain gives the saccharine extract; the second, or blown malt, gives the flavor to porters and stouts; and the last variety is used only as a colouring in making the malt for brown and roasted. The pale and the pale ale are employed for the same purpose, but which is not permitted by the excise laws. The roasted malt is also sometimes called patent malt. As the manufacture of these varieties of malted grain is more properly considered under the article MALTR, it will suffice for our present purpose to state the peculiarities of each, which depend entirely upon the different heats to which they are exposed in drying.

The grain being selected, we arrive at the first stage of the operation, the grinding, which is conducted either by common or mechanical means. For the purpose of getting the malt to pass between two cylindrical iron rollers, placed horizontally at a certain distance from each other, with the space between them regulated by adjusting screws according to the size of the grain (crushed or cut malt) required. As the grain passes between the rollers, the grain on the outer part of the roller, in consequence of the pressure of the grain, is crushed or cut, and the inner part of the roller is covered with the same. The object is, however, to believe that a greater extract can be obtained from a coarse one. Some parties use the millstones, others the rollers; but others again employ both, using a circular sieve called a separator, through which the grain passes from the millstones, and only the grains that may have escaped this operation are carried to the rollers to be crushed.

The gist being thus prepared is now ready for the process of mashing. The mash tun, in which this operation is performed, is usually of wood, variously grooved according to the quantity of malt to be wetted, and having two or more holes, or tap holes, in the bottom. From one to two inches above this bottom is a false bottom or diaphragm covered with a layer of mash, on which a large vessel is placed; the hot water is then admitted either, above or between the true and false bottom of the mash tun, and the gist is now to be intimately mixed with the water. For this purpose it is either worked by machinery consisting of a mechanism for horizontal or vertical rotation, and the whole, or a portion of the grist mashing, or by a hand masher, or made by a man from the grist, and the water, with a gentle movement on the vat, in a circle or spiral. This being completed, the whole is allowed to stand at rest for a certain time, and the tap or filter is then opened or set, as it is termed, at the bottom of the mash tun, and the
infusion or sweet wort is allowed to run off into a vessel called the undebuck, from whence it is pumped or other-
wise conveyed to the copper for boiling. When the taps are spent, or when the goods have drained sufficiently so that very little wort runs from them, the taps are closed, and a fresh quantity of hot water is run on for a second mash. Brewing coppers for small breweries are generally open; but in the large establishments dome coppers are employed, and on the dome of the copper a vessel is con-
structed called a pan, by which both time and fuel are sav-
ered. Distilled or fermented wort is run into the beer vessel at the same time that the boiling is going on in the closed copper below, the steam from which is also driven into the pan, so that in the course of the time required for the wort to boil, the flasks in the pan are filled to the boiling temperature.
When the whole of the worts are pumped into the copper the hops are thrown in, and the boiling then commences. Large coppers are supplied with an apparatus called a rouser, consisting of a vertical rod of iron extending to the bottom of the copper, with chains hanging from the horizontal arms which branch off from it, and which are dragged round the bottom by machinery so as to prevent the hops from settling down and burning. When the boiling is complete, the whole contents of the copper are run into the beer vessel, the beer vessel is large square or oblong vessel of wood or iron, having a false bottom for large brewing, and a sieve partition at the corners for small ones.
As the boiled wort drains from the coppers, they are allowed to run down into the coolers. These boards, when sufficiently drained, may again be boiled with a second copper of wort, or with the return wort or table beer. The coolers are large shallow vessels, placed in as open a part of the brewery as possible, so as to command a free current of air, and to be free from dust and shelves. In the bottom of either wood or iron. The latter possesses many advan-
tages from its cleanliness, and the exposure of a large radiating surface to assist the cooling. There are however many foolish prejudices against the use of the latter. Fans and fanning machines are brought into use to assist the rapidity of this process. The fans are placed in the middle of the cooler and whirl round, producing a considerable move-
ment and current; but where the copper is large, this whirl-
ing is for the purpose of assuring the surface of the wort and causing any fresh admission of atmospheric air; whereas the blower, which is situated on the outside of the cooler, and has a wooden pipe with lateral openings extending directly across the wort, is continually forcing fresh and cold air over the surface of the wort in the continuous manner, the wheel working within a box closed at all parts, except round the axle of the wheel, at which the cold air enters, and at the opening of the wooden pipe through which it is ex-
pelled. When sufficiently cool, the worts are allowed to run into the beer vessel. As great care is to be taken that the worts remaining too long in the coolers, more particu-
larly in summer, it becomes necessary to employ artificial means of cooling by refrigerators, the principle of which is this: a current of cold water flows through a main in one direction, the hot wort is made to traverse in the chains site, either in an inclosed pipe within the liquor main, or
around the exterior of the cooling surface. Various appa-
ratus of this kind have been constructed, but those of Wheel and Gregory, of which the latter, are to be pre-
ferred from the facility of cleanliness thereof.
The next operation, that of fermentation, is carried on in a vessel called a gyle, or fermenting tun, which is either of a square or round shape: the latter is preferable on account of its surface, the water in being thrown on, and is usually placed outside of the vessel in the hoops, while the square is braced together in the interior by means of knees and stays at the corners and bottom, and if of a larger size by two or three tiers of iron rods, or tiers which pass through the sides of the vessel. The liquid in the former is liable to settle, and can only be agitated by means of skimming bad yeast and dirt. As soon as the worts begin to run from the coolers, and when a sufficient quantity is in the tun, the yeast should be added, being first rendered thin by some of the wort, so as to be easily miscible when thrown into the remainder. When the fermentation has arrived at a certain point of attenuation, that is, when a certain quan-
tity of the saccharine matter of the wort has been converted into alcohol or spirit, it is to be cleansed from the yeast; and for this purpose it is either run into smaller vessels, such as casks or rounds, or the yeasty head is skimmed off from the top, and this is repeated at intervals until too beer is clean. This operation of skimming is generally confined to the cleansing of ales. The rounds or casks are simply filled with the fermenting beer, and so arranged as to be always kept quite full, with a trough or stillon to catch the yeast as it works out the cooled casks, and also to deposit care must be taken that these casks are carefully cleaned each time of using, particularly in the summer, when the yeast is so liable to become stale and putrid, and to taint the next brewing that may go into them. The beer, being being allowed to settle or clear, is then filled into the casks or kegs, directly into casks as for ale, or run into vats prepared for it. On the large scale a large vessel termed a tank is first used, into which the beer intended to be vatted is allowed to run so as to 15 or 20 gallons, and then the lower portion or bottom, or a further portion of yeast by standing. The beer is by this means also rendered flat, which is necessary for stock or store beer that is to be kept some time before coming into use.
The last operation the beer will have to undergo is the finning or clearing, which is sometimes laid by, so that the tap may sometimes by the publican. The fining material consists of isinglass of various qualities, digested and dissolved in acid beer or sour, and their operation is supposed to be this:—the gelatine or the soluble matter of isinglass is more soluble in cold acid beer than in sound, water, or any fluid containing spirit, and therefore when the finings are added to a well-fermented beer, the gelatine is separated from the medium which held it in solution, and by its separation it agglutinates or collects together all the lighter floating matter which adheres to the beer thick, and ultimately floats to the bottom of the vessel with them, leaving the beer clear and transparent.
The main thing to be observed in all the operations described is cleanliness, without which it is impossible that sound beer, be it ale or pale, can be obtained, no matter how ever so great. Whenever a vessel of any kind is emptied, it should be washed directly with sweet liquor, either cold or hot. If the latter should be found necessary, this will insure the operator against failure from this cause, and will also save the waste of a large quantity of express which is not allowed to harden or become dry. The graft should be coarse cut, or, if crushed by rollers, should have the cuticle broken without destroying or breaking in pieces in the grain; when this is done, the taps should support more freely, and a fine bright wort will be obtained; and if sparing or skimming the water over the goods should be adopted in the after operations instead of mashing, great advantage will arise from the facility with which the worts come down. These observations are especially applicable to malt very fine grinding is desirable; and the roasted malt should be ground as fine as possible, so that it will pass the stones or rollers without caking. The temperatures of the mash-
ing liquors for ale or pale grains may range from 170° to 180° according to the degree of maturity of the grain. When this is done, the worts remaining too long in the coolers, more particu-
larly in summer, it becomes necessary to employ artificial means of cooling by refrigerators, the principle of which is this: a current of cold water flows through a main in one direction, the hot wort is made to traverse in the chains site, either in an inclosed pipe within the liquor main, or
around the exterior of the cooling surface. Various appa-
ratus of this kind have been constructed, but those of Wheel and Gregory, of which the latter, are to be pre-
ferred from the facility of cleanliness thereof.

404
The temperatures for fermentation should range between 56° and 62°; not higher than 60° for ale worts, or above 62° for porter. The attenuation at cleansing will depend in a great measure upon the original gravity of the wort, and whether the beer is for present use or keeping; a very good crioculation is required for present-use ale, and 1-3d for keeping-ale, for porter one-half for present-use beer, and 2-5ths for keeping. If the ale or porter be for exportation, these attenuations should be carried lower and the beer well flattened before bringing down in the casks or vats.

The stages of a healthy fermentation are, first, a creamy scum rising on the surface: this, after a time, begins to curl and becomes frosted in appearance; it then becomes rocky, and the air vesicles which appeared frosted enlarge; it then passes to the size of small bladders, and at a small time the head begins to fall; if the beer be made, the yeasts become more abundant in the mass, the yeastiness increases, and, when ready for cleansing, it has a vigorous, rich, yeasty brown and bladders head. With respect to the yeast employed, great care should be taken to have it fresh, sound, and healthy, otherwise you will never insure a healthy fermentation; and if you have not such yeast by you, send by all means to some other brewers who are at work, and procure some. The yeast, after a time, will wear out and cease to ferment the worts healthily: under these circumstances a change of yeast must be attended, and at times one or two before you can get a change that will suit. The yeast used in setting the fermentation should be about 2 lbs. per barrel, but this will vary with the strength of the beer, the extent of attenuation required, and the quantity of worts that are to be fermented. A reasonable amount of yeast is indispensable in all these operations, and good materials are at all times more economical than inferior articles bought at a few shillings cheaper: a greater extract is obtained and a far superior article manufactured, to the credit of the brewer and the interest of the consumer. With regard to the water, this is not a matter of so much consequence as has been often supposed, provided it is sweet in itself, that is, independently of floating matter. Many persons imagine that the peculiarity of the water in different districts produces the difference in the flavour of the beer brewed; but this is entirely erroneous: good beer may be brewed from hard or from soft water, whether obtained from a well or a river.

BREWING STATISTICS. Beer was first made an excisable article by the parliament in the 15th of Charles I., A.D. 1643. In December, 1660, persons by whom it was brewed for sale were required to pay an excise of 2s. 6d. per barrel on strong beer, and 6d. per barrel on small beer. In the following year the same duties were respectively imposed upon strong and small beer in Ireland; but this duty was not in force until 1695, when the brewers paid 3d. per barrel on strong beer, 9d. per barrel on small beer (to which rates the duties in England had been advanced in 1692), and 2s. per barrel upon \'twopenny ale.' In 1697 the rates were increased in England and Scotland, i.e. 9d. on strong beer, and 1s. 3d. on small beer. A further advance in 1710 carried the rates to 5s., and 1s. 4d. In 1761 the duties were fixed at 8s. per barrel on strong, 5s. on table beer, 1s. 4d. on small beer, and 3s. 4d. on twopenny ale. In 1662 the productions of small beer in England and Scotland, and of twopenny ale in the latter country, were no longer made, and the rates of duty were fixed at 10s. per barrel on strong, and 2s. per barrel on table beer, at which they were continued until October, 1830, when the duties in Ireland and England were wholly reduced. In July, 1823, the legislature had sanctioned the sale of a quality of beer between the two kind last mentioned, to which the appropriate name of \'intermediate\' beer was given, and upon this kind a duty of 5s. per barrel was payable, until 1856.

The rates of duty in Ireland underwent the following alterations:

An attempt was made in 1866 to impose duty upon beer made in private houses, but this measure met with so much opposition, that it was abandoned by the chancellor of the exchequer, and the impost was confined, as it always had been, to beer brewed for sale by public brewers.

The quantities charged, and the gross amount of duty collected, in each of the three divisions of the kingdom at different periods since 1786, until the year preceding the repeal of the tax, were as follows:

The beer of all sorts, made in foreign countries, is liable to a duty of importation of 5s. per barrel, which amounts to a total prohibition.

The exportation of beer from this kingdom is very inconsiderable when compared with the quantity consumed. The shipments during the five years from 1830 to 1834 were:

<table>
<thead>
<tr>
<th>Year</th>
<th>Total Shipment</th>
</tr>
</thead>
<tbody>
<tr>
<td>1830</td>
<td>300,976</td>
</tr>
<tr>

</tr>
</tbody>
</table>

Nearby three-fourths of the shipments are made to British colonies and possessions. Of this proportion India takes one-fourth; an equal quantity is sent to the British North American colonies and the West Indies; the remaining one-fourth is divided between our Australasian and African settlements. The United States of America, Russia, and France are the best customers for this article; the remaining shipments are small in amount.

BREWED. [STAFFORDSHIRE.] BRIAN, surname BOORMISHE (Boru), a celebrated king of Ireland, son of Kennedy, king of Munster, son of Lorcan. He ascended the throne of both Munsters, i.e., of Ormond and Thomond, or the present counties of Tipperary and Clare. A.D. 978. His earlier exploits were against the Danes of Limerick and Waterford; but being elated by frequent successes against these invaders, he disposed O'Maelachaghlin, the supreme king of the island, and eventually became himself monarch of Ireland. He derived his surname from the tribute which he now imposed upon the provinces. The Boroihe, or tax eluted to, was levied in the following proportions—from Connaught, 800 hops; from Tirconnell (the present county of Donegal), 500 mantles and 500 cows; from Tirone, 60
loads of iron; from the Clan Rory of Ulster (the present counties of Down and Antrim), 150 cows and 150 hogs; from Orrel (the present counties of Armagh and Monaghan), 160 cows; from the prov. of Leinster, 300 cows, 300 hogs, and 300 loads of iron; from the prov. of Connacht, 60 cows, 60 hogs, and 60 loads of iron; from the Danes of Dublin, 150 hogheads of wine; from the Danes of Limerick and Waterford, 350 hogheads of red wine. On these and other revenues king Brian supported a rude but tolerably good road system in Ireland, and in 1167 his minister, King Brian, near the present town of Killaloe, in the county of Clare. He had also castles at Tara and Cashel. Brian continued for many years to rule his dominions with vigour and prosperity, reducing the Danes and subduing their native allies, building and fortifying castles, and making roads and bridges to be constructed, and enforcing the law by taking hostages from all the petty kings of the country. Having however disputed with Maelmora, the king of Leinster, Maelmora revolted, and, inviting a new invasion of Danes to his assistance, eight or ten battle lances, under the command of King Brian fell, after gaining a glorious victory over the united forces of the invaders and revolted natives, on Good Friday, anno 1014. Brian, and his son Murchogh, who fell in the same battle, were buried together in the cathedral of Armagh. Brian's funeral obsequies lasted twelve days and nights, and the possession of the heroic remains was afterwards contested by rival potentates. Brian is said to have defeated the Danes in twenty-five pitched battles; prior to the battle of Clontarf he had confined them to the cities of Dublin, Waterford, and Wexford, and the great blow which he gave their power in that engagement they never recovered. He was the founder of the numerous septs of O'Brien, O or Ua being a distinctive appellation not assumed by Irish families till after his time. This national prefix means 'descendant of' or 'of the king's line of', and was originally supplied by the more antient Mac, which means 'son.' (O'Connell, Rem. Hib. Scrip. Vet.; MSS. History of Ireland, lit. R. I. Academy.)

Briannach, a fortified town of France, and capital of an arrond. in the dep. of Hautes Alpes, is situated quite among the Alps, 7 or 8 m. from the pass of Mont Genèvre; and at the junction of the small stream the Giuasce with the Durance. It is on the road from Paris by Lyon and Grenoble, and from Paris by the N. lat. 47° 54' E. long. It is 4285 ft. above the level of the sea.

This little town, which is mentioned by Strabo, and in the Itineraries, appears in them under the name Bragiamnum. In the middle ages it was the chief piece of a district, comprehended in what is now France, and not appearing to have been of any note till the early part of the last century, when, by the cession of some parts of the Briancons to Savoy, it was determined to strengthen it as a frontier town with new fortifications.

The town of France, with narrow streets, but neither badly laid out nor badly built. There is a pretty good place or square, and a tolerably well built church. The inb. (about 2000 for the town, or 3000 for the whole comm.) are engaged busily in trade in hosieries, cotton goods, lace, etc.

Its defences, which are very strong, consist mainly of seven forts, which occupy in the most advantageous manner all the surrounding heights. The works are partly formed from the rocks on which they stand. The Durance flows in a very deep valley, and there are seven bridges over the river. The roofs of the forts: over this ravine a bridge of one arch, of about 128 Eng. ft. span, and nearly 180 ft. high, was thrown in 1734.

The surrounding districts sends out every winter into the neighbouring dep. a number of emigrants, who exercise the profession of schoolmasters; they speak and write French tolerably well, understand the four rules of arithmetic, and sometimes Latin. The kitchens of the Catholic priests commonly serve them for schoolrooms. Some coal is dug here; the malts are of good quality. The arrond. of Briançon had, in 1832, a pop. of 29,565.

Brianisk, a. t. of Great Russia, in the government of Orel, and the chief place of a circle of the same name. It is an antient and well-built town, situated at the entrance of the Oka, into the Dona, surrounded by a wall of earth, and contains 16 churches (9 of stone and 7 of wood), a monastery with a seminary attached to it, 2 poor-houses, about 690 houses, and about 5700 inh. On account of the excellent ship-timber which the neighbouring country produces, there is an admiral-office here. It likewise possesses a foundry for cannon, several tanneries, and a considerable trade with the Black Sea, Baltic, and other quarters in grain, hemp, rape-oil, honey, wax, linens, timber, castron iron and iron ware, masts, ropes, bark, tar, lime, alabaster, etc.

Some time or other a factory of arms was established in the neighbourhood. 53° 21' N. lat., 34° 19' E. long.

Briare, a small town in France, in the dep. of Loiret, on the right bank of the Loire, 98 m. nearly due S. of Paris. The town has little in it worthily of notice. It consists of one straight and tolerably handsome street. The inb. by the census of 1833 were taken at 2243 for the town, and 3730 for the whole comm.; they are mostly engaged as boatmen on the riv. or canal.

The can. of Briare deserves notice from its position and importance in the system of inland navigation in France, and from its having preceded in its formation most other works of a similar nature in that country. It was commenced in the reign of Henry IV., under the enlightenment of that great minister the work was interrupted. It was resumed in 1639 in the reign of Louis XIII., by two private individuals, M. Guyon and Boutereur, to whom the king granted the can., its works, so far as they were executed, and all the materials they might find on the spot. The can. unites the Loire at Briare with the Loing at Montargis; and as the Loing was rendered navigable from this point to its junction with the Seine, the can. opened a communication between the various towns and districts watered by the Loing and the Loire, and the capital. For a long time the tolls arising from the can. were very considerable, but they were much diminished by the formation of the can. of Orleans, which opened a readier communication between the Loing and the middle and lower part of the Loire.

Bribary, in criminal law, signifies, denoting, first, the offence of a judge, magistrate, or any person concerned judicially in the administration of public justice, receiving a reward or consideration from parties interested, for the purpose of procuring a partial and favourable decision; secondly, the receiving, by a public ministerial officer as an inducement to him to act contrary to his official duty; and thirdly, the giving or receiving of money to procure votes at parliamentary elections, or elections to public offices of trust.

By the Athenian laws the first of these offences rendered the receiver liable to a penalty of ten times the value of the bribe received, and the punishment of infamy; and the person offering the bribe was also subject to prosecution and punishment. By the Roman law there were various provisions against bribery, and by the Code Napoleon the election to the higher offices in the state, as consul, praetor, &c. This offence was expressed by the term Ambitus, against which there were very numerous enactments. By the Lex Aurelia Calpurnia (s. 69) a man convicted of bribery (where the bribe was disabled by law) was punished from entering the senate, besides being fined: these penalties were extended by the Lex Tullia (s. 64), passed in the consilium of Cicero. (See the Oration pro Murena, which is a defence of Sully; but upon the report of that great minister the work was interrupted. It was re-seen in 1639 in the reign of Louis XIII., by two private individuals, M. Guyon and Boutereur, to whom the king granted the can., its works, so far as they were executed, and all the materials they might find on the spot. The can. unites the Loire at Briare with the Loing at Montargis; and as the Loing was rendered navigable from this point to its junction with the Seine, the can. opened a communication between the various towns and districts watered by the Loing and the Loire, and the capital. For a long time the tolls arising from the can. were very considerable, but they were much diminished by the formation of the can. of Orleans, which opened a readier communication between the Loing and the middle and lower part of the Loire.

Bribary, in criminal law, signifies, denoting, first, the offence of a judge, magistrate, or any person concerned judicially in the administration of public justice, receiving a reward or consideration from parties interested, for the purpose of procuring a partial and favourable decision; secondly, the receiving, by a public ministerial officer as an inducement to him to act contrary to his official duty; and thirdly, the giving or receiving of money to procure votes at parliamentary elections, or elections to public offices of trust.

By the Athenian laws the first of these offences rendered the receiver liable to a penalty of ten times the value of the bribe received, and the punishment of infamy; and the person offering the bribe was also subject to prosecution and punishment. By the Roman law there were various provisions against bribery, and by the Code Napoleon the election to the higher offices in the state, as consul, praetor, &c. This offence was expressed by the term Ambitus, against which there were very numerous enactments. By the Lex Aurelia Calpurnia (s. 69) a man convicted of bribery (where the bribe was disabled by law) was punished from entering the senate, besides being fined: these penalties were extended by the Lex Tullia (s. 64), passed in the consilium of Cicero. (See the Oration pro Murena, which is a defence of Sully; but upon the report of that great minister the work was interrupted. It was reœ
doth offer it.' (32 Edw. III. 1381.) Sir William Thorpe, then chief justice of England, was found guilty, upon his own confession, of having received bribes from several great men to stay a writ which ought to have run in due course of law, and to be withheld against them. For this offence he was condemned to be hanged, and all his lands and goods forfeited to the crown. Blackstone says (Comment, vol. iv. p. 140) that he was actually executed; but this is a mistake, as the record of the proceeding shows that he was almost immediately released and restored to all his lands (33 Edw. III. 1346). It appears also from the Year Book (28 Ass. pl. 2) that he was a few years afterwards reinstated in his office of chief justice. The case, therefore, does not speak so strongly in favour of the purity of his conduct as many writers, following Blackstone, have supposed. In truth, the corruption of the judges for centuries after Sir William Thorpe's case occurred as notorious and unquestionable. It is noticed by Edward VI. in a discourse of his pustle and on some records and against the lawyers of his time. (Burne's Hist. of the Reformation, vol. ii. App. p. 72.) Its prevalence at a still later period, in the reign of James I., may be inferred from the caution contained in Lord Chancellor Bacon's address to Sergeant Hatton upon his becoming a judge, 'that his hands and the hands of those about him should be clean and uncorrupt from gifts and from serving of turns, be they great or small ones.' (Bacon's Works, vol. ii. p. 632, edit. 1765.) In Lord Bacon's own confession the charges of bribery were these: 'The Horrific Laws of England have been overthrown by way of palliation, to the offence of judicial corruption as being vitium temporis. (Howell's State Trials, vol. ii. p. 1104.) Since the Revolution, in 1688, judicial bribery has been altogether unknown in England, and no case is reported of any law books in which this offence has been imputed to a judge in courts of superior or inferior jurisdiction.

II. Bribery in a public ministerial officer is a misde- meanor of common law, and a person who takes and also in him who offers the bribe. Thus a clerk to the agent for French prisoners of war at Porchester Castle, who had taken money for procuring the exchange of certain prisoners out of their turn, was indicted for bribery and se- verely fined. (42 Ric. II. 1390; 47 Ric. II. 1396; 11 Ed. IV. 1472; 26 Ed. IV. 1482; 32 Edw. III. 1381; 33 Edw. III. 1346; Reports, 183.) So where a person offered the first lord of the treasury a sum of money for a public appointment in the colonies, the Court of King's Bench, in Lord Mansfield's time, granted a criminal information against him. (4 Burr. 91.)

Bribery with reference to particular classes of public officials has become punishable by several acts of parliament. Thus by the stat. 6 Geo. IV. c. 106, sect. 29, if any person shall give, or offer, or promise any bribe to any person employed in the service of the crown, he shall in any way to neglect his duty (whether the offer be accepted or not), he incurs a penalty of 500l. So also by 6 Geo. IV. c. 108, sect. 35, if any officer of the cus- tomes, or any officer of the army, navy, marines, or other person employed by or under the authority of the commis- sioners of the customs, shall make any collusive seizure, or deliver up, or agree to deliver up, or not to seize any vessel, or goods liable to forfeiture, or shall take any bribe for the neglect or nonperformance of his duty, every such officer being incapable of serving his Majesty in any office whatever, either civil or military; and the person also giving or offering the bribe, or making such collusive agreement with the officer, incurs the like penalty. By the 6 Geo. IV. c. 80, sect. 145, similar penalties are inflicted upon officers of the excise who take bribes, as well as upon those who give or offer the bribe.

III. As to bribery for votes at elections to public offices.

1. Bribery at parliamentary elections is said to have been almost unknown; and no evidence of any prosecutions for bribery of this kind until particular penalties were imposed upon the offender by acts of parliament. The operative statute upon this subject at the present time is the 49 Geo. III. c. 118, which provides that if any person shall give, directly or indirectly, or shall promise or agree to give any sum of money, gift, or reward, to any person upon any engagement that such person to whom such gift or promise shall be made, shall by himself or by any other person at his solicitations pro-
cure, or endeavour to procure, the return of any person to serve in parliament for any place, every such person so giving or promising (if not returned) shall for every such gift or promise forfeit the sum of 1000l.; and every such person receiving, taking, or accepting any such promise upon any such engagement, shall be disabled and incapacitated to serve in that parliament for such place; and any person or persons who shall receive or accept of any such sum of money, gift, or reward, or any such promise upon any such engagement, shall forfeit the amount of such sum of money, gift, or reward, over and above the sum of 500l. (Elections.)

2. Bribery at municipal elections was also an offence at common law, and a criminal information was granted by the Court of King's Bench to a privy councillor of Tiverton for giving a sum of money to a member of the corporation of Tiverton to induce him to vote for a particular person at the election of a mayor. (Plympton's case, 2 Lord Raymond's Reports, 1637.)

The 54th clause of the recent act for the regulation of Municipal Corporations in England and Wales (5 and 6 Will. IV. c. 76) provides that if any person who shall have, or claim to have, any right to vote in any election of mayor, or of a councillor, auditor, or assessor of any borough, shall take or offer any money or other reward, or any promise of money or other reward whatsoever, to give or forbear to give his vote in any such election, or if any person shall by any gift or reward, or by any promise, agreement, or security for any gift or reward, corrupt or procure, or promise or agree to corrupt or procure the vote in any such election, such person so offending in any of the cases aforesaid shall for every such offence forfeit the sum of 504l., and for ever be disabled to vote in any municipal or parliamentary election whatever in any part of the United Kingdom, and he shall be liable to be addicted to hold any office or franchise to which he then shall or at any time afterwards may be entitled as a burgess of such borough, as if such person was naturally dead.

BRICK, clay, or terracotta, and the ashes and particles of small coal sifted, and afterwards burnt in a clay oven, or clay mixed with sand, or clay alone, baked in a kiln. The antients both baked their bricks and dried them in the sun. Among the oldest specimens of bricks are those found in the ruins of the temple of Jupiter (Palatine Brink, or Antonii Palatini). The Egyptians used sun-dried bricks in the large walls which inclosed their temples, and in the constructions about their tombs. At Thebes there are true arches made of sun-dried bricks: pyramids also were sometimes built of these bricks. The Romans, as well as the Greeks, took the brick as a material, and settled in the plain of Shinar, consisted of clay and chopped straw. The Egyptian manner of making bricks is delineated in Rosellini's work on the paintings of Egypt. The Romans, according to Pliny, began to use bricks about the aediles of the 7th consulship of C. Scribonius, and it was used in the temple of the god Hadecolus, still remains, which is said to have been built on the occasion of the retreat of Hannibal. (Rosini Vista in Roma.) It has been supposed that the Greeks did not employ bricks until after their subjugation to the Romans, as none of the works erected prior to that period, the ruins of which still exist, show any signs of brickwork; yet there are Greek buildings mentioned by Vitruvius as built of brick, which may have been prior to that date. Vitruvius (lib. ii. cap. 7) mentions the wall of Athens towards the Piraeus, and a wall of brick built of the cells of the temples of Jupiter and Hercules; and indeed it would be easy to show from various passages that bricks were in use among the Greeks before the Roman con- quest. (Demosophiens, stri sophiens, c. 163.) The Greek names for bricks were diroros, penta doros, pentadroma, from the Greek doros, a hand-breadth. Pentadromas are bricks five dora, and tetradromas bricks four dora on each side. All these bricks were also made half the size, to break the joint of the work; and the long bricks were laid in one course, and the short in the other. (Demosophiens, stri sophiens, c. 163.)

Vitruvius says the pentadromas were used in public works, and the tetradromas in private. It is most probable that they were dried bricks, as Vitruvius speaks of bricks requiring two years to dry. We must, however, believe him, that the laws of Attica required that five years should be allowed for the drying of bricks. It is true they might when well dried be burnt; but when he says (vol. i., cap. 3) that 'if they are used when newly made, and moist, the plaster work which is laid on them remaining firm and stiff, and they
shrinking, and consequently not preserving the same height with the incrustation, it is by such contraction loosened and separated; we must infer that they were not made in the manner still used at Pisa, and in many parts of Germany. Vitruvius says that they should not be made of ‘sandy, stony, or gravelly loam, for such kinds of earth in the first place render them heavy; and secondly, upon long standing in the sun and rain the castellate round in the wall, swell and dissolve, and the straw which is put in them does not adhere on account of its roughness.’ The earth which Vitruvius recommends is white and chalky, or red, with a coarse grit; and the spring or autumn, according to him, is the best time for doing the thing.

The Roman brick used in the buildings on the Palatine hill, in the baths of Caracalla, and in various remains of Roman buildings in England, is more like a tile than a brick, being very thin compared with the length and breadth. The thickness of Roman bricks vary, 7 3/4 inches square and 1 1/4 inches thick, 16 1/4 inches square and 2 1/4 to 3 1/4 inches thick, and 1 foot 10 inches square by 2 1/8 inches thick; the color is red. The bricks of the small temple without the walls of Rome, on the road leading to the grove of the Esquileen, are smaller than any of these dimensions, being in size and colour more like a Dutch clinker. In the villa Diva Pamphilii at Rome, among the tombs, are several kinds of bricks not usually found elsewhere. There are large red bricks with a rough projection of small edifices; some are triangular, and others are thicker than the ordinary brick, though not so long or so wide; and a fourth sort approaches to the size of the tetra-

dorons.

In Persia bricks are both dried in the sun and baked. The sun-burnt bricks are made in wooden moulds. When formed they are 8 inches long, 6 inches wide, and 24 inches deep. The earth is tempered with the feet, and, like the Egyptian brick, is mixed with straw cut fine. While in the mould, they are chopped in a red-coated raw, mixed with chopped straw, and then smoothed by hand; the moulds are then removed, and in about three hours they get sufficient consistency to be handled, when they are placed in rows on the other to get thoroughly dry. The clay when burnt, much like the English clap-burned bricks (Chardin).

The brick used in England is made of clay mixed with sand or with ashes, and after being dried in the sun and air, is burned in a clamp or baked in a kiln. These bricks, which are moulded of one size throughout the kingdom, are 10 inches long, 5 inches wide, 3 inches thick, as prescribed by an act of Parliament. Bricks may be made of any size, but all above the standard size pay a higher duty. They are made in the following manner: The encallow, as it is called, is turned off and the top-soil, mixed with ash, is put on one side. The clay is then dug and turned over in the winter, and being prepared for the spring by this exposure to wet and frost, it separates and mixes better with the fine ashes which are afterwards added in the proportion of one-

fifth of ashes to four of clay, or 50 children to 240 cubic yards, which will make 100,000 bricks. When much sand is mixed with the clay, and the earth is what is technically called mild, 40 chaldron of ashes to 230 cubic yards of clay will make the same quantity. To burn the former, or stiff clay, the ashes (after the coal-ash left from the sitting) are required; for the latter, or for the mild earth, 12 will be sufficient. In the spring and summer, the earth, which has been in the winter, has a coat of ashes laid over it to the depth of three inches, and this coat of ashes with a foot of clay is mixed together, the digger taking care to mix his ashes equally with the clay. The clay and ashes thus mixed together are watered down, by water being thrown over them with a wooden scoop. The clay and ashes are then mixed together more and more, and a heap is made of a pile, which, when ready to be burned, is laid towards the wind. The heap is then taken to the kiln, which is then covered with straw, the kiln in the ground, and in about three hours they get thoroughly dry. The kiln (as the clamp is called) must be managed with considerable skill to burn off the bricks successfully, for if too much firing or too little is used, they become either one mass of clinkers or are all soft. They should also be carefully and closely packed, so as to leave as little air as possible, for the admission of air produces the red soft kind, called place bricks. The base of the kiln is made of brick rubbish, and laid a little inclined, in a segment of a circle from north to south. In England, N., so that the north end is higher, which is the usual and, as I believe, the most practical support. The bricks are placed in lots or ‘necks,’ very deep in each neck, and as long as may be. The erection of the clamp commences in the centre; the central neck is perpendicular, and is called the upright, towards which all the other necks incline. The bottom end is cut off, and the upper part of the barrel, that is, the upper third of the barrel, has six teeth of iron, three above and three below. At the bottom of the barrel is a small hole, through which the masticated clay is forced by the grinding of the teeth produced by the motion of the horse.

The clay has been mixed in pieces with a concave shovel, called a ‘cuckold,’ and laid on one side and covered with sacks to prevent the sun drying it before it is carried to the moulder. From this stock the clay is supplied to the feeder, who stands next to the moulder. The feeder does not lean upon the barrel, but is about the size of the brick, which the moulder throws into the mould first sanded, striking it sometimes with his wrist: he then cuts off any superfluous piece with a stick kept in a bowl of water by his side. The back and side parts of the mould are removed from the bottom piece, and the brick is gently deposited on a flat piece of wood, called a pallet-board, which is removed by a boy to a lattice-work inclined plane fixed to a barrow. When this is full, the upper surface of the bricks is sanded, and they are wheeled off to the kiln, which is at a great distance from the field, and are placed on the face of the field, and formed about two feet six inches wide. Here they are carefully deposited, the bricks being held by the workman performing this duty, who is called the off-bearer, by means of two pallet-boards. The bricks being thus brought to one of the kilns, a skilful hand they become twisted in the setting down. The bricks are placed in two rows on the edges, and are set a little apart to admit the air to dry them. At each end of the heap over every other layer of bricks is turned with the mute, which is cut at the rows and carried in rows, one on the other, to the height of seven bricks, but the average height in most fields is eight. As they are put down the workman counts them by thousands, making a dot at every thousandth in the soft brick, so that they may be included. From the top they are covered with straw, which is removed when it is not showery: they are always covered up at night in this way. Some brickmakers have their pallets covered with long shreds, but this has been found very expensive, and a very slow method. After the bricks are partially dried, another operation takes place, called ‘skilling,’ that is removing the bottom bricks to the top, and widening the apertures between each brick, placing them diagonally. This, which hastens the drying, cannot be done until the bricks have been sufficiently dry. The brick is cut off by the knife, the kiln, the soil, and the edges are burned off. In removing to the kiln. The kiln (as the clamp is called) must be managed with considerable skill to burn off the bricks successfully, for if too much firing or too little is used, they become either one mass of clinkers or are all soft. They should also be carefully and closely packed, so as to leave as little air as possible, for the admission of air produces the red soft kind, called place bricks. The base of the kiln is made of brick rubbish, and laid a little inclined, in a segment of a circle from north to south. In England, N., so that the north end is higher, which is the usual and, as I believe, the most practical support. The bricks are placed in lots or ‘necks,’ very deep in each neck, and as long as may be. The erection of the clamp commences in the centre; the central neck is perpendicular, and is called the upright, towards which all the other necks incline. The bottom end is cut off, and the upper part of the barrel, that is, the upper third of the barrel, has six teeth of iron, three above and three below. At the bottom of the barrel is a small hole, through which the masticated clay is forced by the grinding of the teeth produced by the motion of the horse.
breeze; the flies is then overpowered. The clamp when full is surrounded with old bricks, or the drier of those newly made, and on the top of all a thick layer of breeze is laid. The external bricks are coated with a thin plastering of clay to exclude the air, and if the weather prove wet, the kiln is protected by an umbrella made by a stick and broom. The fire is lighted at the mouths of the flues, which are called the live-holes. If the fire burns well, the mouths of the flues are stopped. In favourable weather the bricks will be burnt in about twenty-five or thirty days, but it is not to be noted a load of burnt past is so soon, as the bricks become speckled when the ash on. the surface is not quite consumed. Bricks only partially burnt are called burnovers, and are put into the next clamp. The bricks are now separated for sale; the hard sound stocks are the best, and are filled by the buyers. Some will be broken up into inferior soft red brick from 11 to 12 10s.; and the clinkers or burners, black-looking masses of vitrified brick, are worth about 10s. a load. When burnt they are on an average 9 inches long, 4 1/2 wide, and 3 1/4 thick. Kid-brick and marl bricks, as well as those which have differ from the bricks just described. The kiln is burnt; a baker may be either baked or burnt; they take their name from the marl originally used in them, which has now given place to chalk. The Dutch clinkers are small hard yellow bricks, not much used for building purposes. And in furnaces, boilers, cisterns, vaults, stables, and yards. Besides these kinds there is capping or coping brick, for surfacing fence walls, which is made both angular and semicircular to the other of the wall. A larger sort of brick, 12 inches long, 6 broad, and 3 1/2 thick, called wall-brick, is made in fent, the indented works under the coping of walls built with large bricks; a circular brick, called compass-bricks, is used for wells; hollow or draining bricks are flat on one side and hollow on the other; fire bricks, called also Windsor bricks, are 12 inches thick, are of a yellowish red, and are used for a long time a fierce fire; common paving bricks are of the same size as Windsor bricks; feather-edged bricks are the same size as the common brick, except that they are thinner; they are used on eddies, etc. In this brick, indented every 12 inches, have the clinkers thrown together in one mass. Bricks having a smoothed or glazed surface are sometimes made; this is done in the burning.

Mr. Lees discovered that certain proportions of chalk and loam, treated in the usual manner, made a good substitute for the clinkers. He offers the following proportions of the materials at the time since, which, having expired, his practice is now very generally adopted round London. These bricks, however, are not considered to have either the fine colour of the London marl stock, or the beautiful stone-coloured hue of the Northern clinker. The way of making them is the same as described by Mr. Nicholson:

A circular recess is built, about four feet high, and from ten to twelve feet in diameter, paved at the bottom, with a horse wheel placed in its centre, from which a beam extends to the outside of the horse to form it by. The horse is then raised to a level with the top of the recess, on which a platform is laid for the horse to walk upon. This mill is always placed as near a well or spring as possible, and a pump is set up to supply it with water. A harrow made to fit the internal part of the mill is fixed to the end of the beam, well loaded, is chained to the beam of the wheel to which the horse is harnessed. Previously to putting the machine in motion, the soil, as prepared in the heap in the ordinary manner, is brought in barrows, and distributed regularly round the edge of it. In the addition of a barrel of water; the horse then moves on, and drags the harrow, which forces its way into the soil, admits the water into it, and by tearing and separating its particles, not only mixes the ingredients, but also affords an opportunity for the air to absorb the moisture. The fine soil and water continue to be added till the recess is full. On one side of the recess, and as near to it as possible, a hollow square is prepared, about eighteen inches or two feet deep. The soil being sufficiently dry, it is spread and passed, and the siliceous, or, as it is called, the coarse, is laded out of the recess, and, by means of wooden troughs, conveyed into this square pit; care being taken to leave the sediment behind, which is afterwards to be cleared out and thrown on the sides of the recess. The fluid soil diffuses itself over the hollow square or pit, where it settles of an equal thickness, and remains till wanted for use, the superficial water being either evaporated or drained away by exposure to the atmosphere. When one of these square pits is full, another one is filled, and the first is emptied. The earth so prepared is likely to be wanted for the season.

It should be observed, that bricks burnt in the clamp have the ashes mixed with them, and the firing is actually in the brick; but those burnt in a kiln have no ashes mixed with them, and the fires are applied only on the top. Kilns for burning bricks are constructed of various sizes. They are sometimes conical or domed; some are square-built with brick piers, and covered with tiles. A kiln thirteen feet long, ten feet six inches wide, and twelve feet high, will contain about 1400 squares of bricks, and about 1500 squares of walls, in a kiln are about fourteen inches thick, and incline downwards towards the top.

About the year 1795 a patent was obtained for making bricks on a new plan. This brick was like the common red brick, except that it is liable to more or less injure the sides of the groove, each of which would be nearly equal to one-quarter of the width of the side of the brick, or to one-half of the thickness. By this improvement, a greater surface of the first course would fall into grooves of the first course, and the shoulders of the first course would fall into the grooves of the second; and so on with every succeeding course. Buildings constructed with this kind of brick will require no bond timbers, as a universal bond runs through the whole building, and holds all the parts together.

A patent, obtained by Mr. Bayliss of Manchester, for making the clay-tempering machine has lately been invented by Mr. Bayliss of Manchester. By the clay-tempering machine the clay is mixed with the water employed in the clinker by any method hitherto employed; and by the use of the moulding machine the porosity of the bricks is in a great measure destroyed, the pressure employed in the moulding being equal to three tons weight. The machine for confining the brick in a compact mass is formed of a series of thin pieces of leather, each piece being cut to produce a great pressure, the result of which is the compression of the clay into the greatest compactness and utmost accuracy of form. The mould employed opens on a hinge at one of its angles, and closes by a spring latch. (For further particulars, see The Mechanics Magazine, May 14, 1831.)

A patent has been taken out by Messrs. Rhodes for a brick in which its coke ashes are introduced, finely pulverized by means of a mill with French stones (similar to those used in a mill to grind corn), and are mixed with the clinkers by any method hitherto employed; and by the use of the moulding machine the porosity of the bricks is in a great measure destroyed, the pressure employed in the moulding being equal to three tons weight. The machine for confining the brick in a compact mass is formed of a series of thin pieces of leather, each piece being cut to produce a great pressure, the result of which is the compression of the clay into the greatest compactness and utmost accuracy of form. The mould employed opens on a hinge at one of its angles, and closes by a spring latch. (For further particulars, see The Mechanics Magazine, May 14, 1831.)

The duty on bricks was first laid in 1784, at 2s. 6d. a thousand. In March, 1794, an additional 12. 6d. per thousand was laid on bricks. On the 4th July, 1803, the duty was increased to 5s., and in March, 1825, a further duty of 12. 6d. per thousand was added. On the 4th July, 1803, a duty of 10s. per thousand was laid on all bricks of larger dimensions than the common bricks. Polished bricks are charged a duty of 12. 10d. a thousand: large polished, 24s. 2d. do. The words of the Act referring to glazed bricks and tiles were omitted. Polished bricks are charged a duty of 12. 6d. per thousand. The officers, that bricks struck with a bat or on a table to straighten them, if warped, have been called smooth and polished, and charged the extra duty. The following is a list of the account of the quantities charged with excise duties in Great Britain for the three years ending 1834. (Government Statistical Tables, 1834.)

The curved line at the bottom given by the camber-slip is cut by means of the bevel; every angle of each brick being different, they are copied by the bevel, and set off in succession on the mould and numbered, so that for the rest of the operation, the workman has only recourse to the mould.

A larger, or what is called an irregular segment is cut in the same manner. A semicircular arch being struck from one centre requires but one mould, without the aid of the bevel, as all the bricks are alike and have their ends at the same angle. At either end, it should be observed, are constructed on centerings of wood. In straight arches the camber-slip answers the purpose of a centre.

Elliptical arches are cut like straight and semicircular arches, the ends like semicircular arches, and the centre like camber arches.

Corbelling, or a projecting of brickwork, is often practised to gain space for flues and over corners of narrow streets.

In stepping walls it is usual to employ brickwork where the soil is loose. For this purpose a centre is required, made with circular rings of wood bored round the outside; upon these rings the bricks are laid. As the digger excavates the ground, the centre with the brickwork sinks and another is laid upon it till the whole work is completed.

Mortar is applied between the bricks, and as soon as the next segment brickwork. This cement is composed of lime, grey or white, but grey or stone lime is the better; it is mixed with river sand, sea sand, or road sand, in the proportion of one of grey lime to two and a half of sand, and one of white or chalk lime to two of sand.

In dry weather and for firm work the best mortar should be used, and the bricks should be wetted or dipped in water as they are laid, which makes them adhere firmly to the mortar. Brickwork in drains and foundations, where it is likely to be broken up, is made with a cement composed of a mixture of three parts of mortar to one of bricks, and after the first 6 or 8 inches are laid, the stone is cut with a wire and the brickwork is finished by regular courses.

When new walls are to be built to old it is usual to cut a chaise or draw a brick at every other course in the old work and tooth in the new work. When it is intended to add walls to other buildings these toothings are left. The flues for chimneys are twisted to prevent their smoking [see House, in which a drawing represents a stack of chimney flues as built in London]: they are always chalked on the wall of a house to which another is intended to be added. The following are the substances of brick walls, as required to be built in London according to the Building Act of 14 Geo. III. c. 78.

In first-rate buildings the external walls are directed to be built of two bricks' length in thickness to the ciling line of first floor, and the party walls in the basement two and a half bricks, and from these to the gutter two bricks. In second rate buildings the party walls are two bricks and a half thick in the basement, and two
Holland is very accurate. There are many curious brickfronts in Germany, especially in Hanover, and some architectural display in brickwork appears in several of the smaller Italian towns. But the most singular and beautiful brickwork is found in North Prussia, in the Marien Kirche at Brandenburg, the castle of the Teutonic knights, and a number of other places.

Brickwork was not common in London until after the great fire of 1666. There are early specimens of brickwork in some of the old baronial mansions, in which the chimneys are the most conspicuous features. But few of these houses are of greater antiquity than the time of Henry VII. and VIII.; and most of them date about the reign of Elizabeth. Hampton Court, built by Cardinal Wolsley, is a specimen of good antient English brickwork. One of the most elaborately carved specimens of English brickwork is on which was built, in the time of Elizabeth, the house of Sir Thomas Wymondham, in Norfolk, which is in the early Italian style covered with grotesque ornaments. The practice of carving cornices, &c. in brick continued till about a century ago, when it ceased, owing to the more frequent use of stone. Inigo Jones used brick moulded cornices in some of his structures.

BRIDEWELL, a name frequently given to houses of correction. The cause of its being so applied may be traced to the following circumstances. Before the Reformation, at St. Bride's, there were in the church three sepulchral monuments termed 'holy wells,' whose waters were supposed to be endowed with peculiar virtues if taken at particular festivals or other times. Some of them in reality were medicinal springs. St. Bride's was a great church and parish. It was situated at the corner of Fleet Street, and the churchyard had a long and picturesque history. The vicar of this cell Edward VI., founded a hospital, which was afterwards converted into a receptacle for disorderly apprentices, in fact, into a House of Correction. The boys were distinguished by a particular dress, and were in the habit of attending a theatre with an aggregate company of an hospital. In 1755 a report was made to the governors respecting the unruly conduct of the 'Bridewell boys.' Their turbulence in the streets had become a great annoyance to peaceable citizens. From the time their peculiar costume was laid aside, by the general consent and improvement, Bridewell Hospital is at present used as a receptacle for vagrants committed by the Lord Mayor and sitting aldermen; for apprentices sentenced to solitary confinement; as a temporary lodging for persons previous to being sent home to their respective parishes; and a certain number of boys are brought up to different trades. Houses of correction in different parts of the country which are called bridewells are so called in consequence of the hospital in Blackfriars having been the first place of confinement in which penitentiary amendment was a leading object.

BRIDGE, a construction of stone, wood, brick, or iron; consisting of piers, with either horizontal beams laid from one to the other, or with arches between the piers, on which a road-way is formed for passengers and vehicles. Pavements are elevated on each side of the road, and foot pavements, called banquettes, are raised for people on foot.

There are still remaining bridges of great antiquity built by the Romans, but we are unacquainted with the earliest history of some of these examples. Among these old bridges which may have taken their ideas from natural works similar to the bridge of Icononzo, in South America, or the Rock Bridge in Virginia, or from bridges formed by the fall of trees across small brooks and rivulets. There is no instance of a bridge in the Old Testament. Perhaps the oldest historical record of a bridge is that of the bridge of Semiramis, at Babylon [BABYLON], which consisted of piers, with beams laid horizontally from pier to pier. Some Chinese, and some South American bridges are made by the hands of natives; in the bridge over the Desaguadero, for example, are novelties in this kind of construction; the arch of the former being constructed of two pieces of stone cut to a quarter of a circle; and the latter being large suspension bridges made of rushes. There is a large number of bridges, especially in bridge-building by means of arches. The bridge of Foutcheou-fou, the capital of Fo-kien, has more than 100 arches. A Tauen-techeou-fou is a bridge with 300 stone piers built with angles to the river. The bridge at Suan-tekeou-fou, a shallow estuary, is 2500 Chinese feet in length and 20 in breadth. The road-way of this bridge is laid

horizontally with huge blocks of stone on 252 stone piers, and on these other stones are laid across. The city of Chao-king, like some of the Dutch towns, has numerous canals, and in consequence numerous bridges, for the most part of one arch, and rising very high. At Tansu there is a freestone bridge of seven arches, the centre arch of which is about 46 feet wide. Chinese bridges have pointed, semicircular, polygonal and semi-elliptical arches. Their construction, which is curious, is described by Mr. Barrow. (See also Drucker, vol. i., pp. 21, 257, and the Image of the World.) The bridges in South America called bujaco are very narrow, and from the lightness of their materials, and being suspended, they oscillate in a terrific manner. The width of these bridges often does not exceed 4 ft. 6 in. The Taribota bridge, built at the base of the Ababa, opposite the town of Simbour, in the Mibilidade, over which passed the Flaminian way; and the bridge of Hadrian. The Subicibus, an ancient bridge at Rome, was built of wood; but the most remarkable wooden bridge constructed by the Romans was that thrown by Cæsar over the Rhine. It was built with a double row of piles, inclining to the course of the stream, and joined together at two ft. from each other: forty ft. apart from these was another similar row inclined against the stream. Long beams, two ft. thick, were fixed between the piles, and laid fast at each end by two bridges. The bridge was beheld by trees of various pieces. The first double row of piles was protected by other piles beyond them, which served as buttresses, and were designed to protect the piles from timber floating down the stream. (See Cæsar’s Commentaries, translated into Italian by Balbi, with designs by Palladio, Venice, 1575; and also Commentarii, &c., Venetiis, 8vo, 1513, 1519, with a picture of the bridge over the Rhine.) The bridge built by Trajan over the Danube was the most stupendous work of the kind ever constructed by the Romans. (Cass. itin. xvi. c. 13.) It consisted of 20 piers of stone, 60 Roman ft. broad and 150 ft. without the foundations, above the bed of the river; the width between each pier was 170 ft., and the piers were united by arches. The bridge of Narni, which is a fine specimen of Roman work, is constructed over the Nera, where it flows between two precipitous hills. This bridge originally consisted of four arches, three of which are broken. The height of the arches was about 112 ft., and the width respectively 75, 135, 114, and 142 ft. 6 in. The Roman bridge of the aqueduct, now called the Pont du Gard, over the Gard or Gardon near Nîmes, consists of six arches at its base, the whole length being 465 ft.; a second series of arches, above these, extends 780 ft. to the slope of the mountains on each side; above this is a third series of 35 arches, smaller in size, extending 850 ft., which carries the water from the mountains. The entire height of this structure is 190 ft. Another ancient Roman bridge, that of the Tagus at Alcantara, in Spain, consisted of six arches raised 206 ft. above the river: the whole length was 670 ft. and the breadth 38 ft. [Alcantara.] An old bridge, near Bruiss, over the Allier, in the dep. of Haute Loire, consists of one arch, 181 ft. wide, and 68 ft. 8 in. high from the water to the intrados of the arch: the breadth of the bridge is only 13 ft. Two remarkable bridge-aqueducts have been erected in modern times: one at Alcantara, near the city of Lisbon; the other, called the Ponte Maddelenas, near the royal palace of Caserta, in the kingdom of Naples, to supply the fountains in the gardens of that edifice. The structure at Alcantara consists of 35 arches of unequal dimensions. The principal arch is 198 ft. 5 in. wide, and 227 ft. high; the other arches vary from 21 ft. 10 in. in width to 72 ft. The total length of the whole is 2464 ft. The Ponte Maddelena, like the Pont du Gard, consists of a series of arches, one above another, built between the top of two mountains. The bridges erected by the Romans in the provinces served as models for the stone bridges which were erected after the dissolution of the empire, and it is to the conquests of this nation that N. and W. Europe is indebted for the introduction of so convenient a means of internal communication. But the finest examples of bridge architecture, which equal any that the Romans have left, and surpass all others in the world, are the five principal bridges of London—Blackfriars’ bridge, London bridge, Southwark iron bridge, and Westminster and Waterloo bridges.

Many of the Russian bridges are constructed of wood, and in St. Petersburg the principal bridge is of boats. (See the Plan of St. Petersburg, published by the U. K. S.) When rivers have a rapid current, bridges of boats are commonly employed, as over the Po, in Italy. These bridges, called by the French, ponts volants, are readily constructed with a few boats attached to a rope, and moored in the middle of the stream: the bridge is moved by a rudder, and, assisted by the stream, is carried over to the other side. The oldest bridge now existing in England is the Triangular bridge at Croyland, in Lincolnshire, which is said to have been built in 1306, but in 1725 is considered too difficult, if not altogether impossible, to determine. It is obvious that utility was not the motive of the builder, though it may be allowed to claim the qualities of boldness of design and singularity of construction as much as any bridge in Europe. It is formed by three semiarches, whose bases stand in the circumference of a circle, equidistant from each other, and uniting at the top. ‘This curious triune formation has led many persons to imagine that the architect intended thereby to suggest an idea of the Holy Trinity.’ (Nicholson’s Dict.) Old London bridge, which has recently been removed, was the oldest structure of this kind in the city of London; and till about the middle of the last century, was the only means of communication, except by ferries, between Surrey and Middlesex. This bridge was begun in 1176, in the reign of Henry II., and finished in that of John, A.D. 1299. For several centuries it was covered with houses, which were at last removed. The bridge, called Pont y Pridd, over the Taff, near Llantrisant, in Glamorganshire, which was completed in 1755, is a fine work. It consists of a single arch 140 ft. wide, forming the segment of a circle of 175 ft. diameter; the height is 35 ft. A bridge over the Liz, near Dublin, built in 1783, is an example of an elliptical arch 166 ft. wide, which rises only 22 ft. Venice contains a great number of bridges, but with the exception of the Rialto, they are all insignificant. The Rialto was begun in 1588, and finished in 1591, from the designs of M. Angeli. It is 160 ft. wide, and 23 ft. from the water line; the width is 43 ft. This bridge is constructed of white marble, and the foundation is on piles. One of the lightest and most elegant bridges of Europe, the Ponte dell’ Ondine at Florence, ‘Map of Florence,’ published by the U. K. S., consists of three beautiful elliptical
Dresden has a very large bridge of 16 arches over the Elbe. (See the Plan of Dresden, published by the U.K. Society.) Paris contains numerous bridges of stone, wood, and iron; of which the oldest is the Pont Neuf, and the most modern a chain or suspension bridge. The bridges of Paris are not remarkable for their length, nor generally for architectural beauty; most of them are inferior to many of the provincial bridges in England. The longest bridge in England, that of Burton-upon-Trent, is 1445 ft. in length, and has 34 arches.

One great improvement in the practice of bridge-building, in modern times, is the construction of equal arches, by which a horizontal line of road is formed, and the inconvenient rise and fall in the carriage-way of the elder bridges is avoided. The Pont de Neuilly, built between 1768 and 1780, by M. Perronnet, over the Seine, is, we believe, the earliest modern example of this kind of bridge. It has five equal arches, 128 ft. wide, and 32 ft. in height; the piers are 14 ft. thick, and the width of the bridge is 48 ft.; the rise in 33 ft. is not more than 6½ in. In 1771 another flat bridge of 13 semi-elliptical arches was built over the Allier, at Moulins; these arches are 64 ft. span and 24 ft. high. The bridge of St. Maixence over the Oise, and the bridge of Orleans over the Loire, also approximate to a horizontal line in their roadway. The bridge of Orleans is 1100 ft. long. One of the finest flat or equal-arched bridges ever constructed is Waterloo bridge over the Thames, which was built by Mr. Rennie.

Wooden bridges are much more common than bridges of stone, from the greater facility of constructing them of this material, as well as on account of their cheapness. Bridges built of wood, unsupported by upright posts, and sustained only by abutments at the ends, have been termed pendent bridges and philosophical bridges: such was the bridge of three arches formerly in existence at Walton-on-Thames. Palladio has described three methods of constructing these bridges. The small bridge of one arch over the Cam, at the back of Queen's College, Cambridge, is of this kind. Among the wooden bridges of America, the Upper and Lower Schuykill bridges near Philadelphia, and the bridge across the Delaware at Trenton, are perhaps the most remarkable. The chord line of the Upper Schuykill bridge, called the Colosseus, is 340 ft. The Lower Schuykill bridge consists of three arches on stone piers; the centre arch has a chord of 195 ft. and the two side arches 150 ft. each. The bridge over the Delaware at Trenton is a very singular construction of five arches, supported on light stone piers. The chord of the centre arch is 200 ft.; the two arches on each side the centre, 180 ft. and the two abutment arches, 160 ft. each. This bridge was erected by C. A. Busby, in 1819. A very accurately-engraved drawing of it has been published by Messrs. Taylor, of Holborn, to which the working drawings are attached. Wiebeking, a German engineer, has constructed some fine bridges of wood. One at Bamberg is 208 feet span.

A great change in modern bridge-building has been effected by the introduction of iron and the use of chain or suspension bridges. The principles of which, should be observed, were understood as early as 1615. See Scamozzi's Del Idea Archit. [CHAIN BRIDGE.] The most remarkable bridge of this kind is the Menai or Beaumaris bridge, near Connewton, which connects the island of Anglesea with the mainland opposite. A similar bridge has been constructed over the Thames at Hammersmith, near London. Very similar to this bridge is the Chinese chain-bridge on the high-way of Yunnan, in the province of Koubchow, the work of General Pan-ho. (Duhamel, vol. i. p. 60.) Suspension bridges have also been thrown over the Seine at Paris: the first that was erected there fell down almost immediately after its completion. Numerous bridges of this description have been made in Great Britain within the last 20 years, of which the late Mr. Telford constructed by far the larger part.

The merit of having first employed iron in bridge-building is attributed to the English, but it really belongs to the Chinese. (Duhamel, vol. i. p. 60.) The first iron bridge built in England was erected in 1779 at Coalbrook-dale over the Severn: it consists of one arch upwards of 100 ft. wide, composed of five ribs, each rib formed of three concentric areas, connected together by radiating pieces. The interior arc forms a complete semicircle, but the other areas extend only to the sides under the roadway. These areas pass through an upright frame of iron at each end, which serves as a guide, and the small space in the haunches, between the frame and the outer arc, is filled with a ring about 7 ft. in diameter. On the top of the ribs cast-iron plates are laid to sustain the roadway. The interior ring is cast in two pieces, each piece about 70 ft. long, and the total weight of metal used is 376½ tons. (Nicholson's Dict.) Since 1779 many iron bridges have been constructed in Great Britain, and some few on the continent. The largest iron bridge yet made is that of three arches, from the Southwalk side of the Thames to Queen-street in the city of London. Mr. Telford proposed to erect an iron bridge of one arch only over the Thames at this place.

Bishop Wearmouth bridge, which is also of iron, was erected between 1793 and 1796. It consists of a single arch 240 ft. span. The bridge over the Severn, at Bewdley, built by Mr. Telford, is a single arch 130 ft. span and 27 ft. in height from the springing to the intrados. Vauxhall bridge over the Thames at London, is one of the lightest constructions in iron with which we are acquainted. Smaller bridges of iron are now common enough over narrow streams, and over the entrances of docks: they are sometimes of one leaf or part, and sometimes consist of two leaves. Those made of one leaf turn on a centre, or a series of balls or
rollers: those which consist of two parts turn on a number of concentric rollers, which move between two circular cast-iron rings very nicely turned; each leaf or part has a flap, which lets down by a screw, and shuts upon the stone-work on either side, forming the whole bridge, when shut, into an arch capable of bearing any weight which can possibly pass over it. (Nicholson's Dict.) A bridge of this kind at the London Docks, which weighs 83 tons, is opened and shut again in three minutes. The most recent bridge, and the largest yet constructed of this kind, is the bridge at Lowestoft in Norfolk, over the new cut which connects Lake Lothing with the sea.

The following are the dimensions of several of the principal bridges of Europe as near as we can ascertain them.

**Length and number of arches of a few of the principal Bridges of Europe and America.**

Alberti is perhaps the earliest writer on bridges, and he has been followed in a great measure by Palladio, Serlio, and Vignola. The most correct and copious information on bridges the reader may consult Mr. Gautier's work, Belidor's Architecture Hydraulique, and Perronet; also Bosset and Rion on bridge-building. Mr. Telford's work on bridges, which it is understood will be shortly published, is expected to contain much valuable information, and Lord Brougham, Mr. Design, Asa, Semple, Emerson, and Dr. Hutton, have also written on bridges.

**BRIDGE HEAD, or Tête de Pont,** is a fortification covering that extremity of a bridge which is nearest to the position occupied by the enemy, in order, by securing the line of communication, to facilitate the advance of an army or protect its retreat.

When a bridge is built across a riv, which runs through or along one side of a fortified town, the ramparts of the town are taken as the foundation for the construction of any buildings beyond the riv, in the other, may be considered as constituting the bridge-head; and then the works enter into the class of permanent fortifications. In other circumstances their form depends upon the nature of the ground, and upon the importance of the pass to be protected. If a retreating army is likely to be exposed to a serious attack, when about to cross a riv, the works must be strong enough to keep the enemy in check, and sufficiently extensive to contain the whole army, till the passage can be effectually secured.

The simplest kind of bridge-head is one which has the form of a redan; that is, a breast-work, with two branches disposed on the plan like the sides of the letter A, and terminating on the bank of the riv. But when a more perfect defence is required, the bridge-head may have the figure of a horn-work, or of a fort with bastions; the area to be occupied by the defenders being inclosed, except at the gorge or riv, by the rampart or breast-work. When however the bridge-head is to be sufficiently capacious to serve as an intrenchment for the whole of an army, it may consist of a series of redoubts flanking each other reciprocally, and defended by lines of advanced works on the riv.; and whatever be the nature of the work, when its capacity is considerable, it is recommended to have a redan or small fort immediately covering the bridge, with its faces so disposed that the fire from thence may defend and dismount the assailants. This small fort will also serve as a retrenchment in which, after the main body of the army has passed over the riv., a small division may be stationed to protect the retreat of the troops employed in defending the principal works. The passages by which an army or detachment, in retreating, may escape the bridge-head consisting of a continuous parapet, should be situated in the re-entering angles of the work, if such there be, where they may be well flanked by crossing fires from the collateral faces: and they should be defended by a direct fire from traverses in the interior.

To prevent the enemy from advancing towards a bridge along the bank on which the works are situated, that bank both on the right and left of the bridge should be well defended by a fire of musketry or artillery; consequently the parapets adjacent to the riv. should be as nearly as possible perpendicular to its direction. And it is evident that the most favourable situation for a military bridge is at a bend of the riv., where the concavity is towards the enemy's position; for the fortifications will thus conceal the bridge from his view; and on either side of the work the batteries are placed to defend the adjoining banks, the fire from which, when attacked; a traverse also should be raised on the same side of the riv. perpendicularly to the length of the bridge, in order to enfilade the latter in the event of the enemy attempting to force a passage over it before it can be destroyed.

When there are islands in the river it is advisable to establish the bridges so that they may connect the islands with the opposite banks, for thus the bridges, being shorter than if they were to extend quite across the river, may be better and more cheaply defended. When numerous information on bridges the reader may consult Mr. Gautier's work, Belidor's Architecture Hydraulique, and Perronet; also Bosset and Rion on bridge-building. Mr. Telford's work on bridges, which it is understood will be shortly published, is expected to contain much valuable information, and Lord Brougham, Mr. Design, Asa, Semple, Emerson, and Dr. Hutton, have also written on bridges.

**BRIDGE, MILITARY.** [PonToon.]

BRIDGNORTH, a bor. and m. t. in the S.E. part of Shropshire, 19 m. N.N.E. from Shrewsbury, and 139 N.W. from London. The town lies on both sides of the Severn, which are connected by a bridge; but the larger portion is on the W. bank, built on a hill which rises 69 yards from the bed of the river. The bor. and town were co-equal, consisting of the parishes of Ludlow, Leon and St. Mary Magdalen, but certain liberties were also under the jurisdiction of the bor. magistrates. The parliamentary bor. was extended by the Reform Bill, and now includes the parishes of Quatford, Olney, Tasey, and Army-Abbey. In 1831 the return was 6171, that of the old bor. 5998. Bridgnorth, anciently Bruges, is stated to be of Saxon origin. The first known charter is one of the 16th John, confirmed by subsequent grants, by which special privileges are secured to the inhabitants. By the Municipal Reform Act the town council consists of 4 aldermen and 12 councilors, but the town is not divided into wards. The bor. returns two members. In the par. of St. Leonard there...
are four daily schools, one of which is an endowed grammar-school, and two boarding-schools; in St. Mary Magdalen's there are four daily schools and three Sunday schools; and there is a daily school in Quatford parish. The appointment of the two schools with the two boarding-schools will produce a source of profit to the inhabitants. The market day is Saturday. There are four annual fairs, on the Thursday before Shrove Tuesday, 20th June, August 2nd, October 29th (which latter lasts three days), for cattle, sheep, butter, cheese, bacon, etc.

The prosperity of Bridgnorth renders it airy and healthful. Charles I. is said to have considered it the most pleasant place in his dominions. The prospect from the top of the hill is delightful. There is a curious walk made from the high part of the town to the bridge, being bawn to the depth of 20 ft. through the rock; the descent is great, but it is made easy by steps and rails. Until 1797 the corporation maintained the bridge out of the proceeds of certain estates and tolls. In that year, the bridge having fallen into decay, an act was obtained by which commissioners were appointed who, with a jury, were to repair the bridge at the cost of the trust. A new groyl was built in 1833. In Leland's time, the castle, on the S. side of the town, was of considerable extent; but when Grose visited the place, there was nothing left but what seemed part of a tower, which by undoubted evidence is said to be the base of the perpendicular. It is uncertain when or by whom the castle was built.

In 1102 Robert or Roger de Belesme, Earl of Shrewsbury, strengthened Bridgnorth and defended it against Eustace, Earl of Boulogne; and in 1311, when his life is stated to have been saved by a knight, who stepped forward and received in his own person an arrow aimed at the king. The inholders sided with Charles I. during the civil war; and Bridgnorth endured a siege of nearly a month without being surrendered.

The inholders of Bridgnorth are very little connected with it. They are separated from the town by a tract of hilly and thinly-peopled country, and their chief market is Wolverhampton. (Beauties of England and Wales: Boundary Reports; Municipal Corporation Report; Education Returns.)

BRIDGTEOWN. [Barbodors.]

BRIDGWATER, a port, bor., and m. t., situate on the banks of the riv. Parret. Parret, in the bund of N. Petherton, and on the estuary of the Bridgewater at Bridgwater West Wells, and 125 W. by S. from London, and in 51° 7' N. lat. and 2° 59' W. long. The limits of the bor. are co-extensive with those of the par., the area of which is 3580 English statute acres.

Bridgwater, in ancient charters called Brugia, or Brugis. Bradg-Walter and Burgh-Walter, derives its name from Walscine or Walter de Douay, on whom it was conferred by William I. Prior to this it belonged to a Saxon Thane, named Merlesin, as appears from Domestacy Book, in which it is thus surveyed: 'Walscine holds Brugis, Merlesin in the time of King Edward, and gaded for five hides. The amble is ten carucates, in demesne are three carucates and five servants, thirteen villanage, nine bordars and five cottagers, with eight ploughs. There is a mill of 50 acres, and ten acres of meadow and 100 acres of pasture. When he held it, it was worth one hundred and seventy pounds.'

William de Briwere, to whom the manor had been granted by Henry II., built a castle at Bridgewater of considerable strength, and through his interest with King John obtained the town a market and a fair. This William de Briwere also founded the hospital of St. John, for the benefit of the souls of Kings Henry II., Richard I., and King John, consisting of a master, brethren, and thirteen poor persons of the orders of St. Augustine. This hospital house, which was confirmed by Bishop of Bath, in the year 1219. Leland, who visited it in 1538, describes it thus : 'In the Est part of the Town is only the House, late College of St. John, thing notable, and this house standeth partly without th'est gate. This college had prettes that had the apparel of secular priests, with a cross on their breste, and to this house adjoined an Hospices for poor folks.' It appears from the Harleian MSS. in the British Museum, that William Lord de la Zouch and Seymore, and Richard Duke of York and Earl of Ulster, and Lord of Wigmore and Clare, were patrons in 1457. Its revenues at the time of the dissolution of the monasteries amounted to 1201. 19s. 10d. In the W. part of the town there was a priory of Minorits or grey friars, dedicated to St. Francis, founded by a son of William de Briwere, the site of which was given to one Emmanuel Lukar by Henry VIII. The palace, which was a stately building, was at one time an hospital for lepers. The founder of St. John's hospital also commenced a stone bridge with three arches across the riv. Parret, but it was only completed in the reign of Edward I., by Sir Thomas Trivet, whose arms being a trivet, says William of Worcest. "were alluded to the coping of the structure."

Bridgwater is the birthplace of the earls of Bridgewater by the barons during their revolt against King Henry III. In the civil wars it stood out a long time for the king. The castle was strongly fortified, having forty large guns mounted on the walls, and a most of great depth and 30 ft. wide, which every tide filled with water. Colonel Wyndham, the governour, defended it a long time against the rebels; but at last, on the 22d of July, 1645, he was compelled to surrender. Upwards of 1000 prisoners, 44 barrels of powder, 1360 arms, 44 pieces of ordnance, and a great quantity of ammunition, was made in the castle. The powder was sent to the castle for safety (it having been declared impregnable), were taken by the besiegers, amongst whom the booty was divided. The castle was completely dismantled, and the only remains of it are the sally-port and some small detached buildings of the fortification.

The inhabitants of Bridgewater supported the claims to the throne of the Duke of Monmouth, a natural son of Charles II., and he was proclaimed king by the mayor and corporation.

The electoral franchise was conferred on Bridgewater by Edward I., in the 32nd year of his reign, since which time it has returned two members to parliament. Its first charter was granted by King John, on the 26th of June, 1200, and twelve other charters were granted to it between that time and 1853. The borough, from the first, has been in the county court of the hundred of Brook, in the jurisdiction of which extends to all personal actions and to any amount. The court sits from Monday to Monday; but as the expenses are very heavy, very little business is done. There are also petty sessions every Monday. The July county sessions are held here, and the summer assizes alternately with Wells.

The town is pleasantly situated, about 9 m. from the sea, in a level but well-wooded country; to the N.E. are the Polden and Mendip Hills, and on the W. the Quantock Hills. The town is situated on a large and deep estuary, and a stone bridge, divided the town into two parts. The W. part is the more recently inhabited; the streets are well lighted with gas and paved, and the houses are generally good; some are built of brick, and others of a good, durable stone; the most of the houses are found in the ruined part of the town, called Eastoverer, is little more than a suburb, and is meanly built. The town hall is a good building, and well adapted for business; over it is a cistern with an engine by which the inhabitants are supplied with water. The grammar-school is very convenient, and has separate divisions for the male and female prisoners.

The interior of the parish church dedicated to St. Mary is handsome, consisting of a nave, chancel, and two side aisles. The outward part of the structure is mean and ill-built; there is no tower, and the very plain receding interior is surmounted by an unproportioned spire. The altar-piece, which is much admired, was presented by the Honourable A. Poulett, many years member for the bor. It represents the descent from the cross, and was found on board a captured French privater. The painter of it is uncertain. The living is a vicarage, united with the rec. of Chilton Trinity, in the archdeaconry of Taunton and diocese of Bath and Wells.

The crown is the patron of the living, the net income of which is 342s. 2d.

The riv. Parret is navigable as far as Bridgewater for vessels of 200 tons; but it is subject, like some other rivs. in the Bristol channel, to a rise of nearly six fathoms at spring tides. The flow of the tide is preceded by a head water commonly termed the ' bore,' (Bore) which often produces much inconvenience to the shipping. The principal imports to Bridgewater are coal, lime, hemp, tallow, and timber. Coals are imported from Wales, and conveyed into the in-
terior of the country by means of the riv. Parret and a can. The former is navigable as far as Langport; the canal runs to Taunton, and thence to Devonshire. The foreign trade is principally with the U.S., Canada, Newfoundland, and the W. I. The number of vessels belonging to the port (as stated in the census of 1821) was 204, with a tonnage of 26,500 (an average burden of sixty tons). Many of the inb. are occupied in the fabrication of a peculiar sort of white brick, which is made of all sizes, and the common brown. The great market-day for provisions, and especially for cheeses, for which the neighbourhood is celebrated, is on Thursday. There are also smaller markets on Tuesday and Saturday. The market-house is a fine building, surmounted by a dome and a lantern. Fairs are held here on the first Monday in Lent, the 24th of July, the 2nd of October, and the 27th of December. The second of these, called the Fair of Matthew's Fair, was heretofore the mart of Somersetshire and the adjoining counties, and is still of considerable importance.

The pop. of Bridgewater in 1831 was 7807, of which 4124 were females.

There are places of worship for Baptists, Quakers, Independents, Wesleyan Methodists, and Unitarians. The free grammar-school was founded in 1561, and endowed by Queen Elizabeth with £6 13s. 4d. per annum, charged on the brickworks, to which £200 was afterwards added. It is under the control of the corporation, who appoint the master, and under the immediate inspection of the bishop of the diocese: four boys are taught gratis in the classics and four in English. In 1723 Mr. Joule re-built the old school house, and erected in its place a new school house (Booth's system), and endowed it with lands to a considerable amount. The management of the school is vested in the hands of trustees, amongst whom are the archdeacon of Taunton and the vicar of Bridgewater: in 1816 a spacious school house, and a house for the master were erected. The present number of scholars is about thirty, some of whom are clothed. A school was also founded by Mr. Edward Tackerell, and endowed by him with the dividends of 3000l. in the funds, and the rents of certain messuages, amounting to £102 5s. 6d. yearly, for the educating and apprenticing the children and grandchildren of certain of his relatives. The management of this school, which was the subject of a Chancery suit, is now in the hands of trustees, whose accounts are annually audited by a master in chancery. Several sums appear from the 'Reports on Charities' to have been left by will for the instruction of poor children: 52l. by Richard Holworthy; 41l. 10s. by Dorothy Holworthy; Richard Castleman left 2614l, and James Stafford 40l.,—all for the like purpose. Some almshouses in the town, inhabited by indigent persons, are now in the possession of the parish and the town which have been erected and endowed by persons of good will. The object of the parish is to provide some furniture and to maintain a master; the fund for the educational purposes is 100l.

Bridgewater was the birth-place of Admiral Blake, and he was educated at the free grammar-school there.

In the neighbourhood of Bridgewater is the Isle of Athelney. [ATHELNEY.]

8 'Reports on Charities: Correspondence from Bridgewater; Leland; Harl. MSS.; Corporation, Ecclesiastical, and Charity Reports, &c. &c.'

BRIDGEBRIDGE, FRANCIS EGERTON, DUKE OF, born in 1736, was the youngest son of Sercoop, fourth Earl and first Duke of Bridgewater, by Lady Rachel Rus- sel, daughter of Wriothesley, second Duke of Bedford. He succeeded his brother, the second duke, in 1748. He was the heir of the Lord Chancellor Ellesmere in the sixth degree of descent. In his youth he was extremely thin and delicate. He recovered from a predilection to pulmonary consumption; the doubts and anxieties which resulted from his education were early abandoned. He never got the better of this early tendency, which proved very fatal to his body, but became a very strong man and extremely corpulent. As his health took him entirely out of society, he contracted habits of extreme shyness, which made him avoid company, especially that of ladies. But though the defects of his early education and the singularity of his character were not unfrequently exhibited, his mind was naturally of a most powerful and determined character, bordering perhaps occasionally on obstinacy; indeed it was owing to this quality, and his extraordinary enterprise, sagacity, and pru- dence, that he laid the foundation of that situation in the world which he derived from the accident of birth. One of the estates which he inherited, situated at Worsley, near Manchester, contained a rich bed of coal, but it was comparatively of little value, in consequence of the heavy expense of land carriage and the inadequate means of communi- cation afforded by the Irwell, which, though rendered navigable, was a tedious and imperfect medium for carrying on an extensive traffic. In delivering on the best means of supplying Manchester with coal from his pits at Worsley, the Duke, in consultation with his attorney, called Sir Matthew's Fair, was heretofore the mart of Somersetshire and the adjoining counties, and is still of considerable importance.

The pop. of Bridgewater in 1831 was 7807, of which 4124 were females.

There are places of worship for Baptists, Quakers, Independents, Wesleyan Methodists, and Unitarians. The free grammar-school was founded in 1561, and endowed by Queen Elizabeth with £6 13s. 4d. per annum, charged on the brickworks, to which £200 was afterwards added. Some almshouses in the town, inhabited by indigent persons, are now in the possession of the parish and the town which have been erected and endowed by persons of good will. The object of the parish is to provide some furniture and to maintain a master; the fund for the educational purposes is 100l.

Bridgewater was the birth-place of Admiral Blake, and he was educated at the free grammar-school there.

In the neighbourhood of Bridgewater is the Isle of Athelney.
of the canal is at first N.W. and afterwards due W. until it enters the tideway of the Mersey at Runcorn by the bridge built in 1823-8 over the Trent and Mersey Canal. It crosses the River Runcorn at the lock at Newton-le-Willock, every part of the canal was executed, under the direction of Mr. Peacock, in about five years. The aqueduct at Barton was opened July 17th, 1761, and soon afterwards the whole line. It cannot be computed what the total expense incurred by the Duke of Bridgewater in completing this great undertaking amounted to. The duke's canal however has done as much to promote the public prosperity as to increase the wealth of the noble projector's heirs. Before its construction costs were returned to the poor at Manchester at 7d. per hundredweight and in the town of Manchester at 3d. per hundredweight. These duties were given to the estate. The carriage by water from Manchester to Liverpool was 12s. per ton; by land it was as high as 40s.; on the duke's canal the charge was 6s. per ton. The wealth which he was the means of creating was thus diffused among every class of his countrymen. When the line of his canal had been tripled in length, the duke never demanded larger tolls, but contented himself with the profits which the increase of traffic fairly brought him. The Duke was also one of the most zealous promoters of the Great Western Railway, and had the Marquis of Stafford, being at his head, they mutually aided each other. In the construction of his great work he had exhausted his credit to the utmost; he could not raise 5000l. on his bill in the city of London, and his agent, Mr. Gilbert, had recourse to the sale of the estates of the Marquis of Stafford, Lancashire, from door to door, to raise sums, from 10l. and upwards, to enable him to pay the Saturday night's demand. At the same time the Duke restricted himself to the simplest fare, and lived with scarcely a servant to attend upon him. But the great achievements of railway in one, with the increase, was then unencumbered, but no persuasion would induce him to resort to the easy method of relieving himself from difficulties by borrowing money upon them. When in London he would not undertake the trouble of going into society; he made an allowance of 2000l. to a friend of his, (Mr. Carvill,) whom he dined, when not otherwise engaged, and to whose table he had the privilege of inviting his intimate friends.

The Duke of Bridgewater never took an active part in politics; but he was a decided friend to the Pitt Administ- ration, and a strong supporter of the Loyalty Act. He died March 8th, 1803, and never having been married, his great wealth was distributed among the collateral branches of his family. The canal property, with the Lan-cashire, Cheshire, Yorks., and Derbyshire estates, he left to his nephew, the late Duke of Sutherland. The large sum of 10,000l. a year to the son of Lord Francis Egerton, who had just (Feb. 1836) intimated to the authorities of Manchester his desire to erect a public monument in that town to the memory of the Duke of Bridgewater.

(Phillips’s History of Inland Navigation; Priestley’s Historical Account of the Navigable Rivers and Canals, &c. of Great Britain.)

BRIDGLINGTON, formerly written B RELington, but now commonly pronounced Burlington, is a port and market town, the county town of the large and ancient city of York, noted for the discovery of the source of the River Ouse, and for the many ancient buildings which are still extant. The town is situated on the west bank of the Ouse, near the confluence of that river with the Wharfe, and is about 24 miles N.E. from York, and 26 miles N. from Hull. The county town of the ancient and extensive county of York, is a city of considerable importance, and is the chief market town of the eastern part of the county. The town issituated on the west bank of the Ouse, near the confluence of that river with the Wharfe, and is about 24 miles N.E. from York, and 26 miles N. from Hull. The county town of the ancient and extensive county of York, is a city of considerable importance, and is the chief market town of the eastern part of the county.

No. 324. THE PENNY CYCLOPEDIA.]
monks of Bridlington are often mentioned in early histories; and several of them were eminent for piety and learning. Mr. Whitaker, the historian of Craven, speaks of 'the religious' as attendants at the great annual fairs held in different parts of the country. He says, 'the canons of Bridlington repose in the church at Botany, and in their burials at 1290 and 1325. In the computus of the priory at Bridlington, a yearly account of wine, cloth, grocers, &c., bought a spud sanctum Botolphum. The last prior, William de Wode, was installed in 1351; having taken an active part in the dissensions between the Barons and the King, he was attainted of high treason and executed at Tyburn, A.D. 1357. William de Newburgh was a native of Bridlington, though a canon of Newburgh. His Historical Chronicle commences with the Norman conquest, and is now a perpetual calendar of 1454. per annum.

The monastery existed for centuries; when it was dissolved its revenues amounted to 500l. per annum, an immense income at that day. In 1539 it was demolished, and the manor and rectory became the property of the king, by whom they were granted on lease to various individuals, eight pounds a year being assigned to be paid by the lesse for the maintenance of a parish priest. In the time of Charles I. the manor and rectory were separated and sold to different persons; the latter passed through several hands, and is now a perpetual calendar of 1454. per annum.

History.—In 1643, during the differences between Charles and his parliament, Bridlington became the scene of temporary hostilities. The queen, who was bringing a supply of arms and ammunition from Hellevoetsluis, under the command of Admiral Batten, was narrowly escaped the squadron under the command of Admiral Batten, who had been stationed to intercept her. After her landing, Batten entered the bay with two of his ships, and for some hours the town was subjected to his cannonade. This foundation was saved for the tide would have left him in shoal water. A lively sketch of this transaction, from the pen of the queen, is given in Thompson's Historical Sketches of Bridlington, which is taken from the Gentleman's Magazine for August, 1744. A committee visited the town in celebration of this event. Bridlington on the 20th September, 1779, soon after his descent upon Whitehaven. On the following night by moonlight an action commenced, so near to Flamborough Head, which was crowded with spectators, that some of the balls grazed the cliffs. The conflict was between the four ships of Jones and the convoy of the Baltic fleet, the Serapis and the Countess of Scarburgh. The action, which was very sanguinary, lasted several hours, when the two convoy vessels struck. Jones reached the Texel safely before night.

The Priory Church.—This venerable and splendid specimen of ecclesiastical architecture has been well judged worthy of a description and illustrations. A few general observations and extracts from Mr. Pickett's work may be necessary. This church was built of stone on a solid foundation of granite; the materials of the ancient part remain or of their former beauty. The nave and an arched gateway leading to it are the only parts now left of the once spacious monastery. The W. front has had two towers, of which the lower stories only remain. This front still retains a great degree of architectural magnificence, and is in the style of the beautiful collegiate church of Beverley. 'The date, 1106, preserved on a stone placed very conspicuously over the entrance, is supposed to mark the year of its foundation.' (Bigland's Yorkshire.) 'The grand western entrance is a splendid specimen of the archetypal spirit of Henry VII.'s time; excepting however the northern-western tower, which belongs to a much earlier period.' 'The style of the northern-western tower is early English, as is also the whole of the northern side of the church. 'The west window is 65 ft. in height from its base to the crown of the arch, and 27 ft. in breadth. The head is filled with good pen-and-pencular tracery; the lower compartment below the transom is the only portion at present glazed, and is 15 ft. high. Along this there is a gallery connecting the two western towers. The fine arch which supports the arcades is 3 ft. 4 in. high. 'The window is 2 ft. wider than the part below the transom. 'The north porch is a truly splendid specimen of architecture, and perhaps better worth preservation than any other part of the fabric; but it has been sadly neglected, as the entrance is seldom used, and it has been supposed that the stone accumulates so much against the whole of the north side of the church that there is now a descent of several steps into the porch. 'The length of the present church is 185 ft., and the distance of the farthest pillar from the east wall of the church, whose foundation has been taken up, 152 ft.; so that the ancient church seems to have been nearly of the same length as Beverley minster, about 333 ft. 'The height of the distant tower with its leaden cupola, which was erected (for the reception of the bells) on the top of the basement of the south-west tower is as anomalous and disfiguring as can well be conceived.' About one-third of this church is fitted up for public worship, and will contain most of the inhabitants. (An Historical and Architectural Description of the Priory Church of Bridlington. By the Rev. Marry-Muir Pickett.)

The dissenting congregation in Bridlington are two of Wesleyan, one of Baptist, one of Independent, one of Quakers, and two of Primitive Methodists. A chapel called 'the Union' is used by persons of different denominations. The Wesleyan Methodists have two Sunday schools which contain 300 children; the Independents' Sunday school contains 80 children; and there are other Sunday schools of minor importance.

Education, Charities, Commerce, &c.—In the year 1636 William Hustler, an inhabitant of Bridlington, left a sum of 40l. to be paid annually out of his estates for the maintenance of a schoolmaster and usher. The children of the par., were to be taught grammar and other useful kinds of learning. For some time the office of schoolmaster was held by the minister or curate of the par., and that of usher by the parish-clerk. By a decree in chancery in 1819 the present plan was established. The present master is the office of master had become a sinecure in consequence of the non-residence of the minister. The present master is also the parish-clerk: he instructs 20 boys, children of poor parishioners, in grammar, reading, writing, and arithmetic, and the girl of the parish 8 others, who takes paying pupils. Another school was founded by William Bower in 1781, with 20l. per annum for ever for maintaining and educating the poor children of Bridlington and Key in the art of carding, knitting, and spinning of wool. Twelve children of poor parents receive education in this school. By will dated April, 1696, left the rent of certain lands for charitable purposes: these lands at present let for 170l. per annum. (Thompson's Historical Sketches.) In 1734 Timothy Wolfe bequeathed by will the sum of 500l. to purchase land, the rent of which is to be distributed among the poor for ever; and in 1795 Isaac Wall bequeathed the interest of 1000l. 3 per cent. consols to be distributed amongst the poor for ever. (Pickett's Description, Appendix.) The national school was commenced in 1818. In the year 1822 the sum of 2l. 12s. 6d. had been raised by voluntary contributions in the inl. raised a sufficient sum for the erection of two school-rooms, one for boys and one for girls, each capable of containing 200 children. The schools were opened in 1826, and nearly 300 children are educated in them. An infants' school had been opened in 1829. The object of the establishment is the advancement of education in the village of an occasional resident, which is well managed and contains 100 young children. In addition to these schools there are about 20 others, including day and boarding schools. There are two public subscription libraries and a small museum. The market extends across the priory gateway; the lower rooms of the gateway are used as a prison; the corn-exchange is in the market-place. The town was first lighted with gas in the year 1833.

The streets are narrow and irregularly built, and the windows are supported on pillars and columns, with a considerable variety of style. The streets are generally built chiefly in corn, and was formerly very extensive: large quantities were brought hither from the great agricultural tract bordering the Wolds and from Holderness, and it was conveyed from this port coastways to London. The opening of the navigable can. from Driffield, has considerably increased the corn-trade of Bridlington to decline. It is one of the places which has an inspector of corn-returns, and weekly accounts of the quantity and price of grain sold are transmitted to the general inspector in London. Malt and ale were formerly the staple trade; in 1706 there were 60 malt-kilns in constant use: this trade has very greatly declined. Soap-boiling and bone-grinding for the purpose of manure [Boxs] are now carried on, and the manufacture of hats employs a few persons. These occupations, in the retail business of the town, are confined to the agricultural district, and the influx of summer visitors, are the chief means which contribute to the support of the inl.
The import is chiefly coals from Sunderland and Newcastle, timber from America and the Baltic, and general merchandise from London and Hull: the port is a member of the port of Hull. Two fairs are held annually in a large open area between the priory gate, called also the Baye Gate, and the tide walls, called the ancient market-place. On the S. verge stands the par. poor-house, a large old building, said to be 'unhappily crowded with inmates.' At a short distance are two circular mounds of earth 184 yards across, called 'the old hearths,' where the practice of archery before the introduction of fire-arms. (Historical Sketches.)

Bridlington Quay is a small modern town in the recesses of the bay on the sea-coast, the principal street of which runs directly to the har. and is very wide. The N. pier and breakwaters were commenced at 26th Aug., 1811, in the absence of the Earl of Scarbrough, afterwards chancellor of the exchequer, the Earl of St. Andrews, Sir John Newenham, and the Secretary of State for War. (ibid.)

Bridlington has a good anchorage in this bay, particularly when the wind is unfavourable for coasting-vessels proceeding round Flamborough Head N. The amusements of Quay during the bathing season are chiefly those of riding and sailing. The beach has a fine hard sand, which affords a good walk at low water. There are warm and cold seawater baths for invalids and rooms which possess all the requisite accommodations. At a short distance there is a chalybeate spring of reputed efficacy, resembling the waters of Flaxfield in Surrey. The town is supplied with fresh water by a dyke from the fresh-water bayed back, and at the ebb of the tide discharged with rapidity, in order to scour the sand. Until 1822, the corporation were the exclusive trustees of the harbour; but in that year a new act was obtained for its improvement, by which, besides the buildings and barges, many individuals were made commissioners for the execution of the act. This act fixed a maximum of tonnage dues on vessels, and of dues to be received on exports and imports. A sum of 17,800l. was borrowed, and together with a sum of 1000l. paid in 1817, it has been applied to the expenses of the dock, which has thereby been rendered safe and commodious for shipping not exceeding 250 tons burthen. The trade of the port is rapidly increasing. In 1844, the number of vessels which entered was 128, their tonnage 9926, the harbour dues 496l. In 1853, the number of vessels was 143.

Inwards. Outwards.

Foreign trading vessels. 27 2,404 | 15 422
Coasting trading vessels. 233 21,042 | 117 11,524

Bridport was made a bonding port in 1832. The total amount of harbour duties in 1833 was 5224l.

The staple productions of the town are twine, lines, and fishing-nets. Of late years the manufacture of sail-canvas and shoe-thread has become extensive. The exports consist mainly of woollen goods, which are carried to various parts, of which the county of Dorset is celebrated; and the imports of hemp, flax, deals from the Baltic, wines, spirits, skins, coals, culm, and slates. The town is also celebrated for the skill of its ship-builders.

The pop. of the bor. and par. of Bridport, which were formerly co-extensive, has considerably increased since the beginning of the present century. The pop. of the new bor. created by the Reform Bill, which is more extended than the old one, cannot be ascertained with certainty, but is probably about 7900. The borough returns two members to Parliament.

The old mail road from London to Exeter passes through Bridport, and forms the main street. The principal streets are spacious, and tolerably wide. The church of St. Mary's, near the lower end of South-street, is a neat square building, in the form of a cross. There are four dissenting chapels. There were several religious foundations and chantries, few relics of which now appear. In the bor. and par. there are sixteen daily schs., one of which contains eighty-two children, and is supported by an endowment. There are four Sunday schools, all supported by voluntary contribution. Within the last two years a mechanics' institute has been established, and handsome and commodious rooms erected for its uses. (Hutchins's Dorset, corrected by Gough and Nichols; Boundary Reports; Municipal Corporations Report; Education Returns.)

Brie, a district in France, comprehended partly in Champagny and partly in the île de France, is bounded from the banks of the Seine toward the N.; its dimensions were, greatest length N.E. and S.W. nearly 70 m.; greatest breadth measured nearly at right angles to the length about 65 m. (Atlas to Encyclop. Method.) It was divided on the N. by the île de France (proper), Valois, and Soissonois, on the E. and part of the S. by G. and Brie, proper, on the remainder of the S. by Senone, and on the W. by Harpoix; from which it was divided by the Seine. The chief towns within its limits (with their pop. in 1832) were as follows:—
very early periods of the history of the church, were given as creditable to mendicant friars, who collected money from country to country, and from town to town, for the building of churches of advowson. Such pious uses of the pope's example, and as soon as the authority of the pope ceased in England, these briefs began to be issued in the king's name. They appear to have been always subject to great abuse; and the statutes of Anne, c. 14, after reciting that 'many inconveniences arose and frauds were committed,' enacted the following: 'any person collecting charity money upon briefs, enacted a variety of provisions for their future regulation, and, among others, prohibited, by heavy penalties, the practice, which had previously prevailed, of farming briefs, or selling, upon a kind of speculation, the amount of charity money to be collected. Still these provisions were evaded, and heavy abuses arose; and the collection by briefs in modern times was found to be most inconvenient and expensive mode of raising money for charitable purposes. According to the opinion given in 'Brock's Ecclesiastical Law,' tit. Brief, the charges of collecting 614. 12s. 3d., for repairing a church in Westminster, amounted to 330l. 16s. 6d., leaving therefore only a clear collection of 283l. 16s. 3d. This expensive and objectionable machinery (in the exercise of which the interests of the charity are promoted) were almost overwhelmed in the payment of fees to patent officers, undertakers of briefs and clerks of the briefs, charges of the king's printers, and other contingent expenses) was abolished by the stat. 9 Geo. IV. c. 4. This is, indeed, in many ways to the advantage of the church, building, rebuilding, or repairing, of churches and chapels in England and Wales, all contributions so collected shall be paid over to the treasurer of the Incorporated Society for promoting the enlargement, building, and repairing of churches and chapels, and shall be available for the purchase or building of churches and chapels, and for the aid of the society in executing its objects, to the nature of the case in which the briefs were granted, and the signs of the society to effect.' This statute does not interfere with the authority of the crown as to granting briefs; its only effect is to abolish the machinery introduced by the statute of Anne. Under the provisions of the 'Briefs of Erection,' 3 Will. IV. c. 22, a brief was granted and collected, in the year 1834, in aid of the funds of the church building society: and, under the common law authority of the crown, a brief was issued, in 1835, to increase the funds of the 'Society for the propagation of the Gospel in foreign parts, with a view to the conversion of pagan races and the emancipation of Negroes in the West Indies. The brief in the latter case recites that similar letters had been at various times granted, in aid of the Society's funds, by previous kings.

BRIEF, commonly called CHURCH BRIEF or KIRKBRIEF. The instrument consisted of a kind of open letter in the king's name, and sealed with the privy seal, directed to the archbishops, bishops, clergymen, magistrates, churchwardens, and overseers of the poor throughout England. It recited that the crown thereby licensed the petitioners for the brief to collect money for the charitable purpose therein specified, and required the several persons to whom it was directed to assist in such collection. The origin of this custom is not altogether free from doubt; but as such documents appear to have been issued by the crown, previous to the Reformation, they may possibly be derived from the papal briefs, which, from
A storm crosses the Oder at this place. Briel is about 465 ft. above the level of the sea, and about 26 m. S.E. of Breslau.

BRIEL, or BRIELLE; sometimes also called the Brill; a sea-port town on the N. side of the isl. of Voorn in the province of Zeeland; is situated near the mouth of the Maas in 51° 54' N. lat. and 3° 22' E. long.

The confederates, having been driven from the Netherlands by the duke of Alba, equipped a fleet in England and entered the harbour of Briel, which surrendered to them, and thus became the eastern seat of the independence of the Dutch republic. Thus the independence of the Dutch republic was in 1585 this town was given up to Elizabeth, queen of England, as security for advances made by her to the States of Holland, and it continued garrisoned by English soldiers until 1616, when it was restored to the Dutch.

The town is well built and strongly fortified. The bar is commodious, and capable of containing 300 vessels. The inh. consisted, in Jan., 1630, of 2000 males and 2195 females; the men are principally occupied as fishermen and pilots.

Briel was the birth-place of the Admirals van Tilloop and De Witt. The town is 6 m. N. of Helvoetsluys, 12 m. W. of Rotterdam, and 24 m. W.N.W. from Dordrecht.

BRIENNE. [Bonaparte and Aube.]

BRIENNE, JOHN OF, third son of Erard II, Count of Brienne sur Aulnois, a small town in Champagne near Troyes, and of Agnes of Montbeliard, was married by the recommendation of Philippe Auguste, to Mary, daughter of Isabel, wife of Conrad, marquis of Montferrier. Isabel was youngest daughter of Amaury king of Jerusalem, an emigrant from France, who had spent a great part of his life in his Scottish inheritance. The early life of John of Brienne nothing is known, but he was named by the king of France as the most worthy champion whom he could offer for the defence of the Holy Land, "as good in arms, faithful in war, and prudent in counsel." On the 14th Feb. 1196, he was confirmed in all his privileges; it was raised to the rank of a royal free town in 1655. There are 18 adjacent villas. within its jurisdiction, which, with the t., contain about 820 houses and 6300 inhab., of whom Briess itself contains about 3500. There are extensive pastures in the vicinity. and the breeding of sheep and sale of wool are carried on to a great extent. This is also the case with the articles of honey and wax, the produce of which is occasionally much diminished by the havoc which the bears from the adjoining woods contributed to its destruction. The best honey is made from sheep's milk. In the neighbourhood are several iron-works and quarries; precious stones, particularly rubies, are found in the beds of the mountain-streams, as well as in the rivulets in the Vale of Michalof. The t. has a Catholic cathedral, founded in 1206, and a public school for elementary instruction, and two churches. 49° 49' N. lat. 10° 40' E. long.

BRIEUC (SAINT), or BRIEUX (SAINT), a city in France, capital of the dept. of Côtes-du-Nord. It is situated very near the coast of the Manche or Channel on the small bay of St. Brieu, and on the high road from Paris by Rennes to Brest; 278 m. W. from Paris; 48° 30' or 32° 54' N. lat., and 5° 45' W. long.

This city owes its origin to a monastery built in the fifth or sixth century by Irish monks, and raised in the ninth century to the rank of a bishopric. It is near the little river Gouet, over which is a handsome granite bridge, and in a bottom surrounded by hills sufficiently high to intercept the view of the sea, although so near. It is one of the oldest, and one of the most celebrated cities of Legueu-Saint-Briex, which forms the port of the town. Saint Briex is a neat town, tolerably well laid out and built, with streets sufficiently wide, and well-looking places or squares. It has a cathedral, a Gothic building of the thirteenth century, and before it was celebrated there for a collegiate church of St. Guillaume and several parish churches; two monasteries (Cordeliers and Capuchins) and several nunneries. The garden of the Cordeliers is now a public promenade. Of the present commerce of the town we have little worthy information. Among its manufactures may be enumerated linens, serges and other similar woollen stuffs, unbleached thread or yarn, leather, paper, earthenware, and beer. It is engaged also by means of the port of Legueu the French colonial trade, and in the Newfoundland cod fishery. The pop. in 1832 amounted to 10,420. The town does not appear to have been walled. St. Briex is remarkable for its literary establishments. Its public library contains 24,000 volumes, which has a collection of books for marine phrenology, and an agricultural society. A theatre and a fine hospital are among its establishments; and there are horse-races at the beginning of July every year. —(Malte Brun; Balti; Dictionnaire de Bretagne, by Ogé.)

Briex is the bishopric seat; it includes the dept. of the Côtes du Nord, which has a pop. of 598,872. The bishop is a suffragan of the archbishop of Tours.

The arrond. of St. Briec is the most populous in the dept. It had, in 1832, 171,730 inhabitants.
BRIG, BRIGANTINE. [Shrt.]

BRIGADE. This term is generally applied, in military affairs, to the union of two or more battalions or regiments in one corps; but sometimes to the union of a certain number of men or guns in one subdivision. Thus from two to six battalions of infantry constitute a brigade, and one of cavalry may consist of two or three regiments. The British rifle brigade is composed of two battalions. A brigade of Sappers consists of 8 men, and is divided into two demi-brigades of 4 men each, one demi-brigade only being employed in the execution of a trench by single spar. Six pieces of ordnance form a brigade of artillery; and the horse artillery consists of 12 troops, to each of which one such brigade of guns is attached. According to Pére Daniel, command- ers and subordinate officers of several regiments, and the title of brigadiers, were instituted, in France, by Louis XIV. In the British service the commander of each brigade is entitled brigadier-general: his rank is immediately above that of colonel; and, to assist him in the performance of his duties, there is a brigadier-major, with his own staff, or a subaltern, he holds in the brigade the rank of junior captain. An effective field-officer of a regiment is not eligible to this post.

To a heavy brigade of artillery there are attached about 140 men, and as many horses, and to a light brigade, 100 men and 90 horses. Six-pounder and nine-pounder guns are employed in the field, but the latter kind seems now to be preferred.

During peace the British army is dispersed over the country, and brigades occupying each district. The commanders of regiments make their reports to the brigadier-general; the latter transmits them to the general of the district, and through him they are communicated to the adjutant-general or to the commander-in-chief. The number of battalions which are united to form a brigade, but also the number of brigades which constitute a division, is various; both brigade and division depending upon the strength of the several regiments and upon the nature of the service. If many sufficient troops, the battle of Corunna, where the British army consisted of about 25,000 men under arms, the first line was formed of three divisions, the division constituting each wing consisted of three brigades, and the centre division of two; some were composed of one, and one of them of three. The infantry in the second line was, in like manner, unevenly divided; the centre consisted of two brigades of cavalry, one of three regiments, and the other of two; and there were eleven brigades of horse and eighteen of foot.

As the separation of an army into two or more principal divisions permits the greater changes of disposition in the line to be effected with a unity of design which is essential to their utility, so the secondary evolutions are accomplished with less confusion, and the division in battle is so much greater in the battalions. The head of the army, having communicated the general plan of the action to the officers who are immediately under him, reposes on them with confidence for the diligent execution of the orders he may transmit, and is thus relieved from the necessity of following with his own eyes the movements of each particular battalion; while those officers, having the power of distinguishing themselves, either by a faithful adherence to the orders they may receive, or by the exercise of their judgment in modifying such orders, or in varying circumstances, are thereby prompted to display all their energies in making the necessary dispositions, and subsequently in animating the troops who are to execute them.

BRIGANTES, a tribe of ancient Britons who occupied that part of England which includes the counties of York, Lancaster, Cumberland, Westmoreland, and Durham, with the exception of the S.E. corner of Yorkshire between the Humber and the sea as far as Flamborough Head, which was inhabited by the Parisii (Camden's Britannia). The Britons of this tribe distinguished themselves during the reign of Claudius, when, having partially risen against the Romans during the war between the latter and the Iceni, they were defeated by the Praetor M. Ostorius, when some of their leaders were killed and the rest submitted and obtained peace. (B.J. II. 32.)

BRIGANTIS, the Roman province in Britain, which the Britons revolted against their Queen Cartimandua, who was an ally of the Romans, and who had forsaken her husband Venutius for a lover. Cartimandua escaped with great difficulty and by the assistance of some Roman cohorts, and Venutius remained master of the country of the Brigantes, and at war with Rome (Tacit. Hist. iii. 45). Under Vespasian the Brigantes were totally defeated by the Praetor Petius on the banks of the river Ribble, near a place named in the Roman records, Ribchester (Pausan. viii. 43.), which was subject to the Romans, for which they were attacked and defeated by Lollius Urbicus, and part of their territory was taken from them. In the division of Britain made by Severus, the Brigantes were in the prov. civ. 1. (A.D. 197). The prov. of Cartimandua (York) was the capital, and afterwards in the new division under Constantine they were in the prov. called Maxima Cæsarissia.

We find in Tolemy a tribe of Brigantes in Southern Hibernia between the rivers Brigus (Barrow) and Daborus (Nore) and according to the speckled map of the modern counties of Waterford and Tipperary. They are supposed by some to have emigrated from Britain.

The Brigantes must not be confounded with the Brigantii, a tribe in Vindelicia near the borders of the lake of Constance, who, according to Pausanias, were a terrible robbers, whose name was the dread of the neighbouring countries, and who in their incursions into Italy used to commit the greatest cruelties, killing all the men and male children and even the pregnant women. Whether it is from a common tradition of the ancient Britons of Britain, or that the word itself meant in its original language marauders, or free hands, as some have interpreted it, the name appears to have been held ever after in disrepute, and we find it in the French middle ages using the word Brigants savages, and in modern times it has become synonymous with the English also used to say of a bold lawless fellow, he plays the Brigants. (Carmen.) In the wars of the French revolution and of Napoleon the appellation Brigands became common in the French, being applied to signify all those who resisted them without being regular soldiers, whom accordingly they did not consider as entitled to any of the courtesies of modern warfare.

BRIGGS (HENRY). Most of the accounts of him are taken from his own letters and an account of 'the Grasmother' he published, where we shall also follow as to dates and personal facts. Mr. Ward cites Dr. Smith, Vita Henrici Brigeti, and Wood's Athenae Oxonienses. Briggs was born at Wareleywood, near Halifax, probably about 1556. He was sent to St. John's College, Cambridge, in 1574 or 1575, where he graduated B.A. in 1575, B.A. in 1591. M.A. in 1585, fellow in 1588, and reader in natural philosophy, on Dr. Linacre's foundation, in 1592. In 1596, on the establishment of Gresham House, London, (not then called College,) he was chosen the first reader (not professor) in the French letter, and afterwards the first reader in the science of geometry at Oxford, Sir Henry Savile himself having preceded him in the delivery of thirteen lectures. Briggs began where Savile left off, namely at the ninth proposition of the first book of Euclid. He entered himself of Morton college, but continued to hold the Gresham readership till 1620, when he resigned it, and continued to hold the Savilian professorship till his death, which took place January 26, 1630. He was buried in the chapel of Morton college. It is customary to record of him that he once called astro- nomers 'a crew of nimble-bebis,' which is the only saying of his we can find preserved.

The history of Briggs is that of his connexion with the improvement and construction of logarithms. When Napier, in 1614, first published his invention of natural or hyperbolic logarithms, Briggs was so struck with the invention, that he resolved to pay the author a visit in Scotland. He writes in a letter to Archbishop Usher, dated March 10, 1615, 'Naper, Lord of Markinth, hath set his head and hands a work with his new and admirable logarithms. I hope to see him this summer, for he is a good man and a good book which pleased me better, and made me more wonder. He went into Scotland accordingly, both in 1616 and 1617, and stayed some time with Napier. It must be observed that the first logarithms of Napier are a table of the values of e to every value of 0 for all the civil units of the quadrant, in the equation (as it would now be expressed)
How this apparently complicated system is more natural than any other is explained in Logarithmica. In 1615, Briggs, in his lectures at Gresham college, publicly explained the superior convenience of calculating the following table, on which he wrote to Napier, before his first journey to Scotland:—

\[
10^x = \sin \theta \quad \text{or} \quad x = \sin^{-1} \theta
\]

These are both on the supposition that the whole sine, as it was then called, or the sine of a right angle, is 1. Both Briggs and Napier made it such a power of 10 as left no decimals in the table, and therefore of course depending on the number of places in the logarithms contemplated. But Napier himself (according to his own writings) had been struck with the convenience of adopting a decimal system, and (according to Briggs's account) mentioned to him that he (Napier) had long thought that the system should be amended by what we should now call the tabulation of \( x \) from the equation

\[
10^x = \sin \theta \quad \text{or} \quad x = \sin^{-1} \theta
\]

if the whole sine be unity. The difference between the two last systems has nothing to do with the principle of the improvement in question. In the first two systems the logarithms of increasing sines diminish; in the third, the logarithms of increasing sines increase. Briggs, as he informs us, immediately admitted the merit of Napier's improvement, but was all the difficulty in laying in making the calculations: probably both Briggs and Napier thought little of the step as an advance in the theory, compared with the merit of actually carrying it into effect.

This latter part was done by Briggs (Napier died in 1616, while writing the first six pages of his log), who in 1618, (having printed them the year before,) his Chilias Prima Logarithorum, containing the first thousand numbers, with logarithms to nine places: and in 1624, his Arithmetica Logarithmica, which contains the logarithms of numbers (not of sines) from 1 to 20,000 and from 90,000,000 to 100,000,000, in places written with so much accuracy that he gives logarithms of integers and fractions.

It was fully done by Visard, who, in an edition of the work just cited, Gouda, 1628, gave (to eleven places) the logarithms of all numbers from 1 to 100,000, together with a corresponding table of sines, cosines, &c., for every minute of the quadrant. During this time Briggs was labouring at a logarithmic table of sines, &c., of which he did not live to complete the preceding explanations, but which was completed and published by his friend, Henry Gelibrand, whom he had associated with himself in the task some years before his death. This was published in Gouda, 1633. It is of fifteen pages of figures, and to every hundredth of a degree. Gelibrand states, in the preface, that, as about 30 years before his death, Briggs had calculated a canon of sines (natural sines of course) by algebraic calculation, and that the Logarithmorum is fully treated of in Dr. Hutton's preface to his Logarithmica, we shall content ourselves here with citing the passages which constitute the evidence:—

1. Napier, Rabdologia, 1616, published after Briggs left him, and in which he explained und Mr. Gooden estrud the exposition to Briggs as follows: 'Logarithmorum speciem alicum multo praestantiorum nunc etiam invenisse, et creandi methodum una cum eorum usum, si Deus longiorem vitam et vacuolitiam usum concesserit, evulgare statusum. Ipsa autem novi Canom supputationem ob informam corporis nostri valutudinem viris in hoc studi genere versatius relinquens; imprimis vero D. Henrici Briggs, Londini, publico geometrii professori, et amico mili longe charissimo.'

2. Briggs, in the preface of "Chilias Prima," &c., written 1618, after Napier's death, shows that the table of Napier (then announced by his son), justice should be done him, as follows: 'Quod autem hi logarithimi diversi sint ab ipsis, quos clarissimus inventor, memor me sor semper colendae, in suo edidit Canone mirifico, sperandum ejus librum posthumum abunde nobis proprie satisfacturum.'

3. Briggs, finding the above hint not attended to, makes the following statement in the preface of the "Arithmetica Logarithmica," 1624: 'Quod logarithimi isti diversi sunt ab ipsis, quos eloq. vir, baro Mercistonii, in suo edidit Cano mirifico, non est quod mereri. Ego enim, cum meus audiri videro by Anal. Londin. Lincolni, &c., non dubito, quod in nostris operibus nostris, et nostrorum autem, et quam primum per annos temporum, et vacationem a publico docendi munere licuit, profectus sum Erilburgum, ubi humanissime ab eo acceptus haei per integram sentem. Cum autem inter nos de haurimatione sermo serius et littere, ille ex idee dudum sensisse et nunprouo dubitavisse, verutamento istos, quos jam paraverant, edendos curasse, donee alios, si per negotio et valetudinem liceret, magis commodos perfecter. Itam autem mutationem ita facienda censebat, ut esse logarithmus unitatis, et ita 100,000,000,000, sine qui, quod ingerendos commodiorum esse, non potui non agnosce.'

The algebra of Vieta does not appear in the writings of Briggs, not even in the preface to the 'Trig. Brit.,' which must have been written many years after Vieta's death. For his first view of the coefficients of the Binomial Theorem, see that article. Briggs made considerable use of interpolation by differences, but his symbols and methods in general are like those of Stevinus. It must, however, be observed that the history of the introduction of Vieta's symbols into England is very scanty, and that there is of it so confusion that it would be quite impossible to make any comparison of Briggs's methods with his means. It is evident from the first page of the first book of the 'Trig. Brit.,' that Briggs was acquainted with one of Vieta's writings (the 'Rel. Ver. Cal. Gregori'), and from the rest that he had some of his methods; but it seems to us that there is throughout the whole a general suppression of his notation, and even of his name; particularly in the following sentence, which will surprise those who know what Vieta did: 'cudos inniendi subessas ab antiquis usitatus traditur a Procopiano, Copernico, et a reliquis, qui sunt et ante hos ab Hipparcho et Menelaou; sed ista alium modum invenit magis copiosius, et non minus certum.' While speaking of the introduction of the specious algebra, we should like to draw attention to the following question—What is the book described in the 'Cat. Briggii. Reg. Nespaliani Musaei' as 'Vietae Fr. Opera Math. Londini, 1592'? (See Hutton's Preface, above cited; Masae's Script. Log., vol. vi., Montaquila, &c."

BRIGHTON HOUSE, commonly written and pronounced BRIGHTON, a parliamentary bor., m. t., sea-port, and fashionable watering-place in the hundred of Whaleros, rape of Lewes, Sussex, 46 m. S. of London, direct distance. It is chiefly in the par. of Brighton, of which it forms the vestry, both from W. by the road and from W. by the coast, W. into the adjoining par. of Hove. The barracks and a few detached houses are in the parish of Preston, which lies on the N. of both Brighton and Hove. It is bounded on the E. by the parishes of Rottingdean, Ovingdean, and Falmer, none of which contain any houses connected with Brighton. The town occupies only a part of the par. of Brighton, but it comprises nearly the whole of the population. The government is vested in a chief constable and headboroughs, to whom are added commissioners for roads and other local matters. The town is gradually improving, and managing the town. It was constituted a parliamentary bor. by the Reform Act, and returns two members; the bor. consists of the parishes of Brighton and Hove. The pop. within the boundary in 1831 was 41,994. Brighton stands near the centre of the curved line of coast of which the E. and W. points are respectively Beachy Head and Selsey Bill. The town is built on a slope, and is defended from the N. winds by the high land of the South Downs, which from Beachy Head as far as the centre of the town is elevated, and presents fine views of the sea. In the W. part of the town is a high chalk cliff. From the central part of Brighton W. the hills recede farther from the sea, leaving a level coast. Thus the town of Brighton in the E. part presents a high cliff to the sea, and in the W. part a sloping low beach. The soil on the South Downs is calcareous, and the chalk cliffs on the deep slopes and some of the flat tops of the town are very thin; in the hollows and occasionally on other parts it is a pretty good loam, capable of producing profitable
crops. From the nature of the ground and the superior advantage of a sea-frontage, the town has not increased towards the N. so much as along the coast; but it has run up to N. 2½ miles, including the parishes of Knowlton and Lewes respectively are formed. The entire sea-frontage of the par. of Brighton, a space of near 3 m. in length, is occupied with houses, and the line is extending W. into the par. of Hove. The pop. of the town has increased rapidly, mainly owing to the rapidity in the 19th century: in 1801 it was 7393; in 1811, 12,012; in 1821, 24,429; in 1831, 40,634. At present the number of residents during the summer occasionally amounts to 70,000. The number of houses within the town in 1831, taxed at 10s., was 27,731; in 1841, 43,580, and within the boundary 35,580. The place is rapidly and daily increasing.

The range of Brighton is uncertain. Its name is commonly derived from a Saxon bishop supposed to have resided here, named Brighthelm; but this is mere conjecture. Roman coins have been dug up in the vicinity. At the Conquest the lordship of the manor was included in the possessions of Harold, and was given by the Conqueror to his son-in-law, William de Warren. About this time a colony of Flemings are supposed to have established themselves for the purpose of fishing. From the exposed nature of the coast the town has occasionally suffered from hostile inroads, as recorded by the Freemen's Chartel in 1513. During the reigns of Henry VIII and Elizabeth fortifications were erected to protect it. The town has also suffered from storms and the encroachments of the sea, by which the cliffs have been undermined, and at different times houses desolate, the Ward, Bramhams have lately been formed, running from the cliff to low water mark, within which the loose shingle is deposited; the shingle in this part of the channel is always driven eastward. A sea wall is also partly built and still in progress along the E. cliff. During part of the 17th century Brighton is stated to have contained upwards of 600 families, chiefly engaged in fishing. It was from Brighton that Charles II. effected his escape to France after the battle of Worcester, being conveyed across the channel by the captain of a coast brig, who afterwards enjoyed patronage for his services.

About the middle of the 19th century attention was directed to Brighton as a suitable watering-place, and chiefly by Dr. Richard Russell, an intelligent medical man, whose work on the use of sea water created considerable interest. But the progress of the place was slow until it was Romania by Lord Curzon, V. of Evesham, who selected it as his summer residence. In 1784 the foundation of the Marine Pavilion was laid. This royal palace may be regarded as the nucleus of modern Brighton. It is a singular structure. The original design has received many modifications. The inner court is surrounded by colonnades, the exterior is rather fantastic than striking, presenting an assemblage of domes, minarets, and pinnacles. The furniture of the interior is of a very expensive character. The pleasure grounds attached occupy upwards of seven acres. Adjoining the palace is the fashionable promenade of Brighton termed the Steine, which, prior to 1793, was a piece of common land used by the inh. for repairing and drying their boats, nets, &c. It is now a spacious lawn, surrounded by fine houses. On the N. side of it is a bronze statue of George IV.

The rapid increase of Brighton caused the want of a suitable landing-place to be strongly felt. A company was accordingly formed for the erection of a suspension or chain pier, which was begun in October, 1822, under the direction of Captain Brown, and opened in November of the following year. It is composed of four spans or chain bridges, each 255 ft. in length, and at the end, on a framework of strong oak piles, is a platform paved with blocks of granite. The main chains, which are eight in number, are carried on 20 cast-iron towers, which rest on clusters of piles. The entire length of the pier is 1136 ft., the breadth of the platform being 13 ft. This structure, which stood several severe storms uninjured, was seriously damaged in a tremendous gale on the night of the 15th October, 1823. In the third wave, or spume, was broken down, the suspension rods and chains being snapped and dislocated. It has been since repaired.

On the E. side of the par. of Brighton is Kemp Town, a magnificent assemblage of private houses erected on the estate of Mr. Kemp. When first built, a few years ago, it was quite detached from the town, but is now united with it by a bridge over the par. of Hove, in the Brunswick square, one of the best parts of Brighton: beyond this a crescent named Adelaide crescent is in the course of building. Indeed the best part of Brighton may be briefly described as composed of ranges of splendid houses, formed into crescents, built and planned by the architect's precept. The par. of Hove, an ancient edifice, stands on a hill N.W. of the town; the living is a vic., in the archdeaconry of Lewes, and diocese of Chichester; the rec. of West Blatchington, a par. N.W. of Brighton, is annexed to it. The town-hall, begun in 1830, and not finished until 1842, is a large but ill-designed edifice. The places of worship belonging to the Establishment and to the dissenters are numerous. The royal chapel stands on the site of the former assembly rooms or rather the building has there erected to its present use; its internal parts are very fine, particularly the seats appropriated to the royal family. St. Peter's Church, erected in 1827, is a handsome Gothic structure, of Purbeck stone, situated near the entrance of the town by the London road. There are several chapels of ease subordinate to the pariah church. Some of the dissenting chapels are handsome edifices.

The charities consist principally of the poor-house, a well-regulated establishment on the top of Church Hill; the Dispensary and County Infirmary, founded in 1809, under the direction of Dr. John Fothergill, W. of the town; the almshouses near Kemp Town, founded by the earl of Egremont and T. R. Kemp, Esq.; the United Fishermen's Society, for the relief of the fishermen of Brighton; with several other institutions of a benevolent character. Of charity schools there are several, for boys and girls, as well as the Union charity schools, founded by Edward Goff, Esq. in 1805, who left 460l. to the boys' school, and 200l. to the girls', are supported by voluntary contributions; and there is a school founded by Swan Downer, Esq. in which fifty girls are educated, and to which is added a boarding school, for girls to give 158 daily schools, 43 boarding-schools, 14 Sunday schools, and three infant schools. The number of private schools at Brighton is very considerable, a circumstance owing to the salubrity of the place, and the desire of many parents who live in London to send their children out of the metropolis.

The inn, hotels, and baths of Brighton are numerous. There is a chalybeate spring in the par. of Hove, which has been inclosed, and has considerable celebrity. The water has been analysed by Professor Daniel, and is held in high estimation for its medicinal qualities. An establishment, comprising 300 beds, has been established by the Union charity schools, for the benefit of working females, through the agency of artificial mineral waters. Brighton contains several places of amusement; a theatre, an assembly room, a club house, and about a mile E. of the town, on the summit of a beautiful part of the Downs, a fine race-course, at which the take-place on the first Tuesday in July.

The trade of Brighton is confined exclusively to the supply of the wants of a rich population. There is an annual fair on September 4th; the principal market days are Tuesdays, Thursdays, and Saturdays. At the market, which is excellent and abundant, all kinds of fruit, vegetables, meat, and fish are sold. The market was originally a weekly one, held under charter; in 1773 an act was obtained for a daily market. A fish market is also held by the fishermen on the open beach.

There are several promenades erected in the 16th century. The present battery was originally erected in 1739, and rebuilt in 1830.

The gas with which Brighton is lighted is supplied by two gasometers; one to the E. of Kemp Town, the other to W. of Brunswick square. The gas is excellent, and the fire is not suffocating.

About 5 m. from Brighton, by a pleasant road across the Downs, is the Devil's Dyke, an extensive entrenchment, about a mile in circumference, of an oval form, which is conjectured, from the finding of an urn filled with coins of the time of Edward the Confessor, to date back to the Bronze Age.

It is separated from one part of the Downs by a natural chasm, which appears to have been made deeper in order to form a high rampart called Poor Man's Wall. From this height there is a fine view of the Weald of Sussex, and the counties of Sussex, Surrey, and Kent. The ground around Brighton is rough, a number of fine drives and walks.

Since the establishment of steam-boats and the erection
of the chain-pier, Brighton has become a packet station, which is much used by those who prefer going and returning from Paris or London to Dieppe and Rouen, instead of the old route of Dieppe and Calais. The canals of the Grand Trunk road have been projected, and are now (March, 1826) before the public. (Luce's Leves and Brightstonecliff; Dr. Rollan's Nat. Hist. of Brighton; Boundary Reports.)

BRIGNOLES, a town in France, capital of an arrondissement, in the dept. of Var. It is on the river Calami or Calanis, whose waters flow ultimately into the Argens; and on the road from Paris to Draguignan, 513 m. S.S.E. of Paris, 42° 14' N. lat. and 6° 4' long. The town is situated in a hollow, surrounded by wooded-crowned heights. The number of the air was such esteem formerly, that the countesses of Provence were accustomed to resort hither for the purpose of lying-in, and had their young children brought up here. The trade of the town in the early part of the present century, was considerable; it was especially famous for the manufacture of leather. The Dictionnaire Universel de la France (1804) gives the number of tan-yards at forty-two, and adds, that there were seven soap manufactories, seven brandy distilleries, besides manufactories of silk goods, woolen cloths, wax, hats, glue, starch, candles, earthenware, and liquors.

But the trade of the town has probably been much reduced, for there has been a remarkable diminution of the population.

In the work just cited it is given at 9060: in 1832 it was only 5492 for the town, or 3940 for the whole commune.

The country around Brignoles is exceedingly fertile: the wine and the olive are cultivated on the surrounding hills; and the fruits, especially the dried plums, are in high estimation. The population of Brignoles was in 1832 a pop. of 71,662.

BRIMSTONE. [SULPHUR.]

BRINDISI, the Roman Brundisium, and Greek Brennesium (Brynnthion), a town in the prov. of Terra d'Otranto in the kingdom of Naples, 40° 38' N. lat. and 18° 11' E. long. of Greenwich, in Italy. It is situated on the coast of the Adriatic sea, and is a great safe harbor, which was the chief port of embarkation from Italy to Greece. The origin of Brundisium is lost in the obscurity of the ante-Roman times. Tradition spoke of a Cretan colony having early settled here. It was one of the chief ports of the ancient Peloponnesian League, and called Calabria by several ancient geographers. The name of Brundisium or Brundisium is said by Strabo (p. 282) and others to be derived from a word, which in the old Messapian language signified a stag's head, a shape somewhat resembling the double horns of deer. The town is of which forms two horns which half encircle the city. The Brundisians and the other Messapians were often at variance with the Greek colony of Tarentum, before the Romans extended their conquests into Apulia. After the war, the town became the duke of Apulia. But the Brundisians, under the consuls M. Attilius Regulus and Lucius Junius Libo, turned their arms against the other towns of Messapia and seized Brundisium among the rest, about 227 B.C. Brundisium was made a Roman colony.

The Via Appia terminated at Brundisium. (Rome and its Environs.)

The poet Pausanias was a native of this town, and Virgil died here. Pompey, having left Rome at the beginning of the civil war, repaired to Brundisium, where he was besieged by Caesar, who endeavored to prevent his escape to Egypt. The country, young and vast, was the scene of his retreat, on which he was raised, on each side of the entrance. But however he could accomplish his object Pompey embarked his troops in secrecy and sailed away for Greece. To these two piers raised by Caesar the beginning of the deterioration of the inner harbor has been attributed. The harbor, now one of the town, has become very narrow, the sands carried by the sea accumulated and formed a bar across which gradually choked up the entrance, and an isthmus was created separating the inner from the outer harbor, or roadstead. This however was the result of the work of Brundisium after the fall of the Roman empire, when it was taken and retaken by the northern barbarians, the Greeks and the Saracens, contributed to the deterioration of the bar, by preventing the in from attending to its repair. From this it is supposed the bar formed by the town, which is composed of the Angelaeus the inner harbor, was already become a stagnant pool separated from the sea. Other marshes formed themselves in the neighbourhood, and the air of the town became seriously affected. Attempts were made by the Aragonese kings to re-open the communication between the two harbours, but they failed. In the 18th century the pop. of Brindisi was reduced to less than 3000, and was threatened with total destruction by the pestilential state of the atmosphere, when King Ferdinand IV. in 1755 ordered the communication with the inner bar, to be restored. A cut was made across the isthmus, and the sea water being thus let in, and the other marshes at the same time partially dried up, the air of Brindisi evidently improved. (Pigonatti, Memorie del regno di Napoli, p. 492.)

A deep channel has been kept, the current is considerably clear and to cleanse the inner bar, of the mass of sea weeds which accumulate very fast, and by their decay corrupt the atmosphere. (Afan di Rivera, Considerazioni sulle due Sicilie.)

[Coin of Brundisium. Copper. Brit. Mus.]

The present town of Brindisi occupies but a small part of the site of the ancient city. It is surrounded on the land side by walls and ditches, and has a castle called Forte di Terra, commanding the north-east of the inner harbour. Outside the town and not far from the castle is a plain said to be of Roman construction, with a niche on each side, from which flow two rills of very good water, probably the fountain mentioned by Pliny from which the ships were supplied. The water in the town is very bad, but the only well is ill built and looks miserable, and the air is still unwholesome in summer. The pop., which is 6000, carries on some trade by sea; part of the oil of Puglia is shipped off at Brindisi. The principal object of antiquity is a pillar about 50 ft. high, which forms a conspicuous object. Another, which stood near it, has been removed to Lecce, and the pedestal alone remains. The cathedral is a large but not handsome building of the Norman times, with a mosaic pavement. Brindisi is an archbishop's see. It lies about 200 m. E. by S. of Naples, or m. N.E. of Taranto, 40 N. of Gallipoli, and 20 N.W. of Lecce.

BRINDLEY, JAMES, was born in 1716, at Thornsett, a few miles from Chapel-en-le-Frith, in the county of Derby. The great incident of his life was his introduction into the principles of the new system, and the completion of the system to the promotion of artificial navigation. (BRIDGEWATER.)

But he had previously acquired reputation by his improvements in machinery; and at an early age, although deprived of the advantages of even a common education, he acquired a mind fruitful in resources far above the common order. Brindley followed the usual labours of agriculture until about his seventeenth year, when he was apprenticed to a millwright named Bennett, residing near Macclesfield. This individual being generally occupied in distant parts of the country, and not living at home with few or no children, he was enabled to exercise, and to frequently assist his employer by the ingenious improvements which he effected. Mr. Bennett, on one occasion, was engaged in preparing machinery of a new kind for a paper-mill, and although he had inspected a mill in which such machinery was in operation, it was reported that he would be unable to do the work himself, as he had contracted with Mr. Bennett for the work on Monday morning. He had marked the points in which Mr. Bennett's work was defective, and by enabling him to correct them, Bennett's engagement was satisfactorily fulfilled.

When the period of his apprenticeship had expired, Brindley engaged in business on his own account, but he
did not confine himself to the making of mill machinery. In 1752 he contrived an improved engine for draining some coal-pits at Clifton, Lancashire, which was set in motion by a wheel 30 feet below the surface, and the water for turning it was supplied from the Irwell by a subterraneous tunnel 6000 feet long. This was the commencement of skill and ingenuity steadily increased. In 1755 a gentleman of London engaged him to execute a portion of the machinery for a silk-mill at Congleton. The construction of the more complex parts was intrusted to another individual, who, though evidently wanting in the example of performing his portion of the work, treated Brindley as a common mechanic, and refused to show him his general designs, until it became necessary to take Brindley's advice. Brindley offered to complete the whole of the machinery in his own way; and, as the capitalist trusted to the acknowledged abilities of the contractors, he was allowed to do so. The ability with which he accomplished his undertaking raised his reputation still higher. In 1756 he erected a steam-engine at Newcastle-under-Lyne, which was calculated to effect a saving of one half in fuel.

Shortly after this time, Brindley was consulted by the duke of Bridgewater on the practicability of constructing a canal from Worsley to Manchester. Brindley's success in this undertaking was the means of fully awakening public attention to the possible application of steam-power to works of less ability undertaken the work, it is not improbable that it might have turned out a failure, and the improvement of our inland navigation might have been deferred many years longer. The duke of Bridgewater's canal was refitted to the present prospects of a new railroad. Within forty-two years after the duke's canal was opened, application had been made to Parliament for 165 Acts for carrying canals across the Granta Bridge at an expense of above 12,000l. All the ingenuity and resources which Brindley possessed were required in accomplishing the duke of Bridgewater's noble scheme; and it may be fairly said that where there were most difficulties to be met, there Brindley's genius was most manifest. With the greatest exactness and in his expedients for overcoming difficulties that his talents were displayed; he made use of many new and ingenious contrivances for conducting the work with the utmost economy.

In 1766 the Trent and Mersey Canal was commenced under Brindley's superintendence. It is 93 m. long, and unites the navigation of the Mersey with that of the Trent and the Humber. It was called by Brindley the 'Grand Trunk Navigation,' owing to the probability, from its great compass, that a great number of manufactory vessels would be induced to join it. The Grand Trunk Navigation, by means of a tunnel 2880 yards in length, passes through a hill at Harecastle, in Staffordshire, which had previously been considered an insurmountable obstacle to the completion of a canal. The tunnel at Harecastle was 830 feet long; but the work was not completed at Brindley's death; but his brother-in-law, Mr. Henshall, successfully finished it. Brindley next designed a canal 46 m. in length, called the Staffordshire and Worcestershire Canal, for the purpose of connecting the Grand Trunk with the Severn. He also planned the Coventry Canal, but owing to some dispute he did not superintend its execution. He however superintended the execution of the Oxford Canal, which connects the Thames with the Grand Trunk through the Coventry Canal.

The Thames and the Mersey was a work of the first magnitude and establishment on the Thanes, the Humber, the Severn, and the Mersey, and united the great ports of London, Liverpool, Bristol, and Hull, by canals, which passed through the richest and most industrious districts of England.

The canal from the Trent at Stockwith to Chesterfield, 46 m. long, was Brindley's last public undertaking. He also surveyed and gave his opinion on many other lines for navigable canals, besides those mentioned; among others, on a canal from Liverpool to Runoon, where the Duke of Bridgewater intended to carry the Mersey over the ridge of land that rises to the height of 14 ft. He formed also a scheme for uniting Great Britain and Ireland by a floating road and canal, from Port Patrick to Donaghadee; and like most other impracticable schemes of ingenious men, it became a favorite speculation. Phillips, in his 'History of Inland Navigation,' says that Brindley pointed out the method of building walls against the sea without mortar; that he invented a mode of cleansing dock-yards, and for drawing water out of mines by a losing and gaining bucket. Phillips states that he had been in the 'employ of the great Bridley.'

Brindley's designs were the resources of his own mind alone. When he was beset with any difficulty he seduced himself, and worked out unaided the means of accomplishing his schemes. Sometimes he lay in bed two or three days; but when he arose he proceeded at once to carry his plans into effect, without the help of drawing or model. A man like Brindley, who was so entirely absorbed in his own schemes, was not likely to partake much of the pleasures of society. A hectic fever, which had hung about him for several years, at length terminated his laborious labors. He died and was interred at St. Chad's Church, on September 27th, 1772, aged 56, and was buried at New Chapel in the same county.

The principal events in Brindley's life were first commenced to the public from materials furnished by Mr. Henshall, his brother-in-law, and other friends, who spoke highly of 'the integrity of his character, his devotion to the public interests, and the vast compass of his understanding, which seemed to have an affinity for all great objects, and likewise for many noble and beneficent designs which the multiplicity of which, in the opinion of sagacious men, was at one time too much for his life prevented him from bringing to maturity.' No man was so entirely free from jealous feelings. A letter, written while the Grand Trunk Navigation was proceeding, thus describes Brindley's personal appearance:—'He is as plain as a turnip, and almost as useful. The turnip of the year is his own carters; but when he speaks all ears listen, and every mind is filled with wonder at the things he pronounces to be practicable.' The reply which Brindley is said to have given to a committee of the House of Commons, when he was asked whether he was not rather possessed of the art of making men work, viz. 'To teach navigable canals, is characteristic, and very probably authentic; but it was made public by an anonymous writer in the 'Morning Post,' whose communications respecting Brindley were stated by some of his friends to correspond much with what he had said.

(Phillips's History of Inland Navigation; Priestley's Canals of Great Britain; Communications to the Biog. Brit.)

BRINE SHRIMP, or BRINE WORM. [BRANCHIOPODA.

BRIONIC ISLES. These three isls. lie on the N.E. coast of the Adriatic, near the port of Tassano, and N. of Pola, in the Austrian circle of Trieste. They contain the quarries from which the Venetians obtained the ash-grey and white marble which was used in building the walls of the thrones are constructed. The largest of the isls. is called Brioni; the names of the other two are Coseda and San Girolamo. 45° 3' N. lat. 13° 53' E. long.

BRIOUDE, a town in France, capital of an arrond. in dep. de Haute-Loire. The pop. is 1473. From Paris to Le Puy, 271 m. S. by E. of Paris; in 45° 17' N. lat. and 3° 24' E. long.

This town is situated near the left bank of the Allier, and derives its name from an old Celtic word broe, a bridge, or ford (compare Samara). This name however appears to have belonged originally to Old Brioude, which is close upon the Allier, while the modern town is a little removed from the bank. At Old Brioude is a magnificent bridge of one arch, of about 160 ft. span, supposed to have been built by Charlemagne. It was afterwards restored, once much venerated as containing the relics of St. Julian, an early martyr, who was put to death here or at Old Brioude. There were also before the Revolution several religious houses. There are some woollen stuffs manufactured in this town; and in the neighbourhood marble is quarried and coal dug. The pop. in 1833 was 3022 for the town, and 5099 for the whole commune.

Brioude suffered much in the middle ages from the ravages of war. It was laid waste in the fifth century by the Vandals under their king of Meta, and in the ninth by the Saracens, and again successively by the nobles of Auvergne, by the English, and in the civil wars of the sixteenth century by the Huguenots.

The arrond. of Brioude had, in 1831, a pop. of 80,992.

BRISGAI, THÉ, or BRISGAI, in the S.W. part of Swabis, is bounded on the N. by the Orneaux, on the E. by the Black Forest, on the S. by Switzerland, and on the
W. by the Rhine, and is now included in the circle of the Upper Rhine, in the Grand Duchy of Baden. It was originally a landgraviate belonging to the dukes of Zähringen: it then passed into the possession of the dukes of Hochberg, and in 1567 was sold to the house of Habsburg. Rudolph of Habsburg, in 1536, married the daughter of the Landgrave of Hessen-Cassel. The town, deriving its name from the forest, which, in the French language, signifies "bush" or "thicket," was born in the castle of Limbourg, in this territory. It comprised an area of about 1260 sq. m., and contained about 14,600 inh., inclusive of a district called the Ortenau, which had a pop. of about 16,000. The Brisgau is traversed by numerous streams, and is traversable by the Rhine, which, adjacent to the Rhine, where the surface is level and the soil highly productive: here large quantities of grain, flax, hemp, fruit, vegetables, wine, &c., are raised. In the other parts flocks and herds are reared to a considerable amount, much iron is smelted, and metal is manufactured in abundance. Paper, and lead, are worked. The inh. of the forest-districts are celebrated for the manufacture of wooden clocks and other articles of wood. The revenue which the Brisgau yielded amounted to about 58,000£. per annum. By the treaty of Luneville, in 1801, Austria ceded a small portion of this possession (the Frickthal, on the left bank of the Rhine) to France, which afterwards relinquished it to Switzerland; and gave up the remainder to the Duke of Modena as a compensation for the loss of his territory in Italy. In 1802, the Duke, by this law, the Archduke Ferdinand of Austria, as Duke of the Brisgau; but in 1805, by virtue of the peace of Presbourg, it became the property of the then Elector of Baden, with the exception of a small tract assigned to Württemberg, which had been acquired by that kingdom. The county, consisting of fourteen towns, including Freiburg the capital, Old Breisach, Waldkirch, Kehlingen, Eningen, Staufen, and St. Blasien; and 450 villages and hamlets.

BRISSON, BARNABÈ, was born at Fontenay-le Comte in 1727. He was first a seaman, several years he had distinguished themselves at the French war. Brisson applied to the same profession, in which he attained the highest honours. He was made king's advocate in 1757, afterwards counsellor of state, and lastly president a mortier in 1783. He was a man of great abilities, and his writings could boast of having in his service so learned a man as Brisson. He sent him on several missions, among others to Queen Elizabeth of England; and he commissioned him to collect and edit the ordinances of his predecessors and his own, which appeared under the following title—"Code de Henry III. Roy de France et de Pologne, redigé en ordre par Messeire Barnabè Brissone, fol. 1687, afterwards republished with additions under Henry IV. by Le Caron, 1699, and commonly called Code Henri Brissone. He was well versed in all the natural sciences then known, and the result of his studies. 1. 'De verborum quae ad jure pertinent significations,' a useful glossary of words and sentences of the Roman law. This work went through several editions; the one by C. J. Citer, fol. Frankfurt, 1683, contains many additions. 2. De sollicitudini et sollicitudinis legis et legum, lib. viii., fol. 1583, a work of more general use to scholars. The author explains the proper meaning and application of certain established forms of words which had a fixed meaning, and were used by the Romans in their public acts, in their religious ceremonies, in the senate, in the consuls, in the forum in their contracts, testaments, funerals, &c. An improved edition of this work was published by F. C. Conrad, fol. Leipzig, 1781, with a life of Brissone prefixed to it. 3. 'De regio Persarum principatu,' lib. iii., in which he treats of the code of Persia, especially the political institutions of its laws, the religious aspect has, of the theophrastians, their military establishment. An edition with notes and corrections was published by Professor Lederlin, Strasbourg, 1770. Several other works of Brissone, chiefly connected with the Roman laws and institutions, are found in his Operae Variae, Paris, 1688, and his Commentarius, Leyden, 1749, with the title of 'Opera Minora,' which contain 'Selectarum ex jure civilis antiquitatum,' lib. iv.; 'De ritu nuptiarum,' 'De jure coniubiorum; 'Ad legem Juliam de alienis; 'De solutionibus et libertationibus; 'Ad legem Dominico de matrimonii, lib. vi., and 'Historia verborum liber singularis;' all works of considerable erudition. The end of Brissone's life was remarkably unfortunate. When Henry III. was obliged to leave Paris on account of the facts of the League in January, 1688, Brissone stayed behind, in the hope, as it would appear, of bringing about a reconciliation between the king and the people of the capital. After the murder of the Guises, the leaguers being now in open revolt against the king, arrested, Jan. 1589, the President de Harly, and put Brissone in his place as first president of the parliament, which he accepted, as he did to his friends, in order to save his life and that of his wife, to which end he afterwards pressed privately before two notaries against any interdiction on his part. Henry III. having by an edict of February, 1589, transferred the parliament to Tours, Brissone did not obey the summons, but remained in the capital. After the arrest of the mayor of the same year, Brissone proclaimed the duke of Mayenne, called of the League, lieutenant-general of the kingdom. But he resisted the intrigues of Mendoza, the Spanish ambassador, who wanted to obtain the regency for his master, as well as the pretentions of Carondelet, the pope's legate, who on presenting to the parliament his bull of indulgences wished to take the seat reserved for the king. However Brissone soon after became suspected by the faction of the Sixteen who ruled in Paris, and who thought that he was favourable to Henry IV. Availing themselves of the absence of the duke of Mayenne, they arrested Brissone, and sent him to Tours, on 15th Nov., 1591, at 9 o'clock, and banged them at 11 o'clock the same morning. The Duke de Mayenne on his return to Paris hanged four of the most violent of the Sixteen, that is, of the cabal. (See De Thou, and Dauze sur la mort du President Brissone, par Denaye de Vigny, etc., au seigneur, Paris, 1595.)

BRISSON, MATTHURIN JACQUES, whose zoological and philosophical works have rendered his name dear to France, was born at Fontenay-le-Comte on the 30th of April, in the year 1723. Educated at school, he is said to have been, under Reaumur (for his youth was passed in aiding the labours of that accurate observer of nature, and in superintending his cabinet), he imbibed, at an early age, a love for natural science, which only left him with his life.

His progress must have been rapid; for we find him selected as the tutor in physics and natural history to the 'children of France,' and filling the office of 'Censeur des Sciences.' He possessed in a high degree of other qualities, such as talent and eloquence, and endeavoured to pull down Priestley; but he, notwithstanding, fairly stated to his class, in his capacity of professor, the new theory which had taken the place of that of the Abbé, explaining and discussing the facts on which it rested.

The government charged him with the care of providing lighting-conductors for the protection of many public buildings, and appointed him to examine those which other projectors might bring forward. On 13th July, 1775, he resigned his post at Broisi, near Versailles, on the 23rd June, in the year 1806, at the age of eighty-three; but some months before he died he was a melancholy example of the body surviving the intellect. An apostate aesthetic had defaced all his ideas, depriving him of the knowledge which he had so laboriously acquired, and even more agonizing from his memory the French language. It is a painful but striking proof of the endurance of those earliest impressions which are stamped upon the infant mind, that his only recollections in this distressing state consisted of a few words of the proper names with which he had heard from his nurse and from his first accents.

His works are numerous: among the most important are his on the comparative gravity of bodies. The first appeared at Paris in 1760, in 6 vols. 4to., in Latin and French. The second, under the title of 'Faune d'Europe,' was published in quarto in 1767.

BRISSOT, JACQUES PIERRE, was born on the 14th of January, 1754, in the village of Ouarville, near Chartres. His father, though only a poor pastry-cook, contrived to give his children a good education, with the intention that Jacques Pierre, who as a boy gave signs of great talent, should be brought up to the bar, but the youth's early passion for literature defeated this project. Brissot was particularly fond of the study of languages, and made himself a perfect master of English: he eagerly devoured the best authors, turning his attention more especially to
the historians, economists, and political writers. On retaining
the age of manhood he quit the study of law and went to the
Netherlands, where he became a member of the States of
the 'Duchy of the Eron.' This liberal journal was
soon arbitrarily suppressed by the French government, and
Brisot was thrown upon the world with no other resources
than his acquirements and abilities.

This was the dawn of the Liberal era. Brisot's Treatise on
Criminal Laws; and the next year two eloquent discourses on the same
subject gained him the prizes in the Academy of Châlons-sur-
Marne. Between the years 1782 and 1786 he put forth ten volumes
of 'The Philosophical Library' on criminal laws. At the same time he studied the institutional law, and was de-

volumented as part of his time to metaphysical pursuits, in which
latter department he published an essay, entitled 'On
Truth, or Meditations on the Means of Reaching Truth in all
branches of Human Knowledge.' During part of this time he was imprisoned, and was wounded, on the occasion of
the massacre of the March 1784, where about the year 1783, that he undertook a periodical work, called 'Universal Correspondence on all that concerns
the Happiness of Men and Society.' The laudable object
of this work was to disseminate in France all such political
principles as were based on reason. The constitutional laws
and usages of England formed a leading topic. The French
government seized and suppressed the book. His next
works were 'A Picture of the Sciences and Arts of Eng-
land,' and another on British India.

During the ministry of the day arrested, he threw him into the Bastille. His imprisonment
was not of long duration, but in obtaining his liberty he
was compelled to give up an Anglo-French work, which was
to have been written partly by Englishmen and partly by Frenchmen, in defence of the

dissections inflamed his hatred of arbitrary power. In 1785,
during the insurrection of the Wallachians, he published two
letters, addressed to the Emperor Joseph II., 'On
the Right of Emigration,' and 'On the Right of Insurrection.'
It is common to the Englishman and the Frenchman,
both in his works possessing only a temporary interest, have long
since fallen into oblivion. He warmly favoured the revolu-
tionary party in the English North American colonies, and
wrote a good deal in support of their cause. He was an
eminent and powerful leader of the French society called
'The Friends of the Blacks.'

The freedom of his pen brought him again into difficulties,
and on learning that a lettre-de-cachet was signed for his
arrest, he fled and took refuge in England. After a short
stay in London he disembarked in the Atlantic to the United
States, where his love of republican institutions was in-
creased by seeing their operation in that country.

In 1789 the progress of events in France enabled him to
return home, and use his pen without any fear of the Basti-
ille. In 1787 he was elected to the first municipal council of
the city of Paris, and in that capacity received the keys of the
captured Bastille, on the 14th of July. Soon after he was
elected by the citizens of Paris to be their representative in
the Convention of the 13th August. He joined the party called
the Girondins, and co-operated with Vergniaud, Guadet, Gen-
doncé, the Provençal Isnard, and others, who were weak
and imprudent politicians, but among the most eloquent and best
men in France. 'The opinions of Brisot, who desired a com-
plete and absolute revolution, were, as is well known, those of
re-producing himself in the journal called 'The Patriot,'
at the tribune of the Assembly, in the club of the Jacobins;
his precise and extensive information respecting the situa-
tion of foreign powers, gave him a great ascendency at a
moment of struggle between the Jacobins and the nation or
the Girondists, as the Girondists had gone farther than the
Feuillants. The Girondins were nothing more in the revolu-
tion than a party of transition from the power of the muddling
colossus of society to that of the mob. The members of it
put themselves and their country in a position from which
there was no escape except through seas of blood. During
the fearful struggle Brisot incurred the deadly hatred of
Robespierre, which was equivalent to a death-warrant. On
the 20th of June 1793, he was placed in a cell of the Presi-

dence of arrest was passed against him. Brisot was calm and firm, and at first not
inclined to do anything to escape death, but on the entreaties of his family and friends he attempted to get
back to Switzerland, where the Swiss government con-

BRISTOL, a sea-port town in the West of England, is
in 51° 27' 6" N. lat., 2° 35' 28' W. long., 108 m. from
London and 313 from Edinburgh, direct distance, between
the counties of Gloucester and Somerset, and at the junction
of the rivers Avon and Severn, 150 m. by the course of the
water, or 7 m. in a straight line from the
spot where the Avon enters the Bristol Channel.

Etymology of its name.—The most ancient name of
Bristol on record is Caer Odor, the city of the gap, or chasm
through which the Avon flows, but the form of it,
and to this was added the local description of Nant Baddon,
in the valley of the baths. Much diversity of opinion has
existed with regard to the etymology of its present name,
Bristol; and much of this uncertainty probably arises from
the looseness of its orthography in ancient documents.
Seyer, in his history of Bristol, has enumerated 47 varia-
tions, mostly from different, some from the same authorities;
and even these are not all. But the only modes of writing
the name that are material, as serving to lead to the ety-

mology, are those which are derived from the Celtic
words 'brach,' 'breach,' 'branch,' 'bridge,' 'bank,' 'brea,'
't'au,' etc., a stream: a derivation entitled to some credit.
With regard to Bristow, Chattevon derives it from Bristoce, the last king of Wessex,
who commenced his reign a.d. 764, and died by poison a.d.
800, supposing it to have been originally called Britectrius.
It appears also that Bristow, or a similar name,
prevailed from 1064 to 1204; and it is remarkable that a Britric
was Lord of Bristol at the earlier of these two dates. But,
notwithstanding this instance of the name, the etymology of
the name seems by far the most probable. The Saxon
word 'bric' signifies a break, a breach; and 'bric' would be
thus a literal translation of Odor; dropping then the
British prefix 'caer,' and substituting the Saxon suffix
of 'stow,' we should have Bristow. 150 m. in the origin of
the name seems by far the most probable. The Saxon
word 'bric' signifies a break, a breach; and 'bric' would
thus be a literal translation of Odor; dropping then the
British prefix 'caer,' and substituting the Saxon suffix
of 'stow,' we should have Bristow. 150 m. in the origin of
the name seems by far the most probable. The Saxon
word 'bric' signifies a break, a breach; and 'bric' would therefore be a literal translation of Odor; dropping then the
British prefix 'caer,' and substituting the Saxon suffix
of 'stow,' we should have Bristow. 150 m. in the origin of
the name seems by far the most probable.
of Cornwall, whose jurisdiction extended over all Somersetshire and part of Gloucestershire. It is recorded in Ellis's 'Specimens of Early English Romances,' that 'a vast army of the Northumberland country was led by the Duke of Northumberland, and defeated with 30,000 men, in which they were so completely defeated that not five of them escaped.' Whatever may be thought of this tale, or rather of its authority, it is impossible that Bristol could have escaped from a strife which raged for 11 years. The Normans maintained its independence until the invasion of Crida, who in 584 totally subdued the country upon the Gloucestershire side of the Avon, and erected upon the ruins of the ancient governments the Saxon kingdom of Mercia, of which it is to be presumed that the Brictians formed the principal fortresses bordering upon the neighbouring Saxon state of Wessex, and divided from it by the Avon. Caer Odor had now become Bric-stow; and in 996 Jordan, the companion of Augustine, in his mission for the conversion of the Anglo-Saxons, sailed up the Avon river. The bishops' palace at Bristol, which subsequently became the site of the monastery, built in honour of the chief missionary, and now the cathedral church of Bristol. In 936 Bristol was held under Athelstan by Ailward, as Lord of the Honor. Ailward was a Saxon nobleman of considerable power and wealth in the adjoining counties; he was succeeded (980) in his lordship by his son Algar. Upon the coins of Canute the name of the town first appears as Bric and Bricstow; so that at this date (1017) it must have possessed some importance. Indeed in reference to the purpose of the Agincourt Expedition, the coins of this time and of the confluence of the Severn and Wye are to be dated; for we find that upon the condemnation of Earl Godwin (1053) his sons Harold and Leofwine escaping to Bristol, thence embarked for Ireland; and that after their reconciliation with the king, and the employment of Harold by the Normans as a body of men on board his ship from Bristol, the body of men on board his ship from Bristol. We gather also from the life of Wolstan, who was consecrated Bishop of Worcester A.D. 1062, that Bricstow was, from its convenience as a port, especially for embarkation for Ireland, used commonly for the purpose of exporting slaves: a practice which Wolstan denounced to the Conqueror, who forbade, but failed utterly to extinguish, the inhuman traffic by a royal edict. On the accession of William, Bricstow then held the honour in succession from his father Algar; but his son Eadwulf, who was killed in the battle of Wedmore, in Winchester Castle, where he died. The profits of the Honor the king gave to his queen, and resumed them at her death. To the early part of the Norman period the addition of the second wall around the town is ascribed; probably it was built together with the castle by Godfrey bishop of Coutances, in Normandy, and of Exeter, in England, who followed the Conqueror to this country. The castle is not mentioned by name in the Domesday Book, compiled 1086; and the first historical notice of it occurs in the Chronicles of John, 16th year of Henry II. It was held by Godfrey on behalf of Robert, the Conqueror's eldest son. It must at that time have been a place of considerable strength, for the insurgents in the west made it their head-quarters, bearing thither all the plunder accumulated in foraging the adjoining counties, until, on the final success of Rufus, Godfrey retired into Normandy, and the king, in whom the honor then was, conferred it upon his cousin Fitzhamon. By referring to Domesday Book, we shall be enabled very readily to trace the actual position of Bristol in the 11th century; but the correct elucidation of the complication the burgesses of Bristol are repeatedly referred to; Bristol then was a burgh or walled town: it is also recorded that the burgesses paid to the king in reserved rents, fines, customs, and tolls, 57l. 6s. 8d. It follows that it was a royal burgh, the tenants in which held for the most part immediately under the king. [Borough, p. 195.] The local government of the city was vested in a preposito or chief magistrate, who acted under the custos of the castle, the capital honoriae, the constable of which was either the lord of the place or of the castle. It is his individual holding under him or the king. It does not appear that the preposito was a salaried officer, although, as he was de virtute officii esclusor to the king, his reasonable charges on that head were defrayed; but the town was charged with the manor of this last time. Last of this commune, as it is recorded in Domesday Book as paid to the king, there is this item,— And to the Lord Bishop [Godfrey] £28, which was the precise sum annually paid by the town to the constable of the castle for several subsequent reigns. The preposito, at the accession of William I., was Hardying, a wealthy merchant of the town, and the founder of the Berkeley family. He was continued in his office by the commonalty, and assented to the first conquest of Wales, and was rewarded there, as was his son Robert, with the Castle of Monmouth, and the Marcher barony of Hereford, and assented to the first conquest of Wales, and was rewarded there, as was his son Robert, with the Castle of Monmouth, and the Marcher barony of Hereford, and seems to have acknowledged the nearly-separate jurisdiction and a preposito of its own. It was called the Vill de Radcliffe, and was in every respect the rival of the neighbouring town until the two were incorporated. The estimated number of houses contained in Bristol in the 11th century was 960, and it is said that the city could not have far exceeded 3000. To Robert Fitzhamon the grant of Rufus appears to have been absolute. Robert founded the abbey of Tewkesbury, conferring it on the church of St. Peter at Bristol, and a tithe of the rents of the town; but the church of the ancient map attached to the Honor, and bearing somewhat onerously upon the townsmen, who were charged with checking the turbulent Welsh, he conquered the co. of Glamorgan, making Cardiff his capital. He died 1107, leaving his three daughters to the wardship of Henry of Antioch, to which he had, on the death of Rufus, transferred his allegiance. Henry gave the eldest daughter, Mabille, in marriage to his natural son Robert, on whom he conferred the Honor, creating him first (Norman) Earl of Gloucester: the annual revenue of the Honor was £300, the revenue of Cardiff £200, the money of the time. Robert Earl of Gloucester has been justly esteemed the first man of his age; and to his care, after the capture of Duke Robert of Normandy (1125), Henry confided his unfortunate brother, whom the earl for a time sheltered at his castle. Cardiff, where a body of men on board his ship from Bristol. We gather also from the life of Wolstan, who was consecrated Bishop of Worcester A.D. 1062, that Bricstow was, from its convenience as a port, especially for embarkation for Ireland, used commonly for the purpose of exporting slaves: a practice which Wolstan denounced to the Conqueror, who forbade, but failed utterly to extinguish, the inhuman traffic by a royal edict. On the accession of William, Bricstow then held the honour in succession from his father Algar; but his son Eadwulf, who was killed in the battle of Wedmore, in Winchester Castle, where he died. The profits of the Honor the king gave to his queen, and resumed them at her death. To the early part of the Norman period the addition of the second wall around the town is ascribed; probably it was built together with the castle by Godfrey bishop of Coutances, in Normandy, and of Exeter, in England, who followed the Conqueror to this country. The castle is not mentioned by name in the Domesday Book, compiled 1086; and the first historical notice of it occurs in the Chronicles of John, 16th year of Henry II. It was held by Godfrey on behalf of Robert, the Conqueror's eldest son. It must at that time have been a place of considerable strength, for the insurgents in the west made it their head-quarters, bearing thither all the plunder accumulated in foraging the adjoining counties, until, on the final success of Rufus, Godfrey retired into Normandy, and the king, in whom the honor then was, conferred it upon his cousin Fitzhamon. By referring to Domesday Book, we shall be enabled very readily to trace the actual position of Bristol in the 11th century; but the correct elucidation of the complication the burgesses of Bristol are repeatedly referred to; Bristol then was a burgh or walled town: it is also recorded that the burgesses paid to the king in reserved rents, fines, customs, and tolls, 57l. 6s. 8d. It follows that it was a royal burgh, the tenants in which held for the most part immediately under the king. [Borough, p. 195.] The local government of the city was vested in a preposito or chief magistrate, who acted under the custos of the castle, the capital honoriae, the constable of which was either the lord of the place or of the castle. It is his individual holding under him or the king. It does not appear that the preposito was a salaried officer, although, as he was de virtute officii esclusor to the king, his reasonable charges on that head were defrayed; but the town was charged with the manor of this last time. Last of this commune, as it is recorded in Domesday Book as paid to the king, there is this item,— And to the Lord Bishop [Godfrey] £28, which was the precise sum annually paid by the town to the constable of the castle for several subsequent reigns. The
find that the burgesses were exempted from pleading or being imprisoned without the walls of the town, except in cases of foreign tenure, in which the town had no jurisdiction; from the fine levied by the lord in the hundred, in which case the burgesses were not liable; from the payment of dues levied in the town on the sale of wines, which were not less appealed to on the death of a stranger killed within the walls: that no one could take an inn (hospitalium) within the walls without leave of the burgesses; that they were exempt from toll, lassage (privileged portage), pontage and all other customs throughout the lord's land; and that they could not be condemned in money above 40s.; that the hundred court was held once in the week, and that the burgesses had power of recovering all debts, &c., throughout their lord's land; that lands and tenures within the town were to be held according to the customs of the place, and that pleas with regard to all debts contracted in the town must be there held; and that in case of tolls taken against the charter, the prepositus could enforce restoration by seizure; that strangers within the town could not buy leather, corn, or wool, but of a burgess, nor sell wine except from a ship, nor cloth except at the fair, nor remain in the town to sell goods longer than 40 days; that no burgess could be elsewhere detained for any debt except of his own or of one for which he had become surety; that he could marry without the license of his lord, and that the lord had no wardship only so far as regarded the lands in his own fee; that no one could take tene (a tax levied in kind in those primitive times ad libitum) except for the use of the lord; that the burgesses could grind their corn where they chose, and could buy wine in their own vessels, and sell it to their servants; and that they were allowed to have all their reasonable guilds. These existing privileges the charter confirms: it grants in addition the privilege of holding property in free burgage on land-gable service (payment of service); of buying, selling, and keeping fish upon the banks of the river and upon the other void places of the town. This may serve to show us what the feudal system was, as well as to indicate very nearly what was the social position of Bristol at the time the whole of these privileges were confirmed to the burgesses.

On the accession of Henry III. he was crowned at Gloucester, and the barons being then in arms against the tyranny of the late king, Henry came with his retinue to Bristol for greater security. Here a reconciliation was effected, and an important altercation took place in the municipal government of the town. Hitherto the only local magistrate appears to have been the prepositus, who also seems to have acted as the king's manorial steward; but now the privilege of choosing a mayor and two prepositi was granted to the burgesses. At the same time the burgesses themselves, for eight years, at the advanced rent of 24s. per annum, saving to the king certain bailiffs in the suburbs, and of the pruning of beer so much as should be necessary for the use of the constable of the castle and his people—except for his men and the burgesses. But the rents and profits so leased did not comprise the whole of the revenues of the town; for in the charter roll for the 11th of this king's reign, preserved among the records of Chancery, it is written that the king had granted to Jordan Lawrance and his wife and all the burgesses and freemen of the town and for the weighing of wool and merchandize) in the town of Bristol, for the 'service of 10s. per annum.'

In the 26th of his reign the king again farmed the town to the burgesses for a term of twenty years, at a rental of 24s.; and at the termination of ten years the leases was renewed for a term of sixty years, at a rental of 26s. 13s. 4d. The course of the river Frome within the town had previously been to the E. of its present channel, so that it passed through a part of the town called Baldwin Street, jutting down below the level of the ground, until those parts now occupied by Queen Square and the quay were converted into a marsh; and the anchorage was confined to a small stretch of quay above the bridge, where the vessels lay on a rough and stony bottom, with a very strong current. The river, therefore, the port had now however outgrown the extent of this quay, and the burgesses resolving to cut a new course for the Avon, the ground necessary to the purpose was ceded to the mayor and commonalty by the abbot of St. Augustine's for the sum of ten marks. The work was commenced in 1339, and completed about the year 1247. The extent of quay obtained by this spirited proceeding was about 40 feet deep and 40 yards wide, at a cost of 5000l. For the completion of this undertaking, which for its day well deserves the title of great, the burgesses of Bristol obtained a writ of mandamus from the king to the burgesses of Bideford, requesting permission to send a man to them to be shown at their city hall, to receive the said writ, and its completion both vies, were by royal charter incorporated into one. A stone bridge was immediately commenced for the better means of communication between the united towns, the wall of the town was extended so as to embrace the new district, and to us up all the customhouses which, from the thirteenth to the sixteenth century, almost supplied England with cloth, glass, and soap. In the year 1243 it is recorded that the latter article of Bristol manufacture was first sold in London.

During the unsettled state of the kingdom in the reign of Edward II., consequent upon the quarrel of the king with his barons, the town was for some time held by the citizens against the sovereign, and the royal authority completely set aside. This rebellion originated in an alleged attempt of fourteen of the principal citizens (de magnificis) to usurp the management and disposal of the corporate funds, to the exclusion of the burgesses at large, in whom the right was a usurpation which was resented by the burgesses, who complained also that a custom called cocked was levied by the sheriff often and to their great cost, and made no appeal to the king, a special commission of Oyer and Terminer was issued to inquire into the case; but the commission was objected to by the popular party, on the ground that foreigners (that is, persons not burgesses of Bristol) were put on juries, and that any proceeding arising during its sitting in the Guildhall, the commissioners narrowly escaped with their lives. The parties indicted for this offence, refusing to appear before the king's justices at Gloucester, were outlawed; and the burgesses declined to pay sums exacted from the town, seizing upon their property, and collecting the king's rents and customs to their own use. The rebellion began in 1311; and the town 'held its own' for the space of four years, during which time it continued to exist, a little republic in the heart of a great monarchy, if a sovereignty so torn with dissensions can properly be termed great. The local government was carried on according to its ancient form, with this exception: the burgesses held the authority of the castle at defiance, and, for their better security, built against its foundations of stone. The castle, with its immense thickness, have been recently discovered in making excavations on its site in Dolphin Street, antiently, from this fact, termed Defence Lane. In the spring of 1314 the city was invested on the part of Edward by the earl of Gloucester and the earl of Surrey, and the chieftains of the shire and castles of Somerset and Devon, under the command of John, earl of Warwick and John, earl of Gloucester, and Sir John de Walworth, and the archbishops of Canterbury and York, and the sheriffs and chieftains of the adjoining counties of Somerset, Gloucester, and Wilts, under wriis issued in the midsummer of the preceding year; but the townsman, encouraged by their mayor, John le Taverner, stoutly resisted his besiegers, and the king requiring men for his Scottish wars, the siege was raised. About the latter end of 1316, the burgesses refusing to submit without a full admission of their ancient privileges and exemption from the obnoxious tax, the town was again besieged, and, after a few days' resistance, surrendered, and the town was punished for its rebellion. The mayor was reinimated, and a general pardon was procured from the king on the payment of a considerable fine and the arrear of the cockett. The only charter of this king to the town was one granted in the 15th of his reign, in confirmation of 28th of Edward I.

In 1237, the year succeeding the succession of Edward III., the castle and borough of Liverpool were together taken to be worth 30s. 10s. per annum; while three years afterwards the town of Bristol was farmed at a rental of 24s. In the 34th year of his reign the king granted to his burgesses, without the payment of receiving, for the term of four years, a custom on goods coming to the town for sale, in aid of repairing its walls. The articles taxed will show the nature of the traffic at that time: they consist of live stock, agricultural produce and wine, wool, and cloth. To this time also belong 'Irish Galway cloths,' salt, ashes, honey, iron, lead, alum, brass, tallow, millstones, copper, leather, oil, and wood. The copy of this grant is still preserved among the records.
of the Court of Chancery. In the 5th year of his reign Edward granted a charter to the burgesses, confirming 31st of Henry III. and 15th of Edward II., and providing, that to prevent waste and fraud the mayor should have ward over the manufacture of cloth, and the burgesses should have view of frank-pledge in the suburbs of the town; a privilege of some importance, as the right of the town to hold court in Redcliff Street was contested by the lords of Berkeley. For the encouragement of the home manufacture of cloth, the use of the foreign articles was, in 1337, expressly forbidden; and of the promise of golden profit which the prohibition held out Bristol appears to have availed itself with great spirit. Some of the principal townsmen erected looms in their dwelling-houses, and on a tax being levied on the new local powers, it was relieved from so impolitic an impost on petition to the king. In the 13th of Edward III. the parliament having granted a subsidy of 30,000 sacks of wool, London was rated at 503 bags, Bristol at 63, and York at 49; and in the 27th of the same reign a wool staple was fixed at Bristol, and the trade was prosecuted with such activity, that the suburbs of the town became peopled with the makers of cloth. The trade continued to prosper until the reign of Henry VIII., when cloth of Bristol was held in high esteem; and it lingered about the city till 1739, when the electoral body of freemen, in number 3899, then residing within the town contained 300 weavers: the trade has since altogether retired into the adjoining counties.

Reverting to the history of the town during the reign of Edward I., we see that in 1338, the king requiring vessels of the several ports for the defence of the kingdom, Bristol was commanded to furnish 24 vessels, and Liverpool one small bark. In the war with France, which commenced in the spring of 1344, 645 men were embarked in 114 ships, and also, in 1346, a detachment of 20 vessels with 600 mariners, and London the same number of vessels with 562 mariners.

A most important step in the municipal history of the town was taken at this time. A charter was granted in the 47th of Henry IV., 1399, to the mayor and burgesses, a new chartal, in which was confirmed all the rights and liberties of the future mayor, by virtue of his office, be escheator, that the burgesses should annually choose three persons, out of whom the king should select one to be sheriff; and that these might account at the king's exchequer for the issues out of the office, and that the mayor and sheriff should hold their monthly court, and to collect the profits therefrom to the use of the commonality; it was also provided that the new mayor might be sworn in before his predecessor instead of the constable of the castle as heretofore, and the sheriff before the mayor; that the burgesses might hold the gaol, and the mayor and sheriff have cognizance of all pleas, and hear and determine all felonies, saving all fees, and the jurisdiction of the Tolsey Court to the crown; that the mayor for the time being should have the power to make laws and regulations for the peace and quiet of the town, and the security of the burgesses and other persons, and to put them in execution; that the town should not be burdened to send more than two burgesses to parliament; and that in cases to which existing privileges and customs did not apply, a remedy should be provided by the power of local taxation be possessed by a council of 40, to be elected from time to time by the mayor, sheriff, and commonality of the town, the money so to be raised to be expended for the necessities and profits of the town, by two honest men chosen by common consent for the purpose, and the mayor and others so elected for the purpose by the commonality of the town. By this important charter the jurisdiction of the castle was confined to its own precinct; and the independence of the town was at once established.

These charters were granted to the burgesses by Richard II.; the first two are merely confirmatory of preceding privileges, and were given in the 1st of his reign (1377), in which year also a royal grant for manure, for the space of ten years, was made. The new articles of traffic on which imports are granted in this document, a copy of which is still preserved in the records of the Court of Chancery, are timber, coal, bark, flax, hemp, pitch, tar, wax, pepper, fruit, and sugars. It is to be observed that in the 19th year of the king's reign, provides that, on royal visits, the king's steward and marshal shall not exercise their offices in Bristol. The value of this privilege will be understood when the reader is informed that the jurisdiction of these offices within the verge of the king's residence was superseded all others. In the previous year (1395) the town was granted to the mayor and commonality, for the space of twelve years, at a rental of 100l., chargeable in addition with certain expenses for the support of the castle and the keeper of the gaol and forest at Kingswood.

A charter granted in the 24th year of his reign by Henry VI. exempted Bristol from the jurisdiction of the Admiralty in consideration of 200l. freely granted to the king in his necessities. The value of this privilege will be understood when it is explained that the Court of Admiralty was claimed to determine all cases occurring super altum mare, and that at this period the trouble and expense of prosecuting a suit in the metropolis were infinitely greater than at present: by the charter an admiralty jurisdiction was granted to the local municipal body. In 1397, in the reign of Henry VI. Clement Bagot, the then mayor and escheator, rendered in an account to the Exchequer, still preserved among its records, which enumerates the various sources of revenue which constituted what was called the exchequer of the town of Bristol, which was such as what was the state of commerce. The most important part of this revenue arises from a custom on merchandise. It appears that Bristol had at this early date extended its commerce along the whole W. coast of England, to South Wales and Ireland, and to the Low Countries. The trade of the town, the collection of vessels attempted is into ships and boats; of the former are reckoned 66, of the latter 64; but many of them, from the amount of their cargoes, must have been of large tonnage: 13 ships and 10 boats are distinctly stated to be weighed, and the cargoes of goods which they have had parts of cargoes on board having the same destination. The exports by this account appear to have been 500 dozen of cloths, 7 tons, 6 cwt., 4 pipes, and 1 cask of iron, 400 pieces of glass, and 10 gross of cutlery, with various quantities of honey, meath, alum, pitch, wine, salt, fish, and cardys (corndryfis). The imports are infinitely more numerous; and among the most material are 12 tons of iron; 10,600 bales of linen cloths (Irish); 829 pieces of tin, averaging 2 cwt. to the piece; 10,575 lamb-skins; 2539 goat skins; 865 calf skins; 693 calf hides; 7360 leather; 3380 ox hides; 1340 aurei; 900 barrels of hides; 39,000 fish in bulk, and 1197 packages, principally barrels and pipes of salmon and herrings; 110 barrels of salt; 12 ton of wine; 43 pickers of leather and some others, including oil and about 200 packages of food. These were the quantities counted for on these exports and imports is 212. 1s. 10d.; for merchandise entering in and going out through the gates of the town, 8l. 17s. 10d.; for the fines and amortizations of the following: and for the mills, 9l. 14s., which, with the landgages and rentals of tenements, give a royal revenue from that source amounting to 60l. 14s. 4d. But this income appears to have been very unequal; for in the three successive years these rents and lifts severally amounted to 62l. 3s. 2d., 116l. 8s. 5d., and 104l. 14s.

Custom was the autentick toll or customary payment at the port and gates of a town; and as there can be no doubt that here it was identical with the present town dues, from which, if the borough be exempt, it would follow that these imports and exports were levied as a tax on the trade only which lay in the hands of individuals not free of the town. This may account for the absence of many articles in the list known to have been then imported, and for the charge of these we must refer to the king's accounts. It is certain that a more productive tax was collected under a similar name, and probably payable alike by citizen and stranger; for when at this same date parliament granted a sum for defraying the expenses of the king's household, 212. 4s. 4d, it was directed to be paid at Bristol. In the 20th of the same knight the Commons ordered 8 ships, having each 150 men, to keep the sea continuously, of which number Bristol was directed to furnish 2; and 12 years after, when a fleet was ordered for the
protection of trade, London lent towards its fitting out £300, and Bristol £150.

At the time of Edward IV's succession to the crown, 1461, he came, in his progress through the western counties, to Bristol. William Canynges, the most celebrated merchant of his day, the (reputed) founder of the church of St. Mary Redcliff, and his mother's brother, was an important figure in the city, and was supported by William of Worcester, a contemporary authority, that he paid to the king 3000 marks for his peace, 'pro pace sua habenda.' This must be understood to refer to the whole fine levied on the Lancastrian party in the town, and which Canynges would have had, in his official character of escheator to the king, to pay into the exchequer. The king appears to have been well satisfied with the transfer of allegiance on the part of the burgesses, and with the ready service rendered on their part; for he immediately remitted the heavy fine levied on the city by Hen., re-granted the town to the burgesses for ever on payment of the same annual rental: this charter bears date 12th February, 1461, and it was accompanied, or nearly so, by a grant in fee of the customs for murage, koyage, and pottage, and by two charters confirming of privileges previously enjoyed. The fame of Canynges requires some further notice. It is recorded by William of Worcester that he employed for the space of 6 years 800 seamen, and every day 100 artificers. The same writer furnishes a list of his vessels, 10 in number, and including one of 500 tons burthen, one of 500, one of 400, and two of 220; and though some doubts have been entertained as to the then existence of a vessel so large as the largest here specified, yet when it is considered that it would not necessarily follow that it should have equalled the size of a modern vessel of the same registered burthen, there does not seem any legitimate reason for disturbing the text. The wealth of Canynges was certainly considerable: in his old age he became a priest in the college of Westbury, which he had founded. Resistance has been made above to Canynges as the reputed founder of Redcliff Church; but the honour has been claimed for Simon de Bourton, previously advertised to, for the grandfather of William Canynges, and for William himself. It is certain that a church previously existed on the site, and that it continued to exist as the chapel of the Holy Spirit contemporaneously with the present edifice for a considerable period: it is also certain that Simon de Bourton did found a church of St. Mary, Redcliff; and it is no less certain that to the wealth of the Canynges we are indebted for much of the beauty of the present structure. The difficulty may be got over by concluding, not with Mr. Dallaway, that three distinct churches of St. Mary, Redcliff, have from time to time existed on the same spot, but with Mr. Britton, that Canynges completed what De Bourton began. Mr. Britton has traced in the architecture of the church three distinct eras, which, with considerable ingenuity, he refers to the ages of the three individuals whose claims have been here alluded to. Of the general character of the edifice (one of the finest specimens of parochial church architecture in England), the view given in No. 165 of the 'Penny Magazine' will serve to convey a tolerable idea; and the sketch opposite of the North Porch, the grand though disused entrance, may furnish some conception of the labour bestowed in the architectural decorations. It is a splendid specimen of its kind, but unfortunately hidden from general observation by the near approach of the surrounding buildings.

In 1486 Henry VII. came to Bristol, and the burgesses, through the medium of a pageant of king Brennus, complained in the presence of the body of the town that the king was made to say that he had left the town in possession of 'riches and wealth manifold,' but that since that time 'Bristol had fallen into a decay,' from which there was no hope of recovery without some remedy at the hands of the burgesses, which was accordingly prayed for. Mr. Britton reports that 'after envoys the king sent for the mayre and sherif, and part of the best burgesses of the town, and demanded of them the cause of their poverty; and they showed his grace that it was by reason of the great loss of shipping in the whole.' The king heard them, and was accordingly prayed for. The king comforted them, that they should set on and make new ships, and exercise their merchandize, as they were wont to do; and his grace would so help them by divers means, like as he showed unto them; so that the mayre of the town told me they had not heard these hundred years from any king so good a comfort.' The follow-

From the temporary stagnation of trade Bristol was now recovering, and entered with spirit upon voyages of discovery under Sebastian Cabot, a native of the town, and the most experienced navigator of his age. The name of the vessel which first touched the shores of the vast continent of America was the Matthew of Bristol, and the earliest letters patent on record for the discovery and colonization of new lands were granted to three merchants of Bristol in conjunction with three Portuguese. The history of Bristol during the reign of Henry VIII. is principally a history of the Reformation within its walls. Among the suppressed religious houses of the greatest note were the monastery of St. Augustine, now the cathedral church, and the hospital of the Gaunts, now the mayor's chapel, originally founded by the Berkeleys after their intermarriage with the Gaunts, barons of Folkingham. Henry VIII. founded upon the ruins of the abbey lands a bishopric, thus first erecting the town into the dignity of a city and a bishop's see; it originally formed part of the diocese of Salisbury. The abbey he converted into a cathedral church,
erecting a dean and chapter therein. The Gaunts chapel and lands he sold to the corporation. Speed, in the list of suppressed religious houses, contained in his Chronicle of England, gave the value of this hospital, which was a charity for orphans, 1400l. The last reference to the monastery is when he states it was destroyed in 1567 by 15th. 3d.; and of Westbury College, which to Canegy was so large a benefactor, and wherein, as has been stated, he ended his days, 232 f. 14v. In the year following, 1568, the corporation set up a new chantry in one of the chapels of the castle. On the accession of Elizabeth she granted (1558) a charter confirming of antient privileges; and in 1561 the city was finally exempted from the charge of keeping the marches of Wales.

In 1567 the corporation granted that the Aid, a vessel of 200 tons came into Bristol, bringing with her an Esquimaux, his wife and child. The Aid had returned from an unsuccessful attempt to discover a North-West Passage: the name of her captain was Martin Frisibier. In 1581 the queen granted new chantries, confirming that of Henry VII, granted in the 15th of his reign, and increasing the number of aldermen to 12. When preparation was made to oppose the Spanish Armada, Bristol contributed 3 ships and 1 pinnace; London, 16 ships and 1 pinnace. A return of ships belonging to the United Kingdom in this year gives, of ships above 100 tons, to London, 62; Bristol, 9; above 80, London, 23; Bristol, 1; and under 80, London, 44; Bristol, 27: in which there appears either to be some mistake, or that the commerce of the kingdom had materially declined. The number of vessels during the reign of Elizabeth was at all the ports, London excepted, 77,000l, of which sum Bristol paid 5000l.

Six years after the accession of James I. (in 1609), Newfoundland was colonized from Bristol. In 1630, in connection with the island, 60,000l. Charles I. granted the whole of the lands, buildings, and hereditaments connected with the castle to the burgesses and commonalty of the town, to be held by them and their successors for ever in free socage at a rental of 4l. per annum. In 1631 the merchant adventurers of Bristol fitted out the Hemispheres, Maria, of 80 tons, under the command of Capt. James, who sailed from Kingskape on the 3rd of May in that year, purposing the discovery of a North-West Passage to China, to which enterprise the merchants of this country were then excited. The report of the immediate benefit accorded by the Spanish, the Portuguese, and the Dutch, in their traffic with the East. Capt. James's crew consisted of 20 men and 2 boys; he proceeded as far as lat. 56°, where, finding his course further impeded, and the winter setting in with alarming severity, he resolved to cast锚 himself; he had the good fortune to find a dient of sinking her in the bay named after himself, and wintered on shore. In July 2, 1632, the vessel was raised again, and the adventurous crew proceeded as far as lat. 65° 30', when, finding further perseverance useless, they shipped their cargo for England, and arrived in Bristol in October.

In 1634 the customs at Bristol produced annually about 10,000l.; for several years following the receipts exceeded 15,000l. From this time may be dated the commencement of that struggle between Charles and the people. It began in the demand for ship-money; and on Bristol was at once assessed the sum of 2163l. 13d. 4d.; in 1636 the assessments between Bristol and Liverpool were, according to Rushworth, thus distributed: Bristol, 1 ship of 100 tons, 40 men, and 1000l. charges; Liverpool, 2 ships of 200 tons, 200 men, and 1000l. charges. The struggle continued with increasing bitterness for the possession of the town, and the parliament were severe. Fiennes reports that the 'riches of Bristol since the stop of trade, and many malignant withdrawing their estates, is much otherwise than it was.' To this state of things Col. Fiennes, who held Bristol for the parliament, contributed his share. It was his custom to levy contributions on individuals by a written demand for the supply of the garrison; and during his ascendency some citizens were executed on charges of being estranged or deserters; and from which source he admitted the receipt of 3000l. During the royal occupation of the place, the weekly cost of its garrison, and of Bath, Berkeley, and some others, amounted to about 2000l., which was assessed upon the neighbouring townships, and laid on them, 3000l.; the proportion borne by the hundreds of Redcliffe and Bedminster was 200l. per month. Under the parliament the sum of 300l. per month was ordered to be raised for the defence of the city and its castle; of which sum Bristol paid 200l., and the surrounding counties of Gloucester, Somerset, and Wilt the remainder.

In the year 1636 the castle was demolished by order of parliament, their last and best act with regard to Bristol under the control of its corporation.

Three years after the Restoration, Charles II. visited Bristol; and in the following year (1664) the burgesses obtained from him a charter of confirmation, with a clause that the members of the corporation should take the oaths of supremacy and allegiance, and that the mayor, aldermen, and corporation should serve the king as a loyal court of admiralty. On the 18th May, 1665, the corporation, acting under the advice of its councillors, made a requisition on all the freemen and corporation of the town, for a common order of 1000 men, to render the privileges of the city into the king's hands. Upon this surrender, which was never enrolled, the king granted a charter confirming of all old privileges, but vesting the town near the castle in the existing executive branches of the corporation, and an act for a waiting from the branch the power of electing its successors. The king however retained in his own hands the power of removing any member by an order in council; and the corporation paid him 5000l.

In 1667 King James chose to exercise the power reserved by charter of Charles II., and removed by writ twenty-eight of the corporate body, supplying their places with others; but on the issuing of the proclamation for the resumption of charters, October, 1668, the corporation returned to their old number of 12 aldermen and 40 commonalty.

By an act obtained 11 and 12 William III. the corporation, for the better preservation of the river, extended their jurisdiction four miles along the course of the Avon inward above Bristol bridge, to the village of Hannam in Gloucestershire; and the same body obtained a charter from Queen Anne, which, confirming all previous privileges, removed, with every other right of the crown in fines, fees, &c., the power of deposing any member of the corporation by writ of privy council. The reason of seeking this charter appears to have been some question as to the legality of that of Charles, founded in some degree upon doubts respecting the legality of the surrender upon which it was granted.

The following facts will serve to illustrate the condition of the city in the eighteenth century. In 1725 the number of houses in the city was 6701; in 1738 they had increased to 8701, of which, as appears from the returns of land tax then laid before parliament, 3947 paid severally a rental exceeding 5l. per annum; the population at this last period was 52,000. In 1732 appeared in the press for the first time, a 'Journal of the British Post-office,' a German writer on the political and commercial geography of Europe, estimated the number of houses in the city and suburbs at 13,000, and the population of the whole district at 95,000. This estimate is in a note, added, apparently, by the author himself; but possibility however is that this exceeded the fact. The manufactories of brass was commenced in 1704; that of zinc in 1743. In 1745 the receipt for one year of wharfage, a local tax on foreign imports and exports, was 918l.; thirty years afterwards it was 2000l. From 1750 to 1757 the average net receipts of the customs at Bristol was 155,189l.; at Liverpool 51,136l.; the net receipt at Bristol in 1764 was 195,000l.; the number of vessels reported inwards 2533. In 1784 the customs at Bristol yielded 445,000l. The tonnage duties, in 1765 the tonnage belonging to the port of Liverpool amounted to 49,341 tons, comprised in 465 vessels; the number of vessels belonging to the port of Bristol was 360, with a burthen of 55,908 tons. In the same year the entire trade of Bristol stood thus: Foreign trade—British vessels in 255, tonnage 38,585; out vessels 243, tonnage 37,542: foreign bottoms in 69, tonnage 11,112; out 66, tonnage 37,542. Coasting trade—in vessels 1865, tonnage 65,290; out vessels 1832, tonnage 62,199; Irish vessels—in 161, tonnage 9690; out vessels 502, tonnage 5855. From this time Bristol may date her loss of claim to be considered the second commercial place in the kingdom, and the superior importance of Liverpool began to be felt.

The only remaining facts necessary to be mentioned in the historical part are the bridge riots of 1793, and the still more memorable riots of 1831. As to the former, it is unnecessary here to do more than to allude to them; of the latter some account will be given from personal observation.
The Bristol riots of 1831 originated in some disturbances which attended the visit of the recorder, Sir Charles Welby, to the city on the 29th of April, 1831. These disturbances were at first nothing more than the expression of the popular dislike to the recorder, whose opinions on the question of reform, as stated by him in the House of Commons, were at variance with those of a large body of the population. In conjunction with the persons thus excited, the magistrates took measures to prevent the recurrence of the same scenes at the recorder's visit, Saturday, October 29, 1831. The popular feeling was still more excited, and broke out in open violence. The military were called in, a skirmish took place, and a man was shot by a soldier. This agitated the populace still more, and it was judged prudent that the obstreperous regiment (the 14th) should be marched out of the town on the following morning. At this crisis, when the mob had forced its way to the collars of the Mansion-house, the magistrates, in order to prevent any expression of political feeling, were assuming the character of mere rioting and plunder, the indecency of the corporate authorities completed the scene of confusion. Several citizens who had attended at the Guildhall on the invitation of the magistrates to assist them in repressing the disturbances were told to go home to dinner, to give the magistrates time to consult over several private letters of advice. A second meeting took place in the afternoon, but in the mean time both gaols had been forced and fired. Operations on a large scale were then commenced; some persons were pursuing the rioters, because the magistrates would not sanction the use of arms. At this time the rioters were still in possession of the larger gaol, and employed in feeding the flames in the governor's house and debaters' rooms with the household linen. However, the fire was extinguished when the magistrates to the scene of disturbance being unarmed, fled at the first charge. Speaking from knowledge acquired on the spot, it is not too much to say that at any time during this day, subsequent to the retreat of the troops, it was all folly to hope that the mob might have successfully put down the disturbance; the half-dozen dragoons within the town were quite equal to the defence of the large prison, had measures been taken to garrison it in time; and upon revision of the whole transaction it appears not probable that, even if the mob had been on the much smaller scale and of much less number, had they been engaged in the work of destruction, which seems almost contemptible. From the city prison the mob proceeded to the Gloucester county prison, where, as in the city, the prisoners were all liberated and the goul fired. In the evening of the same day (Sunday) the Mansion-house was plundered and burned down; from the Mansion-house the destruction was extended to the private dwellings adjoining, and to the Bishop's Palace in another part of the town; and during the night fifty buildings throughout these parts were burnt. By means of fire, the Bishop's Palace, and forty-five private houses were consumed, and the property either destroyed or carried away. The total loss was estimated, and perhaps not over-estimated, at 200,000l. In the morning of Monday the first check was given to the rioters about six o'clock, by the spirited defence of a private house, then attacked, by its owner and a few friends; and a charge simultaneously made by the few dragoons, upon the enfeebled remnants of the mob, overpowered with their previous excesses, effectually quieted the disturbance. The property consumed in these buildings, which were entirely free from rioters, and the passengers within them were confined to a few persons anxious to ascertain the fate of their friends residing within the neighbourhood of the fires, and a few women and children to whose welfare they were devoted. This check, happily the definite order was now given, for the first time, by the magistrates, of course in ignorance of the then state of the city, to charge through the streets, and given to troops just recalled to the place, or who had not till then been informed of the actual nature of the riot. The charge itself was unavailing for and unexpected. Active search was also made after the stolen property, much of which was recovered, and many captures were made of persons who were plainly implicated in the riots. The list of killed and wounded, as subsequently made out, was, killed 12, wounded 96; but this list included only those who were taken to the public hospitals; many rioters perished in the streets, and many more were seen or heard of being overtaken while engaged in plundering or drinking.

At the special commission, opened on the 2nd of January, 1832, in the Guildhall at Bristol, before the Lord Chief Justice Tyndal, and Mr. Justices Taunton and Bosanquet. Three persons were convicted for inciting to murder, and, in these disturbances, the bills against 12 of whom were ignored; 21 were acquitted, and 81 convicted: of the prisoners convicted, 5 were condemned to death, 4 of whom were executed, 1 having been reprieved on the ground of defective intelligence; and 26 the verdict of death was recorded; 1 was transported for 14 years, 6 for 7 years; and 23 were sentenced to various terms of imprisonment. Courts-martial were at the same time held on Colonel Breton, the military commander of the district, and upon the second in this charge. The sentences of the military court-martial were brought suddenly to a close by the melancholy suicide of Colonel Breton; the second terminated in the object of it being cashiered, with liberty to sell his commission. Ex officio informations were also subsequently filed against several of the magistrates for neglect of duty, and that against the mayor, Mr. Pinney, came to trial before the Court of King's Bench. The defence was, that the citizens refused to confide in or assist the magistrates, and that consequently, deserted as they were by the public, they could not do their duty. But the magistrates admitted that the verdict of acquittal appears to have been given; and the other informations were withdrawn. Subsequent to the riots the corporation introduced a bill into parliament for providing compensation for the sufferers; but this measure was taken from the very act of the rioters, for the purpose of the rate-payers, under whose care the bill was materially amended and ultimately carried. This measure provided for the awarding of damages by commissioners to be elected by the rate-payers. Of 102 claims taken before the court, 21 have been dismissed, and the only one carried into court; thus furnishing an admirable illustration of the sufficiency of the principle of arbitration and mutual agreement, which in this case has reduced the amount chargeable on the city in respect of the fires to 16,685l. The city in all has been suffered to take the common expenses course, would have been doubled. The amount annually levied is 16,000l.

Present State of Bristol. Local Government. — The corporation of Bristol, prior to s and f of William TV., was styled the 'mayor, burgesses, and commonalty of the city of Bristol,' and consisted of a common council of forty-three persons; this body was composed of a mayor, two sheriffs, twelve aldermen, the recorder (necessarily a barrister of five years' standing) being one, and twenty-eight common councillors. But the corporation has been in the hands of the direct or indirect appointment of nearly four hundred (perhaps) officers, with their salaries and fees attached, making average incomes of from 50l. to 1500l. per annum, and of the presentation to fourteen adowons, and to two lectureships. The public property in its entire control netted from 16,000l. to 18,000l. yearly; but this, under the system of leasing on lives, is considerably less than the improbable value: its debt, which in 1825 amounted to 51400l. only, had in 1833, when the commissioners of corporate inquiry visited the city, increased to nearly 55000l. But the city has not yet got money on condition of paying certain dividends, amounting to about 31000l., making its total liabilities at that time 86000l. This total, up to the extinction of the old body, December, 1835, had increased by excess of expenditure to a round sum of 112000l. The value of the corporate property is estimated at 850000l.

The jurisdiction of the corporation extended by water over the whole of the old and new course of the Avon, inland into Gloucestershire about four m. beyond the limits of the corporation, and, in addition, just below a high-water mark on the Severn, from Auster Passage to Cleavers, including the islands of the Denny, and of the Flat and Steep Holmes in the channel; by land it included eighteen parishes, each governed by a self-elected vestry, and the precincts of the city to the parishes of Clifton, Bedminster, and St. Philip and St. Agnes contiguous to the dock company's works, the whole containing a population of about 65000 souls. The remainder of the out-parishes were under the jurisdiction of their several counties of Somerset and Gloucester, and contain, in the
immediate suburbs of the city, a population of about 40,000, comprised within five parishes, and principally consisting of the poorer classes.

The governing body of the corporation, commencing with the 1st of January, in the present year (1836), consists of 48 councillors, annually elected by the rated inhabitants, and of 16 aldermen, and a mayor: the city is divided into 10 wards. The jurisdiction is extended over the whole of the suburbs, including parliamentary boroughs, which embraces the whole of the out-parishes, except some inconsiderable parts of Bedminster and Westonbury, more closely connected with the county than with the city.

The government of the poor of the in-parishes is vested in a corporation, under 3rd of Geo. IV. cap. 200, but first created by 7 and 8 of William III. cap. 32, consisting of 13 members of the municipal body (late the mayor and aldermen), the 18 senior churchwardens of the 18 parishes, the Overseer of the ancient of the castle, and 48 persons elected by the rate payers of the old city wards, 4 to each. The corporation possesses two workhouses, one within the city, and the other, purchased for the use of the poor in 1698, and principally used for the meetings of the corporation, and as an infirmary; the other, properly the workhouse, a large building on the Gloucester road, purchased in 1831 of the government, by whom it had previously been used as a military depot, and subsequently made part of the city of Bristol by act of parliament. The money relief given by the corporation exceeds 17,000l. per annum; the increase of pauperism in Bristol is, upon an average, over two periods of five years, each ending with the years specified.

The increase of pauperism at Bristol is disproportionately large, compared with that of England and Wales, and also as compared with the relative population of the increase:—

To the average of 31,000l. given above must be added an average of 4000l. of uncollected poor rates annually reassessed in addition under the last act of incorporation (and separately assessed by the justices, although subsequently assented to and collected with the rate) upon the entire 19 parishes and precinct.

The out-parishes of Clifton, St. Philip and Jacob, and the district of St. James and Paul, the poor are governed by local acts; in those of Bedminster and Westonbury they are regulated under the general law. Since, however, the parliamentary borough cannot contain less than 110,000 souls; nor can the rack rental be much under 425,000l. of which 200,000l. may be taken to be shared by the out-parishes. The pauperism of Bristol is doubtless in part owing to the decline of its trade and manufactures; but the whole district within the boundary has suffered materially from a vicious system of management, and from laxity in collecting the rates generally. By the practice of excusing the occupiers of small houses from all payment on the ground of poverty, this exemption is also given to speculative builders and small capitalists, in a neighbourhood where building materials are cheap and there is much poor waste ground, to multiply the erection of small houses.

The district of St. James and St. Paul has escaped this evil by means of a local act, under which the landlord is rated, and which has been found to be a sufficient check. The local taxation annually assessed within the 19 city parishes and precinct, including church rates estimated at 2000l., poor's rate at 31,000l., compensation rate 10,000l., harbour rate at 9000l., and the rates on houses at 10,000l., and reassessments of the whole at 4000l., is 65,000l. This total has not averaged less than 65,000l. for many years.

The constituency of Bristol, returns two members to parliament, and being continued to do so from a.d. 1263. Prior to the passing of the Reform Act the electoral right was in the freeholders and freemen resident and non-resident, in all 8600, the proportion of freeholders to freemen being 1 in 7, and of non-resident to resident voters, 1 in 4. The free-men acquired the right either by birth within the walls, the father having been previously enrolled, by marriage with the daughter or widow of a free-man, by servitude to a free-man within the walls, or by purchase; the price of enrolment in the three first cases was about 3l.; in the last the presumed value of the exemption from town dues, conferred, by admission, regulated the demand; and 300l. has been paid. The average admissions of ordinary years were 50; in the years of contested elections they averaged from 600 to 2000, and have sometimes of themselves decided an election, giving a clear majority to the candidate by whom or by whose friends the fees were paid. Contested elections under the Reform Act times involved an expenditure of from 20,000l. to 30,000l. The Reform Act extended the freeholders' privilege to the out-parishes, removed the abuse of non-residence and of admission to the freedom for election purposes after taste of the writ, and introduced the 10l. constituency. The following is the relative proportions of each subsequent registration and polling—

For municipal purposes Bristol, as already observed, is now divided into 10 wards. The number of rated properties within the boundary is 19,397, of which 10,498 are within the old city bounds; but the municipal constituency does not at present exceed 4000.

The foreign trade of Bristol principally consists, in imports, of sugar, rum, wine, brandy, colonial and Baltic timber, tallow, and other forest produce, and in exports, of coal, and, when the ports are open, wheat, and, within the year 1833, tea. In 1833 the import of foreign corn was 147,076 quarters; in 1832, the last, 6304 quarters. In 1834 the customs revenue for the three quarters ending Michaelmas was 762,221l.; for the three corresponding quarters of 1835 it was 889,776l.; the increase of 127,557l. is attributable to the new traffic opened with China. The average import of sugar is about 30,000 hogsheads; of tallow, 6799 casks; of wine, 1615 pipes; of rum, 2533 puncheons; of brandy, 115,932 gallons; and in the trade about 15,000 tons of shipping are engaged. The principal articles of export are iron, tin, bronzes, refined sugar, glass bottles, Irish linen, and manufactured goods. The annexed table will show the comparative state of the direct foreign trade of Bristol for the last 5 years, ending January 5, 1835, on the average of the 5 first and the 3 last years ending with the 5th of January of the given dates—

Bristol derives a considerable portion of her supply of foreign produce coastwise under bond principally from London and Liverpool, but also from the minor ports of Gloucester, Newport, Bridgewater, Exeter, Barnstaple and Bideford. In the quarter ending January 5, 1835, a fair average period, Bridgewater furnished to Bristol 225 casks of foreign tallow, about 13 per cent. of the average import; and during the same period 2000 tons of foreign goods were sent round from London and Liverpool. The decline of the foreign trade of Bristol both in imports and exports, with the increased cost of coastwise trade, is attributed to the excess of local taxation in the shape of municipal and other imposts levied upon shipping and goods, and levied almost wholly upon the foreign trade; so that, independent of the direct effect of the tax itself, it has operated by the prohibitory scale of duties which prevails, there is a premium held out for supplying the existing demand coastwise, the difference on the tax being more than sufficient to cover the extra cost of transhipments. The
amounts collected average 42,000l. per annum, but the pressure is to be estimated rather by what is not received than by that which is. Public attention has been very forcibly directed to this subject within the last 10 years, and considerable though inadequate reductions have been made with a corresponding good effect. The coasting trade of Bristol is very considerable, particularly with Ireland. The imports principally consist of iron, tin, coal, salt, and Irish linens and agricultural produce; the exports, of articles of foreign and colonial produce, particularly groceries, tea, wines, and spirits, and of the manufactures of the place. The total coasting tonnage engaged, on the three years average ending January 5, 1835, is—

Bristol, upon the same average, takes from Ireland among other articles, 1193 tons of butter, 97,566 quarters of grain, 1996 tons of flour, 1114 tons of potatoes, 3507 sheep, 3115 head of cattle, 109,263 pigs; and Ireland takes in exchange from Bristol, 2406 tons of wrought iron, 1325 cwt. of leather, 5790 cwt. of raw sugar, 36,840 cwt. of refined sugars, 59,056 lbs. of tea, and 3569 boxes of tin plates. The coasting trade of Bristol has considerably increased within the last 10 years, the steamers, put on in 1826 being very nearly in addition to the previous traffic. The advocates of reduction of local taxation ground their strongest argument on the fact that the waste has been so frequent and so consequent on the entire removal of town dues in 1824 from the coasting and Irish trades, without which the profit by steam could scarcely have had existence: the effect of this on the Irish trade may be estimated from the following figures—

The existing manufactures of Bristol are glass bottles, crown and flute glass, brass wire, pins, sheet lead, spelter, chain cables, anchors, machinery, drugs, colours, dyes, painted floor-cloth, earthenware, refined sugar, starch, soap, British spirits, tin, copper, and brass wares, bricks, beer, porter, pipes, tobacco, and hats. Most of these are either carried on within the city or in its immediate neighbourhood; but the manufacturing circuit may be considered to extend six miles around, and the principal factories are those for glass, sugar, iron, brass, floor-cloth, and earthenware. The ability of the workers in glass and sugar refining has been long known; but manufactured industry in Bristol is far from being in a flourishing state, and several branches have withdrawn from the place. This, in a neighbourhood which, in addition to a ready port, furnishes a cheap and inexhaustible supply of building materials, water, coal, and provisions, was greatly facilitated, since internal conveyance, is mainly to be attributed to that long, prejudicial, and impolitic excess of local taxation which even now compels the manufacturer to send his goods round to Liverpool for exportation, in some cases to save the difference on the tax, in others because the port does not supply the necessary tonnage for direct shipment.

**Public Buildings, Institutions, and Companies**—There are in Bristol 23 churches connected with the establishment and 36 dissenting places of worship. The churches of Bristol present some beautiful specimens of ancient English ecclesiastical architecture, the finest being the tower of St. Stephen's, celebrated for the decorated elegance of its summit; the church of St. Mary, Redcliff, of which a characteristic specimen has been already given; and the cathedral church, antiently part of the abbey of St. Augustine, the Norman gateway of which presents one of the finest existing specimens of its style in England. The proportions of the arch are in the original somewhat destroyed by the rising of the ground, and the effect is otherwise weakened by the introduction of modern arches; in the annexed sketch the antient window is restored. Forty religious societies connected with the establishment and the various dissenting bodies of Bristol collect annually in favour of the peculiar views of their members about 10,000l.; this is exclusive of schools, maintenance of places of worship, and chance collections after the Sunday services for other specific objects.

The council house is in the centre of the town, partly in Corn Street, partly in Broad Street. It was erected in 1827 at an expense of 14,000l., and is a very plain but convenient building executed by Sir R. Smirke, and surmounted with a statue of Justice by Baily, a native of the city; it communicates with the justice-room, a smaller building annexed. The courts are held in the Guildhall in Broad Street, an antient building. The Mansion House, burnt down in 1831, has not been rebuilt. The gaol was on the site of W., of the city, upon the new course of the river Avon, in 1816, at a cost of 60,000l., under the powers of an act of parliament then obtained. It is a singular fact that the mortality is greater in the new gaol than it was in the old prison: this is probably attributable to the greater degree of cold which must prevail in the present than in the former locality. The bridewell, entirely destroyed during the riots, has been rebuilt upon its old site in an enlarged and more convenient form. The principal bridge is that connecting the centre of the town with the Redcliff side of the Avon; it is built of stone, and has 3 arches, the centre one being elliptical with a span of 55 ft., the side arches semicircular, each 40 ft. in span. A swivel bridge of iron, opened in 1827, in the place of the Newbridge, crosses the harbour, connecting the parishes of Clifton and St. Augustine with the city; and two iron bridges, each with one arch spanning 100 ft., cross the new course of the Avon, severally connecting the city with the Bath and Wells and Exeter roads.

The docks at Bristol were commenced in 1804, under the powers of an act of parliament obtained 43 of Geo. III., by a proprietary body, and were first opened in 1809. They were formed by digging a new course for the Avon south of the city, and by converting the whole of the old channel, from an overflow dam erected above the Bristol bridge in St. Philip's Marsh to the entrance lock at Rowkham, including the branch of the Frome within the quays of St. Augustine and St. Stephen, into one floating harbour, about three m. in length. The quays thus inclose one end of the city, extending from Bristol bridge to the small stone bridge across the Frome, where that riv. ceases to be navigable, and
thus form three sides of a parallelogram, the eastern and southern being washed by the Avon, the western by the Frome. The total extent of quay is 2000 years; but these limits admit of any extension along the banks of the harbour below the town which the increase of trade could require. A situation for the temporary accommodation of vessels entering or leaving the harbour—such as at Rowanham, principally used by large vessels, and containing in length between the locks 275 yards, in extreme width 147 yards: it rounds smaller towards the mouth, and empties itself through two locks of 2400 tons. The second basin lies south of the quay, communicating with the Avon branch of the harbour, above its junction with the Frome, and emptying itself into the riv. Avon through a single lock, about 300 yards below the iron bridge at Bedminster; it is 540 yards long, and averages 60 yards of width. Previous to the construction of this harbour, vessels were suffered to take the ground, and considerable injury and delay were occasioned; important facilities were consequently afforded to the trade of the port by these works.

The estimated expense of the docks was 300,000/; their actual cost exceeded 600,000/., which sum was made up, under the powers of four acts of parliament obtained subsequent to the constitutionary act, by forced calls upon the subscribers. The rates are 1/10th of gns. per ton, or 50/- at 1471 per each, and by loans. The present capital of the company is 594,054/., of which 268,232/ is debt, bearing interest at five per cent.; the remainder of the capital is comprised in 2099 shares, on which the maximum dividend allowed is not more than 4 per cent. of the capital, and the dividend may be taken for a long time wholly unproductive, and the dividend when made seldom exceeds 2 per cent. The income of the company averages about 31,000/., of which 20,000/ is derived from a tonnage on vessels, 7000/ from the rates on foreign goods, 2500/ from tolls, and 1100/ from shares. The rates in the city parishes, and the remainder from lockages, canal rates, boat licences, and other inconsiderable sources of income. The cost of maintenance averages about 7000/.

The dock rates on vessels and goods far exceed the corresponding rates in the second city of London, and the eastern docks of the great West of England and South Wales, by the clothiers of the counties of Gloucester, Somerset, and Wilts, and by the leather-factors of the kingdom. The sales of leather are mostly very extensive. The commercial rooms in Clare market are crowded, and those in the city of London, under the powers of an act of parliament by a proprietary body of shareholders. The chamber of commerce, instituted in 1823, for the purpose of protecting and promoting the commercial, trading, and manufacturing interests of Bristol, is supported by subscribers. The tolls from coal, and other goods, have been estimated at 250,000/ per annum.

The great market is held on the Thursday preceding Christmas Day, when the trade is generally very fine. Extra markets are also held at the two fairs, the first of which is kept in March in Avon Street, in the parish of Temple; the second in September, in an open square on the Avon, near the entrance into the Avon Bridge, in that of Saint James's; and the third in July, in the parish of Temple. The market is of a threatening aspect, and traditionally the burialplace of those who had died of the plague. Of these fairs the most considerable is the last; both commence on the 1st of the several months, and continue about eight days; they are supported by a contribution from the three fairs in the city.

The navigation of the river is opened every Thursday; and the supply fluctuates considerably, but the average is about—cattle 500, sheep 5000, pigs 400, horses 80. The tolls produce about 5000/ per annum.

The great market is held on the Thursday preceding Christmas Day, when the trade is generally very fine. Extra markets are also held at the two fairs, the first of which is kept in March in Avon Street, in the parish of Temple; the second in September, in an open square on the Avon, near the entrance into the Avon Bridge, in that of Saint James's; and the third in July, in the parish of Temple. The market is of a threatening aspect, and traditionally the burialplace of those who had died of the plague. Of these fairs the most considerable is the last; both commence on the 1st of the several months, and continue about eight days; they are supported by a contribution from the three fairs in the city.
The Bristol Institution, a handsome building erected in Park Street, by shares of 5½ each, is supported by annual subscriptions of two guineas. It was first opened in 1823. It has a reading-room, a small library, and a museum. The museum contains a very fine collection of antient and modern productions of art. Among the objects are a statue of Eve, a fountain, and a complete set of casts from the Aegina marbles. It possesses a very fine cabinet of British and foreign insects, Müller's collection of crinital remains, the originals upon which his great work on the natural history of the British Crinoids is founded; and of minerals, there are several thousand specimens, arranged according to W. Phillips; in conchology above 2500 species; mammals and birds above 1600. The collections of reptiles, in spirits, of mineral conchology, and of zoophytes, are exceedingly numerous. The catalogues of all classes of objects are now in preparation to be issued. The theatre of the institution, where also papers on literary and philosophical subjects are occasionally read by the members of a society associated for the purpose and annexed to the institution. In the large room of the Museum, exhibitions of pictures annually take place, under the superintendence of Mr. Boddam, as of a local society of artists, associated for the purposes of mutual improvement in sculpture and painting. The Bristol Mechanics' Institution was founded in 1823; it now meets in a building erected for the purpose, in Broadmead, and open to the public daily. The Bristol library, in King Street, founded in 1772 by 24 private gentlemen, has now 300 subscribers, each of whom pays an annual subscription of one guinea and a half, and holds a ticket entitling him to at least 100 volumes. At present, about 18,000 volumes, of which 2000 belong to the city, having been left with a building, in which they were contained, for the use of the aldermen and shopkeepers of the town. But the corporation have granted both the books and the building to the subscribers, and have enjoined them, as the due admixture of scientific with classical studies, the latter of which are not entered upon before the age of ten, and by the methods employed to cultivate the moral and social qualities of the students as well as their intellectual powers, to acquire the most gratifying results. Discipline is maintained without recourse being had in any instance to corporal punishment. The Bristol Medical School, established on its present efficient scale in 1834, is held in high estimation by the Bristol college, and furnishes a complete course of lectures to the pupils in anatomy, medicine, and chemistry, ranks very high, and the certificates of its professors are recognized at Apothecaries' Hall. There are about 36 charity schools open daily in Bristol; and the number of Sunday schools is considerably larger. Twelve of the 30 day schools are endowed; in the whole are educated about 2000 children, and in the Sunday schools not less than 10,000. The income of the endowed schools is nearly 700£., for which are wholly maintained, educated, and apprenticed 168 boys and 40 girls; educated and clothed, 90 boys and 88 girls; and educated wholly, 148 boys. The income of all other schools, including that of two societies for educating young men to the ministry in the church establishment and in the Baptist connection, is estimated at about 300£. The endowed schools the principal is the Free Grammar School, instituted for the purpose of educating freely all who may resort thither in "good literature." The school has two fellowships at St. John's College, Oxford, and five exhibitions at the same university, and is otherwise very well endowed, but under the trusteeship of the late corporation it has ceased to have a scholar. Among the charitable institutions of Bristol the Infirmary, founded in 1753, stands pre-eminent. It is a large building accommodating 40 patients, the average number of whom admitted in the year is 1600; per annum, of which 200. There is a weekly visiting of all patients on the premises, the object being to restore that desirable feeling of independence among the poor which has certainly suffered in Bristol under the influence of its many local charities. The Dispensary, another establishment, which has 2 stations at separate ends of the town, visiting all the sick in the houses, and giving medicine, on the average, about 2700, including about 500 midwifery cases. Its income, arising from subscriptions, averages 100£. per annum. Among other minor institutions of a similar character are two for the cure of diseases of the eyes. The one in Maudslay Lane, and the other in Woodberry Down, has an asylum and basket factory annexed, that in Frogmore Street exists entirely on voluntary contributions, and treats 1300 patients annually, boarding some of them, at an expense of 70£. only. There are besides about 40 voluntary charities in the city, besides the Hospital for the aged poor among the poor, in food, clothing, medicine, and in other forms, about 15,000£. The endowed charities are estimated at 23,000£., of which 6000£. disburse some of the amount left for the purposes of being lent out in various sums and for various terms, for interest, and 9000£. is distributed annually among the poor; the remainder is appropriated to the maintenance of schools and other endowments. This statement does not include charitable collections, which sometimes extend from 600£. to 6000£. Bristol supplies the newspapers, three of which are printed on the Saturday and one on the Thursday in each week. A quarterly journal, devoted to science and literature, is also printed at Bristol, of which four numbers have appeared. The rocks of the immediate neighbourhood of Bristol are composed of carbonaceous lime-stone with the newer red sand-stone formation with the dolomitic conglomerate in the last formation there have recently been discovered some saurian remains, which form three new species. The ranges of mountain limestone at St. Vincent's Rocks are remarkably fine; coal-fields extend N. and S. of the city about 28 m., but the beds are comparatively thin, as compared with those of the other coal districts of England. The rocks at Clifton supply a saline spring; the water of the Clifton spring is from the dump 74° Fahrenheit, and it then everolees carbonic acid gas, but the spring has been used in consumptive cases. Its composition is thus given by Dr. Carrick—Specific gravity 1.0077. In each pint—carbonic acid, 3°5 cub. in., carbonate of lime, 1°5 gr.; sulphate of soda, 1°5 gr.; of magnesia, 1°; total, 6°. The Hotwell House is beautifully situated beneath the rocks, looking on the river, along the banks of which a fine new carriage road leads from the well round the rocks to Clifton Down; but a reader on the lower slopes of the Sketty Hills, which is a fashionable retreat,—the west end of the town—is approached by an easy serpentine path, leading up the rocks from behind the Hotwell House. The scenery around Bristol, particularly the Clifton Hotwells, is exquisitely beautiful. The Bristol Botanic Gardens are considerably more highly interesting. In a catalogue recently compiled by Mr. G. H. Stephens and printed in the West of England Journal, 375 specimens are enumerated as part of those found in the immediate neighbourhood. Many of these are
of extreme rarity, and of some the habitats described are the only ones known in the country. The richest fields for the botanists are the downs, the rocks, and the woods of Lothian on the Haddington shore. The phleumone of the pines having recently attracted considerable attention, a self-regis-
terising tide gauge, contrived by Mr. Shirreff, the sub-curator of the Bristol institution, was, upon the suggestion of Pro-
fessor Hewlett, erected at Kingsroad, about halfway be-
tween the mouth of the Avon and the mouth of the Severn. The several heights of water has been since regularly kept.
A series of observations has also been simultaneously made at the entrance to the Bristol docks; and the result has been already so far satisfactory as to induce the publication of an average of tide tables for the port, calculated by Mr. Bunt of Bristol, in which the errors of preceding cal-
culations, to the amount of more than 30 minutes, have been reduced to 1 in 25. The greatest difference of the height of the tide at springs and neaps, observed on the gauge at the Bristol Channel, between 1835, was between the 17th September and the 14th of May. On the former date the water rose to 48 ft. 10 in.; on the latter to 23 ft. 4 in. The difference between the height of the neap and spring tides, at the dock gates, is from 4 to 5 ft. less than at the gauge, although the intervening distance is but four miles—a fact very clearly shows that the supposition of the wave manner in which the same level is clearly erroneous. The temperatures, pre-
vailing winds, &c., are shown in the annexed tables for the last six years:

No register of the rain was kept prior to 1831; and the month of March in that year is omitted in consequence of the pluviometer being out of order. The meteorological tables and figures are all taken from the observations of Mr. Jones.

BRISTOL, a county in the state of Rhode Island in the U.S. of America, containing the three townships of Bristol, Warren, and Barrington. Bristol c.o. occupies the E. por-
tion of the state and joins the c.o. of the same name in Massachusetts. The pop. in 1810 amounted to 5072; in 1820 to 5637; and in 1830 to 6466.

BRISTOL, a port and the principal town of the above c.o., is situated on a pen. called Bristol Neck, at the bottom of Narraganset Bay, and occupies the W. side of the pen. in 41° 40' N.lat. and 71° 12' W.long. It is a pleasant, well-
built town; the harbor is safe and commodious, and the place has considerable trade. Ships arriving to the port, at 31st December, 1831, to 9366 tons; the ex-
ports consist of agricultural produce drawn from the neigh-
bours, country, the soil of which is very fertile. The town contained in 1830 a pop. of 3052; it has 5 incorporated banks, the aggregate capital of which is near the 500,000 dollars. The general assembly of the state of Rhode Island holds its sittings in the month of January every year, either at Bristol, East Greenwich, or Providence.

Bristol is 15 m. S.S.E. from Providence, the capital of the state, and 30 m. S.W. of Boston.

BRISTOL CHANNEL. [Stern.] BRISTOL, a port, derived from the French and ap-
pplied, in permanent fortification, to a fortification or bar or parapet which deviates from the general direction. Thus, in a front of fortification with retired flanks, the part of the curtain immediately contiguous to each flank, which is traced to the line of the flank, is called the Bristol, or the part of the curtain. An example of this kind of brisboy is shown at at (fig. 1) in the article Bastion. In field fortification the faces of a star fort and of any indented line of parapet are called brisboys.

BRITAIN, GREAT. [Great Britain.] BRITAIN, NEW. [New Britain.]

BRITANNIA, the name by which the Island of Great Britain is mentioned by the Latin writers. We propose in the present article to give a brief notice of its ancient in-
habitants and history, previous to and during the period of the Roman domination.

The earliest inhabitants of Britain, so far as we know, were probably of that great family the main branches of which, distinguished by the designation of Celts, spread themselves so widely over middle and western Europe. The Welsh and Danish traditions indicate a migration from Jutland; and the name of Cymry, given to the immigrant people, has been supposed to indicate their probable identity with the Cimmerians (the Kyphusos of Herodotus, and the Cimbrin of the Roman) who, according to the statements of Thucydides (from their more ancient seats N. of the Euxine, traveled to Europe in a N.W. direction, and found new settlements near the Baltic and the mouth of the Elbe. These barbarians then reached Britain by the same route which was afterwards traversed by the Saxons and Angles. The Celts crossed over from the neighbouring country of Gaul, and Welsh traditions speak of two colonies, one from the country since known as Gascony, and another from Armorica. At a later period the Belgae, actuated by martial restlessness or the love of peaceful colonies, sailed the S. of England, and settled there, driving the Celts into the inland country. These Belgae were a branch of the great Teutonic family.

Before the arrival of Julius Caesar in Britain the isl. was but imperfectly known to the more civilized nations of the antient world. The people of Carthage and Massalia (called Masalia by the Greeks) or Marseilles, traded for tin with certain isls. called by Herodotus Κατσαρίνιδας (Cassiterides), 'the Tin Islands,' which are supposed by some to have been the British Isles, or, at least, Cornwall and the Scilly Isles.

The etymology of the word Britain has been much dis-
puted. One of the most plausible is that which derives it from a Celtic word brith, or brit, 'painted' (Caden); in which name it is supposed there is a reference to the custom of painting their ships and clothing their garments extracted from woad. Carter says, that the name in the most antient British poets is Inis (island) prydhain. Whether this form or that of the Roman writers furnishes the best clue to the original form of the native designation is perhaps questionable. The meaning of britain, if it be anything more than a corrupt form derived from the root briti, does not seem to be known. It would be to little purpose to give other etymologies, or to enter further into a matter in which certainty is so little attainable.

Caesar is the first name by whom any authentic partic-
ulars respecting the isl. are given. Stimulated probably by the desire of military renown, and of the glory of first carrying the Roman arms into Britain, provoked also, as he tells us, by the aid which had been furnished to his enemies in Gaul, especially to the Veneti (the people of Yannæ in Bretagne), and other maritime people of western Gaul, he determined upon the invasion of the island. As a preliminary step, he summoned to his camp a number of the merchants who traded to the isl. (who alone of the Gauls had any ac-
cquaintance with them) and questioned them minutely. Their caution, however, or their ignorance, prevented his learning much from them. Failing in this quarter, one of his officers, C. Volusenus, was sent to reconnoitre, but he did not venture to leave his ship and trust himself on shore. The authorities of the isle, seeing in Caesar no way deterred, sent this want of information, collected a fleet, and disposed his forces with a view to the descent.

Before entering upon the history of the Roman invasion,
we shall quote the description which Caesar gives of Britain in a subsequent part of his Commentaries.

‘The inland part of Britain is inhabited by those who according to the existing tradition were the aborigines of the island; the sea-coast by those who, for the sake of plunder or in order to make war, had crossed over from among them to the continent. For money they use copper or rings of iron of a certain weight. Tin (plumbum album) is produced there in the midland districts; and iron near the sea-coast, but the quantity of this is small; the copper which they use is imported. There is timber of every kind in plenty; and the Gauls esteem it highly. Nevertheless, it is unlawful to eat the hare, and the hen, and the goose; these animals however they breed for amusement. The country has a more temperate climate than Gaul, the cold being less intense.

The island is of a triangular form, one side of the triangle being the Gaul. One of the angles of this side, which is in Cantium (Kent), to which nearly all vessels from Gaul come, looks towards the rising sun; the lower angle looks towards the S. This side extends about 300 m. The next is the coast of Spain and Portugal; and along this side is Hibernia (Ireland), considered to be about half the size of Britain; but the passage across is of the same length as from Gaul into Britain. Midway in this passage is an island which is called Mona (Man); many smaller islands also its shores, consisting of which islands some have written that about the winter solstice they have night for thirty days together. We could not ascertain anything upon this point by inquiry; but we found, by using certain measures of water, that the nights were shorter than on the continent. The length of this island, according to the opinion of the natives, is about 700 m. The third side forms the N.; there is no land opposite to this, but one angle of it extends very much in the direction of Germany; this side is thought to be 800 m. in length. So that the whole island is 2800 m. in circumference.

‘Of all the natives, those who inhabit Cantium (Kent), a district the whole of which is near the coast, are by far the most civilized; and do not differ much in their customs from the Gauls. The inland people, for the most part, do not sow wheat, but live on milk and flesh, and have their clothing of skins. All the Britons however stain themselves with woad (see uro infectum), which makes them of a blue tinge, and gives them a more fearful appearance in battle: they also wear their hair long, and shave every year. It is the custom for them to dance in the upper lip. Every ten or twelve of them have their wives in common, especially brothers with brothers, and parents with children; but if any children are born, they are accounted the children of those by whom first each virgin was espoused.’ (Lib. v. c. 17.)

As to the religion of the Britons, Druidism flourished among them in all its vigour. Indeed this singular superstition was considered by the Gauls to have originated in Britain. A late writer observes that it is not without Oriental foundation, but not of Arabia, he says, ‘nor one part of a nation to another, in an age so destitute of the means of influence and of the habits of obedience, is not without resemblance to that system of antient Asia which confined men to hereditary occupations, and consequently vested in them a kind of idolatrous power founded in the exclusive possession of knowledge.’ (Sir J. Mackintosh, Hist. of Eng., vol. i. p. 9.) It is however to be observed, that the great feature of the Oriental system of caste—the hereditary descent of its occupations and privileges, is wanting in Druidism, as we learn from Caesar in the passage which we are about to quote. Nor do we think that either the influence which the superior knowledge and the priestly office of the Druids gave them, or the jealousy with which they guarded that knowledge from popular diffusion, can be regarded as the mark of orientalism, the first being the natural result of man’s reverence for superior intelligence and for every thing connected with his religion, and the second the manifestation of that selfishness the seeds of which are sown in every human heart. We subjoin here Caesar’s account of the Druids:

‘The Druids have three principal things: they have the charge of sacrifices, both public and private; they give directions for the ordinances of religious worship (religiones interpretatur). A great number of young men resort to them for the purpose of instruction in their system, and they are held in the highest reverence. For it is they who determine most disputes, whether of the affairs of the state or of individuals: if any crime has been slain, if there is a contest concerning an inheritance or the boundaries of their lands, it is the Druids who decide. When any person is carried off by storm or by fire, it is the Druids who make the regulations: if any one, whether in an individual or public capacity, refuses to abide by their sentence, they forbid him to come to the sacrifices. This punishment is among them very severe; those on whom this interdict is laid are accounted among the unholy and accursed; all fly from them, and shun their approach and their conversation, lest they should be injured by their very touch; they are placed out of the pale of the law, and excluded from all offices of honour.

Over all these Druids presides, to whom they pay the highest respect, among whom no one is of any account if there is any of the other Druids of superior worth, he succeeds; if there are more than one who have equal claims, a successor is appointed by the votes of the Druids; and the contest is sometimes decided by force of arms. These Druids have a consecrated spot in the country of the Carnutes (people in the neighbourhood of Chartres), which country is considered to be in the centre of all Gaul. Hither assemble all from every part, who have a liturgy, and submit themselves to the determination of the Druids. The length of this Druidism is thought to have been formed in Britain, and from thence carried over into Gaul; and now those who wish to be more accurately versed in it, for the most part, go thither (i.e. to Britain) in order to become acquainted with it. The law of the Druids is not consistent. They neither do they pay taxes like the rest of the community; they enjoy an exemption from military service, and freedom from all other public burdens. Induced by these advantages, many come of their own accord to be trained among them, and others are sent by the rest of the nation. They are said in this course of instruction to learn by heart a number of verses; and some accordingly remain twenty years under tuition. Nor do the Druids think it right to commit their instructions to writing, although in most other nations, in the opinion of modern authors, the Greek characters are used. They appear to me to have adopted this course for two reasons; because they do not wish either that the knowledge of their system should be diffused among the people at large, or that their pupils, being possessed of these religious characters, should become less careful about cultivating the memory; because in most cases it happens that men, from the security which written characters afford, become careless in acquiring and retaining knowledge. It is especially the object of the Druids to inculcate upon their pupils the right use of life after death, not pass into other bodies; and they consider that by this belief more than any thing else men may be led to cast away the fear of death, and to become courageous. They discuss moreover many points concerning the heavenly bodies and their motions, the order of the world, the nature of things, the influence and ability of the immortal gods; and they instruct the youth in these things.

The whole nation of the Gauls is much addicted to religious observances, and, on that account, those who are attacked by any of the more serious diseases, and those who are involved in the dangers of warfare, either profess sacrifices or make a vow that they will offer them, and they employ the Druids to officiate at these sacrifices: for they consider that the favour of the immortal gods cannot be contracted without an entire life of man being offered up for that of another; they have also sacrifices of the same nature pointed on behalf of the state. Some have images of enormous size, the limbs of which they make of wicker-work, and fill with living men, and set them on fire, the men are destroyed by the flames. They consider that the torture of those who have been taken in the-
mission of theft or open robbery, or in any crime, is more agreeable to the immortal gods; but when there is not a sufficient number of criminals, they scourge not to inflicts this torture.

The chief deity whom they worship is Mercury; of him they have many images, and they consider him to be the inventor of all arts, their guide in all their journeys, and the one who has the greatest influence in the pursuit of wealth and the affairs of commerce. Next to him they worship Apollo and Mars, and Jupiter and Minerva; and nearly resemble other nations in their views respecting these, as that Apollo wards off diseases, that Minerva communicates the rudiments of manufactures and manual arts, that Jupiter is the ruler of the celestials, and Mars is the god of war.

To Mars, when they have determined to engage in a pitched battle, they commonly devote whatever spoil they may take in the war. After the contest, they slay all living creatures that are found among the spoil; the other things they gather into one spot. In many states, her raising of these things in consecrated places may be seen: nor does it often happen that any one is so unscrupulous as to conceal at home any part of the spoil, or to take it away when deposited; a very heavy punishment with torture is denounced against that crime.

All the Gauls declare that they are descended from Father Dis (or Pluto), and this they say has been handed down by the Druids: for this reason, they distinguish all spaces of time not by the number of days, but of nights: the growth of crops is called a 'fruit,' (or fruitage,) and it lasts from two to three months and years, that the day shall come after the night. (Cæsar de Bell. Gall., lib. vi. 13, 14, 16, 17, 18.)

Although in what relates to or is closely connected with the system of the Druids, we have quoted that part of Cæsar’s account, nevertheless the Thesaurus Hibernicus does not have thoughts authorized in applying his description to Britain, by his declaration that the system existed in its greatest vigour in that island. Of the account which he gives of the civil institutions of the Gauls we do not feel ourselves completely justified in making the similar application, although it is likely that, in their political and social arrangements, a considerable similarity existed between the two countries, the Gauls being however more advanced in civilization.

In the autumn of the year 55 B.C., Cæsar, embarking with the infantry of two legions (about 8000 to 10,000 men) at the Portus Itius, (Wissand, between Calais and Boulogne,) arrived with part of his fleet, after a passage of about 10 hours, on the coast of Britain, and beheld the steep cliffs which line the shore of that promontory, ready to dispute his landing. Judging this to be an unsuitable spot for his purpose, after a delay of several hours to enable the rest of his fleet to come up, he proceeded about seven miles farther, and prepared to disembark on the open shore of the land. When he was on the point of which Caesar first touched was probably near the south Foreland, and he landed somewhere on the flat shore which extends from Walmer castle towards Sandwich. He did not make good his landing without a severe struggle. The storm, which had already been earned, and though somewhat incomplete, disposed the natives to submission; but the dispersion in a storm of some vessels, which were bringing over the Roman cavalry, and the damage sustained by the fleet which had conveyed Caesar, induced them to renew the contest, and to attempt, first, the surprise of the land, and then to attempt the sea shore with force, and next the attack of the Roman army. They were again beaten, and compelled to sue for peace; and Cæsar, anxious to return, consented himself with requiring an increased number of hostages, whom he commanded to be brought to him on the Continent, before which he immediately embarked. Two of the British States sent their hostages: the rest did not.

Early next year (54 B.C.), Cæsar, embarking again at the Portus Itius, made a landing in the north of Britain. His fleet consisted of 800 vessels of all classes, including some which belonged to private individuals; and the natives, who had assembles to oppose his landing, terred at the magnitude of his armament, retired in alarm from the coast. He landed in the same place as on the former occasion; and setting out about midnight in pursuit of the natives, found them drawn up on the bank of a river, (probably the Stour, near Canterbury,) to oppose his further progress. His cavalry drove them into the rear of their position, and one of his legions (the 7th) stormed a strong hold, formed of timber, which had been formerly constructed probably in some domestic war. This strong hold is supposed by Horsley to have been subsequently the Roman station of Duvernonium, near Canterbury. Intelligence that his fleet had been damaged by a storm obliged Cæsar to recall his troops from the pursuit of the enemy, and his own return to the coast to ascertain the extent of the damage and take measures for repairing the same, occupied him for some days. Upon his return to his former post he found that the natives had augmented their forces from all parts, and had entrusted the command in chief to Cassivellanus, (we use Cæsar’s mode of writing the name, perhaps the native form of it was Cass-wallon or Casswallon,) a prince whose territories were divided in the maritime states by the River Tamesis or Thames, at a part which was 80 Roman, or about 74 English, miles from the Kentish coast. This prince had been engaged previously in incessant wars with his neighbours; but the common danger compelled them to forego their disputes, and it is likely that his talents for war pointed him out as the most suitable person for general. But neither his caution and skill, nor the unadulterated valour, nor the increased number of the Britons, enabled them to withstand the superior discipline and arms of the Romans. A fierce battle took place in the line of Cæsar’s advance; and the natives had planted stakes, sharpened at the point, on the bank and in the bed of the river. All obstacles were however overcome: Cæsar, crossing the river, put the enemy to flight, received the submission of several tribes, and took by storm the town of Cassivellanus. These disasters, combined with the entire defeat of the princes of Cantium (Kent) in an attack upon the maritime camp which the Romans had formed to protect their fleet, induced Cassivellanus to submit. The conqueror demanded hostages, and was paid by the subject Britons, and returned to Gaul with all his forces and a number of captives.

It will be well here to notice the geography and ethnography of Britain, so far as the expedition of Cæsar brings it within our view. The following is a table:—

Some account for Romney marsh or the neighbourhood of Hythe. The question is whether Caesar’s account is to be understood as an advance towards the Severn or towards the south-west. Mr. Horsley (Jeuniaux, Roman Britain) shows it must have been towards the north.
Aeneas, Bibroch and Cassi submitted to Caesar before the final defeat of the British princes, the situation of whose capital they pointed out to the Romans. This prevents the supposition of his being by birth the ruler of any of them; yet if the Roman Verulamium was on the site of his town, this must have been in the territory of the Cassi, according to Cassius’s own account. It is not wise to conjecture it would be this: that Cassiellianus was prince of the people called Catuvellauni (Caetuvellanae) by Ptolemy, and Cautellian, Cattellian by Dion, who are given in the Society’s and other maps, as occupying the whole or part of Hertford, Buckingham, and Northamptonshire; that the original district of this people was much less than has just been stated, but that they had subjected to their sway the Trinobantes, the Cenomani and the other tribes, (except perhaps the people of Cantium,) mentioned by Caesar; that the Cassii and Catuvellaunii together revolted; but that, upon the departure of the Romans, they were again reduced to subjection, and, with the exception of the Trinobantes and Cenomani, so completely subdued as to have lost their distinctive appellations, and to have been therefore included by Ptolemy under the name and in the description of the conquering tribe. The fact that Caesar does not mention the Catuvellauni, nor Ptolemy the subjected tribes, unless under different names, is favourable to this conjecture. The Trinobantes, whose independence Caesar took pains to secure, appear in a state so independent that their name survived; they have only to have retained their independence, but rose, probably in consequence of their alliance with Rome, and their greater advance in civilization, to the position of a leading state.

The success of Caesar was certainly not such as to induce him to make the necessary reduction of the island; and from some passages in ancient authors it has been conjectured that his success was not so great as he has represented it. However that may be, the Romans did not return to the island until the reign of Claudius, and during the reign of that emperor the country was taken so far as to threaten an attack. In the interval those of the Britons who dwelt in the parts nearest to Gaul appear to have made some progress in civilization. They coined money, and many British coins have been discovered, of which a specimen is a golden one, though of a small size, found at Chesters, known to be a city of Cunobelin (so on his coins, Cunobellinus in Suevius, Cunobellro in Dion Cassius), whose residence was at Camulodunum (either Colchester or Maldon), and whom we should therefore take to be king of the Trinobantes, the people of that part of the country. It is likely that a conjunction was maintained after Caesar’s departure between the Romans and the Trinobantes, who would desire to enjoy the protection of the Roman name and influence (as did the Durotriges and Noviodunum in Gaul), while the Romans would be willing to keep up an alliance in the island, which was of too much use to them whenever they were disposed and able to resume their scheme of conquest. The money of Cunobelin is supposed to have been the work of a Roman artist, or of some Gaul familiar with Roman coinage. The subdued engraving is from a coin, one of several of Cunobelin, in the British Museum.

But however the Trinobantes may have been pleased with the support of their Roman friends while they could remain their own independents, at the same time they were by no means willing to surrender this whenever the ambition of those friends chose to demand it. We consequently have the loss of Boudicca’s power, and the invading force sent by the Emperor Claudius, while the Catuvellauni (whom we have conjectured to be the people of Catullianus) took either no part or at least not a prominent one, and this not from want of power, for we find from Dio (Boudicca’s surrender was to the Dobunni and Gloucestershires) they were subject to them. Perhaps the Catuelli were of Celtic race, and the Trinobantes of Belgic origin; and this circumstance, together with their rivalry in other respects, prevented their combining for the general good in a cordial manner. Aulus Plautius, a senator of praetorian rank, com-

manded the forces which were designed for the attack on the island (A.D. 43). The Romans were instigated by a British fugitive whom Dion calls Bœdoe (Berenus). The Roman soldiers were at first unwilling to leave their quarters in Gaul to engage in an expedition beyond the boundaries of the world, but were prevailed on to embark. The Britons did not resist, and entertained the Roman troops with all the hospitality they could. The power of the Dobunni (C Lydia) of Ptolemy, who dwelt in and about Gloucestershire, submitted. From the country of these new subjects Plautius advanced to a river (supposed by some to be the Severn), thought by the Britons to be impassable without a bridge; and sending one of his Gallic auxiliaries, and after them his lieutenants, the brothers Flavius Vespasianus (afterwards emperor) and Sabinus made considerable slaughter. The attack was not however decisive, for the battle was renewed the next day; and it was not until after a hard struggle that the Britons yielded. From this part of the country the vanquished natives retreated eastward to the marshes near the mouth of the Thames (Tityra, Dion) the marshes of Essex), where another stand was made with great slaughter and considerable loss. The Britons were determined to appear to have fallen; and the Britons, roused by the desire of vengeance to greater efforts, exerted themselves so vigorously that Plautius (as we gather from Dion) withdrew to the south of the Thames to await the arrival of the Emperor Claudius, who at length arrived and was received with much enthusiasm, and non-combatants, including some elephants; and landing at Maldon proceeded through Gaul to Britain. Upon his arrival he crossed the Thames with his army, defeated the natives who had assembled to oppose him, took Camulodunum or Colchester (Caesaraugusta, Dion), the capital of Cunobelin, and forced many of them to submit at discretion, or at least at discretion or on terms. After this success Claudius dispersed the vanquished tribes and returned to Rome, leaving Plautius to secure and enlarge the Roman conquests. (Dion Cass. Hist. Rom. The senate decreed triennial games in the Temple of Castor, where a statue of Plautius had been erected in his lifetime, and the victory had been perpetuated in his coinage. An ancient inscription ascribes to him the addition of the Claudii to the Roman empire. The coin of which we give an engraving is one of those commemorating his British conquests.

The success of Plautius obtained for him that kind of triumph which was reserved for Augustus; for this was for any great exploits performed by him after the departure of Claudius we are not informed. (Dion, as above; Suetonius.) Some time during his command, his lieutenants Vespasianus conquered the Isle of Wight, and had considerable success probably against the tribes of the south coast. Upon the departure of Plautius, those Britons who were subdued for independence overran the lands of such as bad allied themselves with or submitted to the Romans; and P. Ostorius Scapula, who succeeded Plautius (A.D. 50) as governor, found affairs in the greatest confusion. He immediately pursued these invaders, and prepared to restrain their incursions by stations or camps at the rivers Sabrina (Severn) and Antonia or Auntra (Nene). The line which Plautius thus proposed to defend was placed within it all the southern and south-eastern parts of the island, including nations who for the most part were of Belgic origin, and who had either submitted without a struggle to the Roman sway, or had been subdued by the Romans and willingly embraced the Roman alliance. This part of the island was inhabited by the

*Suetonius (Claudius, c. 17) says Claudius received the submission of a part of Britain without a battle and without bloodshed. (civis suo pacifico assis-"
The tribes mentioned by Caesar and given in a foregoing table; by the Iceni and Atrebati, who are supposed by many to be mentioned by Caesar under the names of Cenomani and Atrebates; by the Catuani and Catuvexians, whom we have conjectured to be the native tribe of Cassiabrius; and by the Dobunni; and by the following people not yet noticed:

- Damnonii or Dumnonii (Firm, Anton.)  
- Dobroterii (Plut.), people of Devonshire and Cornwall.
- Durotriges (Procop., Plut.), people in and about Dorset.
- Belgae, Batucae (Plut.), people of Somersetshire, Wilts, and Hants. The name of their capital, Venta (Cassivellaunus, Plut.) is preserved in Winchester.
- Regni (Procop., Plut.), people of Surrey and Sussex.

His name had never been subdued: they had allied themselves with the Romans willingly, but they saw that, if Ostorius severed the island into two parts by a line of military posts, the independence of all within that line would be sacrificed. They consequently opposed his plan, roused their neighbors (probably the Trinobantes and Catuani) to the contest, and fortified themselves in a strong position. The active Ostorius immediately marched against them, stormed their camp in spite of an obstinate resistance, and decided by this success the conduct of those tribes. He then marched between the Silures and the Genti, and when he then marched against the Canii, a people whose position has been so variously placed that it seems vain to offer any further conjectures. What seems to have created much difficulty is a supposition that they were connected with the Iceni as neighbors, perhaps as subjects of that nation, and that Tacitus, in all probability, refers to this supposition when he is contumaciously charged by Tacticus. That historian tells us that the defeat of the Iceni having quieted those who were hesitating between war and peace, (by which we understand the tribes south and east of the line proposed by Ostorius,) the army was led north to the west of that line or without it, and somewhere near the Irish sea, to which Ostorius had nearly reached, when he was recalled to the east coast by a rising among the Brigantes (Procop., Plut.), the people of Yorkshire and Lancashire. He then marched against the Silures or Silvii (Procop., Plut.), a people of South Wales, whom Tacticus (Agric. x.i) supposes (apparently without any good reason), from their dark complexion, curled locks, and western locality, to have been of Iberian origin, and whose resistance to the Romans was more obstinate than that of any other people of South Britain. That no apprehension of a rising in his rear might impede his progress he settled a colony of veterans at Camulodunum to repress the Iceni and other neighboring tribes and to insure the conquered to the yoke of the Romans.

Although the name of Cataractaeus, or, according to the orthography of Tacticus, Cataractaeus, has not been mentioned since the notice of Plautius's first campaign, that valiant prince appears to have kept the field. The extent of country over which that campaign extended indicates that the authority which he held was not confined to the Trinobantes, of whose nation we have supposed him to be the hereditary prince: he was probably, with his brother, at the head of a large body of numbers, which was under the command of Julius Caesar. Upon the subjugation of his own tribe he had probably found willing soldiers among other tribes; many actions with the Romans, some successful, some doubtful—and in so unequal a contest to avoid defeat was as glorious to victors as it was ignominious to be vanquished—and given it celebrity even in Rome itself; and his presence among them as their commander added to the military confidence of the Silures. (Tacit. Ann. xii. 33, 38.)

The seat of war was transferred into the country of the Ordovices (Opécatus, Plut.), people of the Lake District in northern Shropshire by Cataractaeus, whose army was reinforced by such fears the Roman yoke, and who now determined to make a decisive stand against the Romans. He posted his forces upon a steep ascent, and fortified the approaches by a rampart of loose earth, which he hardened to the height of thirty feet, so that no man could pass it in front of his strong position, and his best troops took their station in front of the ramparts. He animated his men by his exhortations, declaring that 'on that day and that contest it depended whether they should recover their freedom or have to bow under an eternal yoke; and reminded them of their ancestors who had repelled the dictator Caesar, secured themselves from the punishments and burdens of the Romans, and preserved undefiled the persons of their women and children. The Britons responded to the exhortations of their commander. But their native valour was unequal to the resisting an army so superior in numbers. Their position was stormed; the victory was complete; the wife and daughter of Cataractaeus were taken; his brothers surrendered themselves; and the gallant prince himself was put in chains by Cartimandua, queen of the Brigantes, and the daughter of whose tribe he had been taken up to the Romans. His unbroken spirit and noble demeanour when at Rome before Claudius commanded the admiration of that prince: he was spared the death which the cruel policy of Rome too commonly inflicted on captured princes, and was permitted choosing an attack as unjust as it was irresponsible. (Tacit. Ann.) His subsequent history is unknown. His defeat and capture probably took place A.D. 51.

The insignia of a triumph were decreed to Ostorius; but his success ended with the defeat of Cataractaeus. An officer left with some cohorts to fortify a permanent station among the Silures was slain, and his men nearly cut off; and shortly after the Roman foragers were attacked, and with the troops sent to their aid routed; and it was only by marching up his cohorts that Ostorius could check the flight, and restore the fortune of his army. The Romans were harassed after this with repeated skirmishes, and the obstinate resistance of the Silures was stimulated by a declaration of Claudius 'that their very name must be blotted out,' and that 'they were only the vestiges of the Idus, the captives.' He ordered them to draw the other natives into the struggle, and Ostorius died worn out with care (perhaps A.D. 53.); the Silures exulting at his death, and declaring that 'though he fell not in battle, yet it was the death which brought him to the grave.'

Deditius, the successor of Ostorius, found the Roman affairs in a very depressed condition. An entire legion had been defeated by the Silures, who spread their incursions on every side until restrained by the approach of the new commander. Venutius, a Brigiantian, had married the queen of Caturantes, the betrayer of Cataractaeus. Matrimonial disputes, in which the Romans interfered, brought on a war with this chieftain, who, after the capture of Cataractaeus, was the most eminent commander of the Britons. Didius does not appear to have gained any signal advantage. His command lasted into the reign of Nero, the successor of Claudius, probably till A.D. 57.

Veranus, the successor of Didius, lived only a year after undertaking the command, and did little in that interval; but his successor, Paulinus Suetonius, obtained more distinction in his campaign. He had an army stationed in Armenia, and Suetonius was anxious to gain in the W. a name equal to that which Corbulo was acquiring in the E. He attacked the island of Mona (now Anglesey), transhipping his infantry over the straits which divide that island from the mainland (the Menai) in flat-bottomed boats, fording the passage, or in the deeper parts swimming. The description of this attack, as highly characteristic of the people of the island, we give in the words of Tacticus. (Annales, l. xiv. c. 50.)

In the summer of this year a line of very diversified appearance, there were armed men in dense array, and women running amid them like furies, who, in gloomy attire, and with loose hair hanging down, carried torches before them. Around them were Druids, who, pouring forth curses and lifting up their hands to heaven, tried to break the spirits of the Britons and strike terror into the hearts of the soldiers, who, as if they had lost the use of their limbs, exposed themselves motionless to the stroke of the enemy. At last, moved by the exhortations of their leader, and stimulated one another to destroy their enemies, the Britons, as the Druids had foretold, overthrew their opponents and involved them in the flames which they had themselves kindled. A garrison was afterwards placed among the vanquished; and the groves consecrated to their cruel superstitions were cut down. For they held it necessary to tie saints, they made their lives replete with the blood of their captives, and to consult the will of the gods by the quivering of human flesh.

From the shores of the extreme W. Suetonius was recalled by the news of a great rising of the natives under Bouidicea, in that part of the island which had been already subdued by the Romans. (Boadicea.)
The revolt of Boudicca had nearly extinguished the Roman dominion in Britain, but at last the natives were completely defeated in a battle, the scene of which is supposed to have been just to the N. of London. Battle-bridge, St. Pancras, is thought to have preserved in its name a memorial of this dreadful day. (Nelson's Hell of Islington.) The Roman general ravaged with fire and sword the territories of all those native tribes which had wavered in their attachment to the Romans, as well as those who had joined in the revolt; but even hunger did not induce them to submit. The event of civil war or rather factional strife of the Romans quarrelled with Suctonius, and though the latter retained the command for a time longer, he was at last recalled without finishing the war (A.D. 62), and Petronius Turpillianus appointed his successor. Under the milder treatment of the new general, the revolt seems to have subsided.

Several generals were successively sent to the island; but the Romans made little progress until the time of Vespasian, A.D. 70-75, in whose reign Pothinus Cerealis subdued the Brigantes, who, under Venutius, had renewed hostilities; and Julius Fronto subdued the Silures. But the glory of completing the conquest of South Britain was reserved for Cnaeus Julius Agricola, whose actions are recorded by his son-in-law the historian Tacitus. [Agricola.]

In the year of our Lord 80 Agricola, who had been a proconsul of Asia, was sent by Augustus to suppress the recent disturbances of the same nation. The Romans were in great numbers, and the Britons were without animated by a common purpose and a spirit of cohesion. The Romans advanced with all the energy of which they were capable, and the Britons fought with all the spirit which they were capable of. The battle was fought on the banks of the Thames, near the site of the present town of Dover, and the Britons were defeated and nearly destroyed. The Roman general, who was victorious, was Julia Agricola, the son of Augustus, and the Britons were led by their chief, Calgacus. [Julius Agricola, Life of Hadrian.] In the subsequent reign of Antoninus Pius (A.D. 138 to 161), Roman enterprise seems to have revived a little. Lollius Urbicus, his lieutenant in Britain, drove back the barbarians, and recovered the country as far as A.D. 168, under the command of Severus between the Firth and Clyde. [Antoninus, Wall of.]

In the following reign of M. Aurelius Antoninum (A.D. 161 to 180) we have some notice of wars in Britain, which Calpurnius Agricola was sent to quell. (Capitolinus, Life of Aurelius Antoninum.) The Caledonians probably broke through the wall of Antoninus in the reign of Commodus, son of Aurelius, if not during the reign of Aurelius himself. Commodus sent against them his lieutenant, Ulpian Marcellus, an able leader, who defeated the Caledonians with heavy loss. A great mutiny among the legions in Britain occurred during the reign of Commodus, which was with difficulty quelled by Pertinax (afterwards emperor), one of the successors of Marcellus in the government of the island. Pertinax was probably succeeded as governor by Claudius Albinus. (Horsley.)

The contest of this Claudius Albinus with Severus for the empire belongs rather to the history of Rome generally than to that of Britain in particular. The contest was ended by the fall of Albinus at the battle of Lugdunum (Lyon) in France, very near the close of the second century. It is not unlikely that Claudius had in a great measure drained the province of its troops in order to strengthen his own army against Severus, and that the northern natives took the opportunity of reviving hostilities, breaking into the Roman province, and spreading desolation far and near.

Induced by the unfavourable tenor of the intelligence from the island, Severus, though now growing aged and infirm, resolved to undertake the conduct of the war in person, and accordingly crossed over into the island A.D. 206 or 207. The natives, terrified at his approach, would have submitted, but Severus dismissed their ambassadors, and continued his military preparations. Advancing beyond the limits of the territories, he met the Boii, who, in their flight, advanced through a difficult country, where he had endless fatigues to sustain. There were morsasses to drain, or cause-ways to form across them, forests to cut through, mountains to level, and bridges to build; and so much were the Roman soldiers worn out that the emperor lost, says Xiphilin, 50,000 men. The natives do not appear to have come to a pitched battle, so that the campaign was not marked by any brilliant exploits.

Two people, the Maetae (Morvan), who dwelt nearest to the Romans, and the Boii, who were more remote, were the great objects of the emperor’s hostility. These tribes appear to have been at the lowest stage of civilization, as much so as their southern brethren at the time of Caesar’s first invasion. They wore little clothing, and painted or otherwise marked upon their bodies the figures of divers animals: a small target or shield, a spear, a poniard, and, as we learn from Tacitus, a cumbersome unpointed sword, composed their offensive and defensive arms. They had neither walls nor towns, but lived in tents. pastoral was their chief occupation. They ate the flesh of such animals as they took by hunting. The community in women, noticed by Caesar, appears to have existed among them. (Herodian and Xiphilin, quoted by Horsley, Brit. Rom.)

It was during this war that Severus ordered the erection of the famous wall which stretches across the island, from the Solway to near the mouth of the Tyne. The length of this wall, owing to the corruption of the text of ancient authors, is given with great diversity. It is probable that the true measure of this wall was but a little less than that which is rather more than the length assigned to Hadrian’s rampart of turf, which was near this wall, and extended in the same direction. Remains of both these great works exist, and though we have not room for a very full description, yet some account of them cannot be considered as misplaced.

It appears that three great Roman works have crossed the island at this part. The first is supposed by Horsley, and after him by Warburton (Vallum Romanum, 4to. Lond. 1753), to have been simply a road, or perhaps a military way between them. This line of stations is by the above writers ascribed to Agricola; conjecturing guiding them, we believe, rather than testimony. The extent of the works is of Agricola is however disputed. Hutton ascribes to him an agger or earthwork along the Firth, and a second agger or rampart outside the northern ditch. Without attempting to settle this dispute, it may be observed that the works thus ascribed partly to Agricola and partly to Hadrian have throughout a parallel direction, from which some has been considered that the station was formed by the person. The rampart of Severus, which is of stone, is for the most part, but not invariably, parallel to that of Hadrian; it lies to the N. of it, and extends rather farther at each end. It is accompanied throughout, as the following extract will show, by a military road, or indeed by several military roads. We take the following description from Hutton, as conveying the best information as to the works themselves, without affording the correctness of his statement as to their authors:

There were three different works in this grand barrier, performed by three personages, and at different periods. I will measure them from S. to N., describe them distinctly, and appropriate each part to its proprietor; for although every part is dastirfully mutilated, yet by selecting the best of each we easily form a whole; and from what is, we can nearly tell what was. We must take our dimensions from the original surface of the ground.

Let us suppose a ditch, like that at the foot of a quickset hedge, 3 or 4 ft. deep, and as wide; a bank rising from it high enough to throw the bank into the bank; this, with the ditch, will give us a rise of 13 ft. at least. To the other side, the bank sinks into a ditch 10 ft. deep and 15 wide, which gives the N. side of this bank a declivity of 20 feet. A small part of the soil thrown out on the N. side of this 15 ft. ditch forms a bank 3 ft. high and 6 wide, which gives an elevation from the bottom of the ditch of 12 feet. Thus our two ditches and two mounds, sufficient to keep out every rogue
but he who was determined not to be 'kept out,' were the work of Agricola.

The Antonii of Hadrian invariably join those of Agricola. They always correspond together as beautiful parallel lines. Close to the N. side of the little bank I last described, Hadrian sunk a ditch, 24 ft. wide, and 12 below the surface of the ground, which, added to Agricola's 3 ft. bank, forms a ditch 27 ft. wide, and 15 ft. deep, on the N. 12. Then follows a plain of level ground 24 ft. wide, and a couple of swales, exactly the same as Agricola's, 10 ft. high, and 30 in the base; and then he finishes, as his predecessor began, with a small ditch of 3 or 4 feet. 

'They consist of a stone wall 8 ft. thick, 12 high, and 4 the battlements; with a ditch to the N. as near as convenient, 36 ft. wide, and 15 deep. To the wall were added, at unequal distances, a number of stations or cities, said to be 18, which is not perfectly true; 81 castles, and 330 castles, or turrets, which I believe is true, all joining the wall.'

Exclusive of this wall and ditch, these stations, castles, and turrets, Severus constructed a variety of roads, yet called Severius's works run for a 7.-lie on the N., and never far distant; but may be said always to keep them in view, running a course that best suited the judgment of the maker. The nearest distance is about 20 yards, and greatest near a mile, the medium 40 or 50 yards.

'Theodoreus (father of the emperor of that name), being sent over as governor, found the northern people plundering Augusta (London), so that the whole province must have been overrun by them. He drove them out, recovered the provincial towns and forts, re-established the Roman power, and gave the name of Valentine either to the district between the walls of Antoninus and Severus (Richard of Cirencester, Roy), or, as they think, to a part of the province south of the wall of Severus.'

When Gratian and Valentinian II. associated Theodosius (son of the above) with them in the empire, Maximus, a Spaniard, who had served with great distinction in Britain, was a marked person. The emperor shewed to preference shown to another, and raised in the island, where he had been a panegyric of various considerable force, he proceeded over to the continent, defeated Gratian, whom he ordered to be put to death, and maintained himself for some time in the possession of his usurped province.

Having to overcome by Theodosius, and the province returned to its former position in the empire.

The Britons who had followed Maximus into the continent received from him possessions in Armorica, where they laid the foundation of a state which still retains their language and their name.'

Sotho, whom name is one of the most eminent in the degenerate age in which he lived, served in Britain with success, if we may trust the panegyrics of Claudian; and the time and particulars of his service are not known. Perhaps it was in the third or fourth unhappy province after his departure was again attacked by the Saxons, irritated by the licentiousness of the Roman soldiers, who successively set up three claimants to the imperial throne,—Marcus, Gratian, and Constantine. The first and second were destroyed in the great battle in which they had raised them. Constantine was four times more eminently. Raising a power among the youth of the island he passed over into Gaul (A.D. 409), acquired possession of that province and of Spain, and fixed the seat of his government at Arles, where he resided. After the death of A.D. 201 or 211. He appears to have carried his arms far into Scotland, and probably fixed the boundary of the empire at the rampart of Antoninus, though his erection of a wall near the sea was a proof that he thought the intermediate territory either of little value or of uncertain tenure. His son Caracalla, soon after his death, surrendered a great part of this territory when he made peace with the Caledonians, and probably retained only a few forts and places of transit. From this period many years elapsed, and many emperors reigned, without the occurrence of any event of importance in Britain. In the reign of Diocletian and Maximian, Carausius, a Menapian (the Menapians were a people of the Netherlands who commanded the Roman fleet in the North Sea against the Frankish and Saxons pirates, seized Britain and assumed the purple (about A.D. 288); and such was his activity and power, that the emperors consented to recognise him as their partner in the empire. He was however after some years killed by Allectus, one of his successors (c. 297). Gratianus, however, damnably in 309) Britain was recovered for the emperors by Asclepiodotus, captain of the guards. Upon the resignation of Diocletian and Maximian (A.D. 304), Britain was included in the dominions of Constantius Chlorus, one of their successors. This prince died in Britain at Eburocum, A.D. 307, after having undertaken with some success an expedition against the Caledonians. His son Constantine the Great also carried on some hostilities with the same people and the Meatae. The northern tribes now began to be known by the names of Picts and Scots.

The Roman power was now fast decaying, and the provinces were no longer secure against the irruptions of the savage tribes that pressed upon the long line of their frontier. Britain, situated at one extremity of the empire, suffered during this period. The Picts, Picts, Picts, Picts, Cotti, and Saxons infested the coast. In the reign of Valentine, probably in the year

"general Roy, Wilt. Antiq. of the Rom. in Brit. gives the length of the Wall of Severus at 606 English or 78 Roman miles."

387. Theodosius (father of the emperor of that name), being sent over as governor, found the northern people plundering Augusta (London), so that the whole province must have been overrun by them. He drove them out, recovered the provincial towns and forts, re-established the Roman power, and gave the name of Valentine either to the district between the walls of Antoninus and Severus (Richard of Cirencester, Roy), or, as they think, to a part of the province south of the wall of Severus.

When Gratian and Valentinian II. associated Theodosius (son of the above) with them in the empire, Maximus, a Spaniard, who had served with great distinction in Britain, was a marked person. The emperor shewed to preference shown to another, and raised in the island, where he had been a panegyric of various considerable force, he proceeded over to the continent, defeated Gratian, whom he ordered to be put to death, and maintained himself for some time in the possession of his usurped province.

Having to overcome by Theodosius, and the province returned to its former position in the empire.

proved so fatal to the island. The *Dei Britanniarum* had the charge of the Wall of Severus and the command of the N. district, with its garrisons and military posts. We are inclined to think the *Comitum Britanniarum* was also a military officer, and that he had charge of the W. and S. districts, which, as being less exposed to hostilities, were bare of troops.

The situation of the five prov. of Britain, according to Richard of Cirencester (a monk of the 14th cent., whose work was discovered and published at Copenhagen about the middle of the last cent., and whose authority, though disputed by some, is apparently trustworthy), was as follows. We give them in a tabular form, with the nations which occupied each.

**BRITANNIA PRIMA**, the country S. of the Thames, and the Bristol Channel, including the territories of the

**FLAVIA CASARIENSIS**, the territory N. of the Thames, E. of the Severn, and probably S. of the Mersey, the Don which joins the Yorkshire Ouse, and the Humber; comprehending the territory of

| Carnabi   | People of Cheshire, part of Shropshire, and some adjacent districts. |

Richard of Cirencester considers the Cassi and the Catuvenculi to be the same people; we do not agree with him. The same writer considers that the Cassi and Dobanti made up the kingdom or rather the republic of the

| Catuvenculi | People of the counties of Lincoln, Nottingham, Leicester, and the adjacent parts. These people seem to be regarded by Richard as a subdivision of the Iceni. The Iceni, properly so called, gives us the other subdivision, calling them

| Dobanti    | The two nations confederate together, according to Richard, not mentioned by Ptolemy; they inhabited Lancashire or part of it. |

**MAXIMA CASARIENSIS**, the country from the Mersey and the Humber to the Wall of Severus, comprehending the territory of the

| Brigantes  | Mentioned already. |

**PARTI**

| People of the East Riding of Yorkshire. |

**Volantini**

| Two nations confederate together, according to Richard, not mentioned by Ptolemy; they inhabited Lancashire or part of it. |

**VALENTIA OR VALETIANA**, the country between the Wall of Severus and the rampart of Antoninus, including the B.

part of Scotland, the county of Northumberland, and part of Cumberland, comprehending the territories of the

| Gatareni   | The inhabitants of the E. coast of Northumberland and the adjacent coast of Scotland. |
| Gaddeni   | These people dwell to the W. of the Gatareni in Northumberland, in Roxburgh, Selkirk, Peebles, and Lanark-shires. |
| Selgovae  | The inhabitants of Durnfries and part of Kircudbright-shires. |
| Nervanis  | The inhabitants of Wigtownshire. |

The remnant of the island was never long in the power of the Romans. Agricola overran part of it and established some stations; and probably other commanders after him brought it into temporary subjection. The part which Agricola subdues is termed by Richard

| Vosfrasiansa | The inhabitants of the coast between the rampart of Antoninus and a line drawn from the Moray Firth to the Varans, which is the mouth of the Clyde, and comprehending the territories of the
| Horestii, mentioned by Tacitus but not by Ptolemy; it is likely they occupied the portion of the territory of the
| Dammini which lay beyond the wall; they were S.W. of the Tay. |

The differences between Richard and Ptolemy with respect to this people makes it uncertain whether we are to assign them to

| Fiveshires or Angus. |

| Vecturones or Venricones Osuscularis |

| Venricones Osuscularis |

| Inhabitants of the coast of Aberdeenshire. |

| Teutones |

| Their chief town, Devana (Devon), was probably Old Aberdeen. |

The range of the Grampians towards the

| N.B.; Banff, Moray or Murray, Nairn, and the part of Inverness-shires. |

| Dammini Albanii, not mentioned by Ptolemy: parts of Perth, Argyile, Stirling, and Dunbarton-shires. General Roy considers Albanii to mean mountaineers. [ALHOUN] |

| Perhaps they are comprehended by Ptolemy among the
| Dammini (Dumnoni, Valentinii). |

| Altaricci, not mentioned by Ptolemy but by Antoninus Marcellinus. They have been noticed in the course of the preceding historical sketch. They inhabited, according to Richard, the country on the bank of the Clyde and on the banks of the great lake Llynclaid, supposed to be Loch Lomond. |

Richard supposes that this province of **VALENTIA WAS**, in the time of the later emperors, called **THULE**: to the rest of Scotland he gives the name of

| Caledonia, comprehending the territories of the following people:— |

| N.W. of the Murray Firth and Loch Ness. The immense Caledonian Forest covered their territory or rather skirted it to the N.W. Ptolemy seems to make them extend in a S.W. direction as far as Loch Fyne; thus assigned to them parts of Inverness, Perth, and Argyile-shires. |

| Canta |

| Inhabitants of parts of Ross and Cromarty-shires. |

| These two names seem to have inhabited the E. coast of Sutherland and Caithness-shires. The name of the Logi is preserved in that of the modern parish of Loch. Richard intimates that the Carnabii were a colony of the people so called in South Britain, who abandoned their territory in conjunction with the Cantii, upon the Roman conquest, and settled here. If there be any truth in this account we may perhaps identify the Cantii with these wandering Cantii. |

*Yrbst*, as it is correctly written in the Latin edition of Ptolemy by Perchorbrequ. The same genealogy still exists in Strath Pears, the upper end of the Moray Firth. |

Jovis (Jovis, iun. Ant. Jovis), now Dover.
Bremena (Bremena), now Rivers, Northumberland.
Very doubtful position.

Durobrivae, now Rochester.

In the above list we have given the orthography of Richard, noting any variation between him and the Itinerary of Antoninus. The Greek names as usual are from Ptolemy. The list of Municipia and Coloniae, it should be added, is by no means complete.

Though we do not possess such materials as enable us to form a connected history of the Roman settlement and administration of Britain, yet from the scanty fragments of its history during this period, and our more exact knowledge of the state of civilized nations, we are enabled to make some general conclusions which cannot involve any serious error.

As to the population of the island we must conceive that it received a very considerable mixture of Roman and foreign blood. Consols, i.e. the sons of the Roman soldiers; and such of them as settled permanently, or even remained for a few years, would doubtless have children by native women. It was the policy of the Romans to employ the native troops of one prov. in the conquest or military administration of others; and all native blood in this respect would be brought under the dominion of the Romans, and be finally reduced to the same condition as the natives of the empire. The Greek language would be that of administration, and most probably that of judicial proceedings also; and all natives or persons of mixed blood who were allowed to enjoy any civil employment (which in the course of time could hardly have been denied to the natives) must have learned the Greek language and laws. To this period belongs also the first introduction of Christianity [ARCHHIST., vol. ii. p. 269], which necessarily was accompanied with a knowledge of the sacred language, but the people of that age were totally lost during the times that followed the Roman domination (a fact which we do not believe), or only preserved among a few learned ecclesiastics, it is now well known that its supposed first introduction after the Gallic revolution has, in truth, been disproved by abundant evidence. The strong walled cities, either founded by the Romans or built on the sites of British towns, such as Cirencester, Silchester, Burgh Castle, Richmond Castle, and others, of which great remains still exist, sufficiently
indicate that the possession of the island was considered insecure without these strong holds, while they show that the formation of large towns, the centres of civilization, was a part of the Roman system. These towns were the stations of the military force required to keep a given district in order, to enforce the payment of taxes, and generally to provide for the defence of the island. Many of these walled towns were evidently built with a view to trade, both foreign and internal; they would form the great markets, and would of course contain the courts of justice. These towns, under the names of Colonia, Municipia, &c., received municipal institutions similar to the towns of Italy, Gaul, and Spain; and thus the Romanized inh. of Britain were probably introduced under their foreign masters to the rudiments of this important branch of political science, the construction and administration of municipalities. It is a point of curious inquiry, not yet, so far as we know, fully discussed, to ascertain how far the Saxons, on their invasion of the island, moulded or adapted their political institutions to those which they must have found existing in Roman Britain. The Saxons, we know, ultimately possessed themselves of all the Roman walled cities, of which they formed their boroughs [see BOROUGH]; and it is hardly conceivable that a comparatively small body of invaders would completely overturn all those municipal institutions, which, though less free than their own, would present them, so far as administration was concerned, with useful means for securing and consolidating their acquisitions.

BRITANNICUS, son of the Emperor Claudius, and of his third wife the infamous Messalina, was born on the 11th of February, A.D. 42, on the twentieth day after his father’s accession, and was at first named Tiberius Claudius Germanicus, a name which was changed in honour of the subsequent conquests in Britain. [BRITANNIA.] When only six years old, while exhibiting before his father in the mimic fights called Troja, during the Cirensian games, the wishes of the populace seemed to incline in favour of L. Domitius, the son of Agrippina, who headed the opposite band, and who afterwards succeeded to the imperial dignity under the title of Nero. On the death of Messalina, and the marriage of Claudius with his niece Agrippina, Octavia, sister of Britannicus, who had been betrothed to Slianus, was given in marriage to Lucius Domitius, and pains were taken by the courtiers, who had procured the death of Messalina, to elevate the adopted prince to equal honours with the son whom Claudius had hitherto acknowledged as his heir.

At the Cirensian games Britannicus appeared in the praetexta or youthful dress; Nero in a triumphal robe; and the populace formed their opinion as to the future fortune of each accordingly. When the boys met each other afterwards, Nero saluted his playfellow as Britannicus; Britannicus replied to him only by the family name of Domitius. Agrippina expressed great indignation at this affront, and complained to her husband Claudius that his adoption was treated with contempt—that the decree of the senate and the command of the people were abrogated within the palace walls—and that if a stop were not put to the perverseness of those preceptors by whom Britannicus had been instructed, public disasters must ensue. Claudius, much moved by the answers of his excellent tutors who had hitherto brought up his son, and placed him under the care of others recommended by his crafty step-mother.

When the intrigues and the crimes of Agrippina had obtained the imperial dignity for her own son, Britannicus necessarily became an object of suspicion to Nero, whose fears were by no means diminished by the threats in which his mother indulged upon the banishment of her lover Pallas. She took care indeed not to conceal her menaces to himself, so that when the young prince found himself only the true stock of the Cassars, and alone worthy to succeed to his father’s empire, while Nero was only adopted into the family of the Cassars. Little solicitus as to the revelation of her foul deeds, she rejoiced that her own providence and the gods had permitted the survival of her step-son, and she declared that she would accompany him to the camp, and demand from the soldiers his elevation to the throne, without fearing the futile arguments which might be urged against her by the unwarlike soldier Burrus, or the wordy rhetorician Seneca, who ought to guard against her.

Britannicus was near the completion of his fourteenth year, and Nero, who was well acquainted with the violence of Agrippina, had recently discovered how much popularity the young prince retained. Among other sports of the Staturomba he was constituted Brutus, and his name was to be thrown dice for the kingship of the evening. Nero, who on one occasion happened to be the successful castor, issued his orders to each of the company to do some offensive trifle; but when it came to the turn of Britannicus, Nero commanded him to make the sacrifice. The boy calmly obeyed, and began a song which implied that he had fallen from his patrimony and from sovereignty; lines which the keen-sightedness of the commentators of Ennius have determined to belong to the Andromache of that poet. The imperial guests were drowsed, the courtiers less on their guard than usual, and a sentiment of pity was evidently excited among them. This incident, combined with the threats of Agrippina, determined Nero to remove Britannicus by poison, and he employed Locusta (whose name is rendered familiar to us by Juvenal) to assist his purpose.

The poison first administered was ineffectual; but Nero, impatient of delay, threatened Locusta with punishment, (and, as Suetonius adds, beat her with his own hand,) till she furnished him with a potion so strong that she affirmed to be 'as rapid in deadly effect as the sword itself'; it was prepared by the bedside of the emperor under his own inspection.

According to an old custom, the youths of the imperial family, with other noble children, ate their meals in the presence of their elder relations. Britannicus, when assisting at one of these banquets, was attended as usual by a taster, and some artifice became requisite to prevent any violation of the court fashion, and at the same time to avoid the suspicion which must have been excited by the death of both the prince and this officer. An unpoisoned drink, already tasted, was therefore handed to Britannicus, and when he complained that it was too hot, the poison was poured into it with cold water. The moment after he had swallowed the last drop, he lost the use of his limbs, breath, and utterance. All present were in consternation, and some quitted the room; but those who were better acquainted with the habits of the palace sat still and watched the emperor's countenance. With a careless air, he pronounced the prince's disease to be an attack of epilepsy with which, he said, Britannicus had been afflicted from infancy, and that he would speedily recover. The involuntary terror displayed by Agrippina and Octavia proved the ignorance of the crime: the former was a veteran in dissimulation; the latter, though ever years, had been taught to repress all outward signs of grief or of affection. After a short pause, the festivity was renewed.

Britannicus was buried on the very evening of his death; the funeral arrangements, which were but slender, having been provided beforehand. The pile was constructed in the Campus Martius, under a terrific storm of rain.
Suetonius adds to the other causes of hatred which Nero cherished against Britannicus, that he was jealous of the superior eloquence of his voice; and that Titus, who was educated by the same tutors, happening to sit next him at the fatal banquet, tasted the poisoned cup, and for a long time, without any sign of life, lay struggling between life and death (by marks on the forehead), introduced by Narsissus in order to inspect the forehead of the prince, predicted that Britannicus would never mount the throne, which, however, would certainly be ascended by Titus. Titus, after his accession, called to mind this circumstance, and as a testimony to his early friendship for Britannicus, erected a golden statue to his memory on the Palatine hill, and had a second (equestrian) statue carved in ivory, which was exhibited in the Circean processions. The potion, says Suetonius, made his eyes red, and he survived five hours. This process being far too slow to satisfy Nero, a mixture of greater strength was prepared, which killed a pig immediately. The funeral of Britannicus is placed on the day after his death by Suetonius, and Dion (lxi) records that his face, being discoloured by the poison, was covered with plaster by the order of Nero, but that the torrent of rain which fell during the ceremony washed off the plaster and revealed the crime.

The disastrous history of Britannicus has furnished the ground of many moral lessons, but one, which the French consider: among the chefs d'oeuvre of their dramas, but which to our taste abunds in the chief faults of their theatre. Its close adherence to history is greatly vaunted, and it is but justice to admit that it has embodied the principal events from 145 to 54 a.d. and that it may be tolerated on prescription, although the entire story is detached from the plot, and is introduced solely to listen to the complaints of her mistress; but what is to be said in defence of the creation of Junie—the boy and girl love between 145 and 54 a.d., the person of Britannicus? the unworthy passion of Nero? The poet himself informs us that Britannicus was the most elaborate of his tragedies, and that its success by no means answered his expectations. Junie too, he tells us, is Junia Calvina, described by Suetonius as having an age of about 15 when she was above the age prescribed for admission to the College of Vestals, and of whom little more is known than that she was alive in the reign of Vespasian.

La Harpe has criticised Britannicus at great length, and in order to proceed so favourably. Broder also, in his Remarks on the 13th book of Tacitus, states that Junie, whose Racine introduced on compulsion through the necessity of the theatre, is the sole drawback to the perfection of his tragedy; her manners, he adds with truth, are far more French than Roman.

BRITAIN. [BRETAGNE.]

BRITISH AMERICA. The territory comprehended under this name extyles from 41° to 78° N. lat., and from 52° to 107° W. long.

The S. boundary of British America is formed by the territory of the U.S. The frontier line is not satisfactorily defined at some points, and has long been a subject of disagreement between the two nations. The E. boundary line as claimed by England under authority of 1783 is objected to by the government of the U.S. on the ground that the provisions of that treaty were founded upon the assumption of physical facts which subsequent examination has shown to be erroneous. If the English government is right in its interpretation, then the S. boundary of its continental provinces is as follows:—

Entering the riv. St. Croix in Passamaquoddy Bay, in 45° 10' N. lat. and 67° 15' W. long., it follows the course of the St. Croix to its source in 43° 48' N. lat.; proceeding thence in a line due N. for 41 m. to Mars Hill, it reaches the high land which separate the river, that empty themselves into the St. Lawrence from those which fall into the Atlantic. Taking thence a W. direction, the line proceeds with a somewhat irregular course along those high lands to the S.E. of Bangor. From this point to 44° 35' W. it follows a more direct line to the S.W. of Bangor, and thence continues W. in a right line until it strikes the St. Lawrence at the vil. of St. Regis, which stands at the W. extremity of Lake St. Francis. The line then proceeds in a S.W. direction through the middle of the St. Lawrence into Lake Ontario, which it divides into two nearly equal portions, leaves Ontario by the riv. Niagara and bisects Lake Erie; passes N. through the riv. Detroit into and through the lake and riv. St. Clair; enters Lake Huron at its S. point and quits it at its N.W. extremity; runs through 'the Narrows' and to the W. of the isl. of St. Joseph into Lake Superior, which it crosses with a winding course, leaving Isle Royale within the U.S. limits, by way of the S.W. of Lake of the Woods, and then runs N.W. to the N.W. angle of the Lake of the Woods in 49° 0' N. lat., and 94° 25' W. long.; proceeds thence due W. to the highest ridge of the Rocky Mountains, continues S. along that range to 42° 59' N. lat., and then takes a course due W. to the Pacific Ocean. The treaty of 1818, it was provided that the country in question should remain free and open to the vessels, citizens, and subjects of both the two powers for the term of ten years from that time, without affecting thereby the claims which either party might have to any portion of such country. The term thus specified has expired, but no such claim has hitherto been made to the settlement of the question.

A portion of the N.W. coast of America bordering on the North Pacific Ocean is claimed by Russia. This portion extends from 41° N. lat. to the shores of the Arctic Sea, and the N.W. of the Mexican territory.

The settled provinces of North America belonging to Great Britain are Lower Canada, lying between 44° and 50° N. lat. and between 64° and 76° W. long.; Upper Canada, 41° and 49° do. and 74° and 83° do.; New Brunswick, 45° and 48° do. and 65° and 67° do.; Prince Edward's Island, 46° and 47° do. and 62° and 65° do.; Newfoundland, 46° and 56° do. and 50° and 60° do. [CANADA, UPPER AND LOWER; NEW BRUNSWICK; NOVA SCOTIA; PRINCE EDWARD'S ISLAND, NEWFOUNDLAND; NORTH-WEST TERRITORY; HUDSON'S BAY.]

BRITISH CHANNEL. [ENGLISH CHANNEL.]

BRITISH MUSEUM. Till the middle of the 18th century the project of establishing a national Museum had often been entertained in England, but was opposed by the will of Sir Hans Sloane, who, during a long period of eminent practice in physic, had accumulated, in addition to a numerous library of books and MSS., a large collection of objects of natural history and works of art; these he directed should be offered for the benefit of the nation to the British Parliament for the sum of 20,000l., the collection having cost him 50,000l. The offer was accepted, and before the end of the year an Act passed which ordered the payment of the required sum, and vested the property in the museum. For the first time, an Act of Parliament sanctioned by an Act of the 12th and 13th of William III., should, with the library of Major Arthur Edwards attached to it, form a part of the general collection.

These several collections were ordered to be kept in their then respective places of deposit, till a more convenient repository, more durable and more safe from fire, and nearer to the chief places of public resort, could be provided for the reception of the whole.

To deprive the expenses of these purchases, to procure a repository for the museum, and to provide a fund for the permanent support of the establishment when formed, the Act directed that 100,000l. should be raised, by way of lottery, the net produce of which, together with the several collections, was to be vested in an incorporated body of persons, selected from the first characters in the kingdom for rank, station, and literary attainments, upon whom it conferred ample powers for the disposal, preservation,
tion, and management of the institution, which it was de-
termined should bear the name of the British Museum.
This was the first contribution made to the British Museum, in the
order of that Monarch.
It is impossible to enumerate in detail all the additions
which have been since made by gift or purchase. Dr. Thomas
Birch's library; two collections of books on musical
science from Sir John Hawkins, and one from Dr. Charles
Burney; the Muscovy Company's collection; several num-
rous classics from the library of Thomas Tyrwhitt, Esq.,
with his MS. notes; Sir William Musgrave's unrivalled
collection of bibliography; a collection of classics, enriched by
Dr. Bentley's MS. notes; a library of caramollas, process-
ions, and berries from Dr. Sarah Banke; and
a collection of Italian history and topography, from Sir
Richard Colt Hoare, are among the smaller acquisitions:
the valuable library of the Rev. Clayton Mordaunt Crahs-
ode; the law library of Francis Hargrave, Esq., the
library of Memoirs from the archives of the British and
the libraries of Mons. Ginguet, author of the 'Histoire
Litteraire d'Italie'; and of the Rev. Dr. Charles Burney,
and Sir Joseph Banks's library of natural history, are
among the larger.
Four separate collections of tracts, illustrating the
Revolutionary History of France, published at different
times by the trustees: one was the collection formed by
the last president of the parliament of Britain at
the commencement of the revolution; two others extended
generally through the revolutionary period; the fourth was a
collection of pamphlets issued in the last days of 1815: the whole
forming a library of revolutionary history as complete for France as the tracts already
mentioned of the time of Charles I. are for the civil wars of
England.

Another, and an unrivalled feature of the mu-
seum, was the library of the late Sir Harris, presented
by him, as the first in 1866. Sir Harris had formed a
great collection for his day. To these, in 1818, were added
the Burney collection, purchased at the estimated value of
1000L. Since that time the commissioners of stamps have
sold a large portion of this collection, and enabled the museum to purchase a large number of
newspapers deposited by the publishers in their office.

In 1833 the library of King George III. was pre-

presented by his successor to the British nation, and by
Parliament ordered to be added to the library of the British
Museum; but far greater has been the gain separated from the other
books. This library contains a collection of the works of
the greatest masters of all periods, and is in itself, perhaps, the most complete library of its extent that was ever formed.

The aggregate of the collections here enumerated, aug-
mented yearly by gifts, by claims under the Copyright Act,
and by grants of money from Parliament, have now placed
the department of printed books in the British Museum
upon a range with the greatest libraries of Continental
Europe; near 200,000, is now expended annually in the pur-
blishing of old and foreign publications.

The department of manuscripts, consisting of the Herculaneum, Sloane and Cottonian MSS., forms the nucleus of this depart-
ment at the establishment of the Museum: followed, in
1757, by the MSS. of the ancient royal library of England.
In this last collection, which contains whatever had been
brought together by our kings, from King Richard II. to
King George II., are numerous valuable MSS.: among them the 'Codex Alexandrinus,' in four quarto volumes, written
upon fine vellum, probably the most ancient MS. of the Greek
Bible now extant, in uncial characters, supposed to have been
produced in the fourth century. Further down the series, we have, also, present from Cyril, the patriarch of Constantinople, to King
Charles I. Many of these MSS. came into the royal
library at the time when our monastic institutions were
destroyed, and some still retain the anathemas upon their
pages. A list of the donors of this department, and the
names which have been prefixed to the books, have been
published by the British Museum, and is to be found in the
books of the Library Department.

The department of maps and prints was opened in
1753, and has since been rapidly increased. It contains
maps of all the principal countries of the world, from ancient
and modern times, and prints of all kinds, from the earliest of
their original deposit. Old scholastic divinity abounds in
this collection, and it possesses innumerable volumes, en-
riched by the finest illuminators of different countries, in a
succession of periods to the 16th century. Here also are preserved a numerous assemblage of the domestic music-books of Henry VIII.; and the Basilion Donor of King James I., in his own hand-writing. The Cottonian collection is especially rich in historical documents, from the time of the Saxons to King James I.; it likewise contains numerous volumes of Breton, Manx, and Cornish, as well as the charters of King Edgar and King Henry I. to Hyde Abbey, near Winchester, written in gold letters; and the MS., called the "Durham Book," a copy of the Latin Gospels, with an interlinear Saxon gloss, written about the year 800, illuminated in the most splendid and elaborate style of the Anglo-Saxons, and believed once to have belonged to the Venerable Bede. This collection is also singularly rich in royal and other original letters, and comprises the correspondence of most of the greatest personages not only of this country but throughout Europe during the earliest period in which letters were written to the seventeenth century. The Harleian collection is still more miscellaneous, though historical literature in all its branches forms one of its chief features. It possesses two very early copies of the Latin Gospels, written in gold letters. It is particularly rich in heraldic and genealogical MSS., in the Visitation of counties, and in topographical collections for almost every part of England; in parliamentary and law proceedings; in originals, copies, and calendars of ancient records, and other documentary MSS., among which is one of the earliest known of the Odyssey of Homer; in missals, Antiphonals, and other service-books of the Roman church; and in old English poetry. It likewise contains a large number of splendidly illuminated MSS., and an这方面 are the Slavonic MSS., principally consisting of MSS. on natural history, voyages and travels, upon the arts, and especially upon medicine. It comprises the chief of the celebrated Kempter's MSS., with the voluminous medical collections of Sir Theodore Mayer, concerning the diseases and their cure, in his famous "Regimenti of England from 1611 to 1642. It also contains a collection of medical and other scientific correspondence, with numerous MSS. on history, poetry, and miscellaneous subjects. Some of the drawings of animals belonging to this collection are among the most beautiful and most significant figures or figures upon vellum are from the pencil of Madame Marot; one relates entirely to the insects of Surinam.

The collection of MSS., formed by the first marquess of Lansdowne, was added to these libraries in 1807, having been purchased by an Act of Parliament for £4,000. The MS. of the Burghley and Caxton papers, supplementary to the Cottonian collection; in a very large assemblage of bishop Kenyon's MSS., and in numerous collections of an in-textual kind. Among the single volumes which may be enumerated are a number of the ms. of the Englishman's Bible, as well as a copy of the 1611, the most complete and most beautiful copies of the Bible, of which is a reproduction of the Bible, which is the most complete and most beautiful copies of the Bible, of which is a reproduction of the Bible, which is the most complete and most beautiful copies of the Bible, of which is a reproduction of the Bible, which is the most complete and most beautiful copies of the Bible, of which is a reproduction of the Bible, which is the most complete and most complete and most beautiful copies of the Bible, of which is a reproduction of the Bible, which is the most complete and most beautiful copies of the Bibl
Teas, in 1769, purchased a collection of well-preserved stuffed birds which had been brought over from Holland, for 450L.; many additions were afterwards made by purchases and donations. The group early in the reign of George III. brought numerous acquisitions; and in 1816 a rich collection of British zoology, which had belonged to Coll. Montague, of Knowle in Devonshire (including a very large number of birds), was purchased for 1100L. Since that date the collection has been augmented, and, in aggregate, forms a collection, not indeed complete, but as extensive as most of the collections in Europe. A valuable collection of stuffed birds has recently been bequeathed to the Museum by the late Major General Hardwicke.

In regard to the second condition of the will, it is to be observed that the specimens of minerals of Sir Hans Sloane's Museum were collected at a period when the science of mineralogy may be said to have scarcely existed. Most of them had been chosen for him by persons of little skill, or had been gathered in the course of discovery early in the time of the above-obscure. Mr. Gustavus Brande's collection of Hampshire fossils was added in 1763; and a third small collection, made on the N.W. coast of America by Mr. Menzies, who accompanied Capt. Vancouver as a naturalist, was presented to the Museum for a small sum.

This collection contained little that was particularly curious, except that it supplied a kind of geological history of an extensive but little explored coast. A systematic collection of minerals for the benefit of persons pursuing the study of that science was attempted in 1709, when they supplied the deficiency in that branch of their Institution by acquiring, at the price of 700L., a well-chosen collection of minerals of every class, consisting of 7000 specimens, which had been made by Charles Hatchett, Esq., during his residence in the East Indies. All the abovevaluable of the Sloanean collection was incorporated with this ample accession, and with the addition of what the Rev. C. M. Cracherode's bequest afterwards supplied, formed, even before the addition of the Greville minerals, a copious and useful mineralogical collection. In 1810 an opportunity presented itself of acquiring the extensive collection of minerals formed by Coll. Greville, which were purchased by vote of parliament for 13,727L.; in 1815 the British Government purchased from them, by tender, the large and splendid collection of minerals from the Harz Mountains, formerly preserved in the Observatory at Richmond.

Round the side of a portion of the Long Gallery which now contains the minerals, King George III. laid a series of arrangements in upright cases. In Saurian fossils the Museum is eminently rich, as well as in gigantic ossaceous remains, and in impressions of vegetables, fruits, and fish. Some of these acquisitions have been obtained at recent times.

Two of the greatest rarities of the mineralogical collection are the sculptured tortoise in the centre of the gallery, brought in Nephrite stone, and found on the banks of the Junna, near Allahabad, in Hindostan; and a large specimen of cellular lathyric iron from the province of Atacama in Peru.

The collection of minerals is daily increasing, and is at this time superior to any in Europe.

The system adopted for its arrangement, with occasional alternation, that of the Provinces, founded upon the electro-chemical theory and the doctrine of definite proportions as developed by him in a memoir read before the Royal Academy of Sciences at Stockholm in 1824. The detail of the arrangement is supplied by the running titles on the outsides of the glass cases, and by the labels within them. The ornithological portion of the natural history is arranged according to Temminck, and his generic names are in general adopted, with the specific names of Linnaeus and the diagnoses of Latham. The names of domestic animals and birds are included in this, as well as in other cases; and in this list of the general museum collection, are attached to specimens which have been presented.

The amphibia, crustacea, reptiles in spirits, sea-eggs, and star-fish, with the general collection of fish and sea-creatures, form a separate division of the natural history: the principal collections of crustacea and spiders are preserved in proper cabinets in a separate room.

The shells of the Museum, the collection of which has greatly increased since the death of Sir Hans Sloane, form another division of the natural history of no small extent; they are in numerous instances accompanied by clay models of the different molluscous animals. They are arranged in classes, order, and genera, according to Lamarck's system, which has been adopted as the basis for general arrangement, occasionally interpolated with the genera of other authors where Lamarck has left lacunae.

The entomological branch of the department of natural history is still in its infancy, but of late years the greater portion of Sir Hans Sloane's insects having perished from length of time, or the insufficient methods then taken to preserve them. Purchases and donations also are continually swelling their number, and a large accession has been received from Mr. Morgan and a part of the bequest from General Hardwicke. A small but interesting collection of the insects of Sierra Leone has also been recently presented by the Rev. Mr. Morgan. The collection, exclusive of General Hardwicke's bequest, fills two large chests, and is an extension of the insects as that at Paris.

Department of Antiquities.—In the infancy of the Museum, the antiquities being few in number and of little value, were considered, with other artificial curiosities, as an appendage to the natural history: the coins, medals, and other objects forming the museum collection were at that time appended to the department of MSS.; and the prints and engravings to the library of printed books. In 1772 a very considerable assemblage of articles of Greek and Roman antiquity, comprising the ancient Roman wall-vases, had been purchased by Sir William Hamilton for 8400L., schedules of which were drawn up by D. Hancarell. The original building of the Museum was still spacious enough to contain all that was accumulated in every department; and the Antiquaries, wishing to acquire a number as to require an increase of the establishment. The arrival of the Egyptian monuments acquired by the capitation of Alexandria in 1801, which were ordered in the following year by King George III. to be placed in the Museum in the interior, caused the erection of an additional edifice, rendered still more indispensable by the purchase of the Townley Marbles in 1805. Accordingly, upon the completion of the building intended for the two collections, a new department was created, in which the collection of ancient art was placed; and a magnificent collection of ancient sculpture was at length opened for the inspection of strangers and the improvement of artists, an advantage which the students in the fine arts had never before enjoyed in this country. To this department the Hamilton Antiques and antiquities were transferred, together with the coins, medals, drawings, and engravings.

In 1814, a communication having been made by the Townley family that there still remained in their possession a very large collection of ancient bronze figures and utensils, of Greek, Roman, and Etruscan, coins, gems, and other objects, offered essentially to illustrate the sculptures purchased in 1805, the House of Commons granted in the session of parliament in that year the sum of 8200L. for the purchase.

In 1815 the Prince Regent, at an expense of less than 1000L., contributed towards the purchase, and ordered to be deposited in the Museum an extensive series of marble sculptures, the frieze of a temple, which had been dug up at Phigaleia in Arcadia, and are known, from Pausanias, to be the genuine productions of the earlier time of the school of Phidias. To this department, too, and to the collection of coins, is contributed the progress of the arts in this country, is the most important accession received by the Museum since its institution. It chiefly consists of the exquisite sculptures which once adorned the pelhine and frieze of the Temple of Minerva on the Acropolis. For the purchase of those parliament voted the sum of 35,000L.

In 1810 the Duke of Portland offered to deposit the Portland Vase in the British Museum (the property to remain with him, where it is still exhibited). No infactory of ancient Roman sculpture of any extent has been added to the galleries of sculpture since the arrival of the Elgin collection; but numerous marbles of the higher class have been purchased from time to time, which may be mentioned the bas-relief of Jupiter and Juno, that of Jupiter on the Acropolis, Burke's collection, the group of Mithras, bought of Mr. Standish; the Rondini Pawn; the Torsos of Venus, which was injured by the fire at Richmond House; a bas-relief of the Apotheosis of Homer, purchased for 1000L.; a Venus of the Capitoli, presented by his
present Majesty; and a collection of Persian marbles, presented in 1822 by Sir Gore Ouseley, forming a valuable addition to some which had been previously presented by the Earl of Aberdeen.

Next to those of the bronzes, chiefly belonging to the Hamilton and Townley collections, though numerous and in some instances large and fine, formed but a subordinate feature in the museum department of antiquities. In 1824 Mr. R. Payne Knight, a trustee, whose attainments in ancient literature and knowledge of the fine arts were known not only in this country but throughout Europe, besides marbles and other objects, bequeathed to the Museum a valuable and extensive series of ancient bronzes, 798 in number; less numerous and of smaller dimensions than most of those found in Pompeii and Herculaneum, but in beauty of workmanship and admirable state of preservation superior even to those in the museum of the king of Naples.

To this part of the collection, in 1833, the bronzes of Siria, purchased, by subscription, from the Chev. Bronsdon, were added, at the expense of 100G. In 1825 the trustees obtained a large collection of Babylonian antiquities.

Coins and Medals.—The foundation of this part of the collection was laid in the cabinets of Sir Robert Cotton and Sir Hans Sloane. More than 6000 ancient medals were purchased with the Hamilton collection in 1772. In 1792 a collection of coins and medals, estimated at the value of 600G., was bequeathed to the Museum by the Rev. Clayton Mordaunt Cracherode. In 1802 the trustees purchased the most complete series of Anglo-Saxon coins then known, which was in the cabinet of Mr. Daniel Tbidwell. In 1810 a series of the coins of England from the Conquest to the reign of George III., which had been made by Edward Roberts, Esq. of the Exchequer, for his son, was purchased for the sum of 4000 guineas, and about the same time a series of about 5000 gold and silver Greek coins from Col. de Bosset for 600G. In 1814 the Townley collection of Greek and Roman coins (particularly rich in Roman large and second brass) was added by vote of parliament, with a collection of Greek coins offered for sale by Capri in 1817. The cabinet of Dutch, French, and Russian medals was purchased in 1823.

Another considerable as well as choice collection of Greek coins was obtained at the time of the purchase of the Elgin Marbles. In 1818 Lady Banks presented all such coins and medals belonging to the extensive cabinet of Mrs. S. S. Banks as were not previously in the Museum, including a collection of foreign coins of vast extent. In 1824 Mr. R. Payne Knight bequeathed his Greek coins to the Museum, which, joined to the Greek coins already in the cabinets, made the Museum series of kings and cities superior even to that of the British Museum. In 1825 the cabinet of M. de Vigne and M. de Bourgel was purchased by parliament for 1800G., and in 1825 parliament purchased for the Museum, together with Mr. Rich's collection of MSS., a large assemblage of early Arabian, Persian, and Sasanian coins, of the estimated value of 1000G., and in the same year King George IV.'s diamond of great value. Others of smaller value, and medals which had been attached to the library of George III., rich in English, but more especially rich in the foreign series, particularly in German coins, in papal, Flemish, and Dutch medals, and in an almost unrivalled collection of medals of the illustrious men of Italy.

The last cabinet of great extent acquired is that of William Marsden, Esq., consisting entirely of Oriental coins, divided into two portions: the first includes not only the coins belonging to the great empire of the Khaleef, but those of Persia, which share in the responsibility of forming the currency of the W. regions of Asia, and of the Mohammedan kingdoms and states formerly or at present existing in Africa and Europe; the second portion belongs to the countries of the East, and contains, including the coins of Persia, India, and China, together with those of the Indo-Chinese peninsula and of the islands geographically connected with them as far as Japan. This splendid collection was presented to the Museum, in addition to a further portion, by Mr. Marsden in 1829.

The generosity of individuals, and the exertions of the trustees as opportunities present themselves, are continually bringing acquisitions of a minor kind to this branch of the department of antiquities. Instances of the former may be mentioned of coins of the greatest value, found at Dorking in Surrey in 1818, given by Robert Barclay, Esq. of Bury Hill, and George Dewdney, Esq. of Dorking, chiefly by the former gentleman; and in a large collection of the coins of the two first Edwards, found at Tutbury in Staffordshire in June, 1831, presented by Lord Holland, chancellor of the duchy of Lancaster. Among the acquisitions of the trustees by casual purchase may be enumerated a selection from 5700 pennies of Henry II., purchased in 1803; a collection of the coins of Weir, in London, of all the various towns and mint masters of which were purchased for the Museum; and in a large accession to the already numerous coins of Canute found at Halton Moor near Lancaster, purchased in 1815. Eight hundred pounds were expended in purchases to supply deficiencies of every kind at the sale of the coins of Marmaduke Trattle, Esq. and in 1833, 1000G. were expended in the purchase of coins in gold, silver, and brass, chiefly Greek, selected from the cabinet of Mr. Borel. Two hundred and ninety-six staves of Ecbelene, Eanaed, and Enred, kings of Northumbria, and of Vignaud and Eanbald, archbishops of York, found at Hexham in 1832, were purchased in the same year; with no fewer than 659 varieties of pennies of King William the Conqueror found at Beaworth in Hampshire. A consideration of these collections and the work of new finds has also been recently purchased of Lieutenant Burnes.

Engraved gems, principally from the collections of Sir William Hamilton, Charles Townley, Esq., the Rev. C. M. Cracherode, and R. P. Knight, Esq., the department of antiquities is especially rich, as well as in antique pastels and in specimens of antique glass. In necklaces, ear-rings, armillae, and other trinkets of gold, this department is also rich. The latest acquisition of this kind is the gold breastplate, supposed to have belonged to a British chieftain, last found on the island of Thanet. In the division which contains drawings and engravings there are one or two superb drawings by Rubens: a large collection of drawings of the Italian school: three volumes, a part of Mr. R. P. Knight's bequest, containing 272 ori- ginal drawings of the Florentine school; a two-volume facsimile of drawings of the Dutch school: several hundred drawings by Albert Durer and other old German masters; a large collection of Van Huyen's drawings of plants, which formerly belonged to the Sloane collection; a collection of prints of the Grand Tour: a fine collection of prints of China: Parr's and Revett's views in Greece and Asia Minor, chiefly architectural, in two volumes, accompanied by a third volume containing Towne's views in Rome and its vicinity; three volumes of high value, the best engravings in black chalk, copied from the most celebrated pictures in Rome, and accompanied by an extra volume after the frescos of Guido in the private chapel of the Vatican, by Mosman: these were presented to the Museum by the Earl of Exeter; and two volume sets of drawings of antique marbles, gems, &c., formerly belonging to Mr. Charles Townley; and two folios of drawings made under the direction of the Earl of Elgin at Athens.

The collection of prints, among numerous impressions of works of Niello, is a sulphur of the celebrated Pax by Maso Finiguerra, of the Assumption of the Virgin, anno 1432, purchased in 1835 for 270 guineas. The prints of the different masters are for the most part arranged in schools, as the Florentine school, the schools of Sienna, the Roman school, the Bolognese, Lombard, and Venetian schools, the schools of Genoa and Naples, the French school, &c. There are large and almost complete collections of the works of Marc Antonio, Bonasoni, Rembrandts, and Pollard: a very large collection of early German prints in wood; an almost perfect collection of prints engraved after the pictures of Sir Joshua Reynolds: a large collection of Bartolozzi's engravings: Dr. Burney's collection of theatrical portraits: an immense collection of foreign portraits, purchased with the library of the Baron de Moil of Munich: and a Pennant's collection of prints of foreign scenes, purchased after the prints of Sir Joshua Reynolds: and fourteen volumes in folio of the largest size, made by the late Mr. Crole at an expense of 700L., by whom it was bequeathed to the Museum.

In the print room also is preserved one of the most wonderful specimens of the art, in a carving in bone by Albert Durer in alto-rilievo, representing the birth of St. John Baptist, dated 1510, for which Mr. Knight, who bequeathed it to the Museum, gave 500L.

From 1862, when the monuments taken from the Pyrenæ
at Alexandria arrived, till 1817, no material additions were made to the Egyptian part of the antiquities department; but in that year the upper part of a fine colossal statue, common with those incorporated called the Memnon, was brought from Thebes by Belzoni, was given to the Museum in the joint names of Henry Salt, Esq., the British consul at Alexandria, and Louis Burchhardt, Esq. In 1823 the trustees, by the aid of parliament, obtained Mr. Salt's first collection of Egyptian antiquities, which consisted of six cabinets, containing upwards of 2,000 species, the materials in process of arrangement being estimated to contain 5,000 more. This herbarium is, in addition to Sir Joseph's own collections upon his voyage with Captain Cook, the herbarium of Clifford and Hermann. Anbet, Miller, and Jourdain, with many of the plants collected by Tournefort and described in his 'Coralliorum.' Anbet's plants were from French Guiana; the collections of Clifford and Hermann were those from which Linnaeus formed his Hortus Cliffortianus and Florae Herbarum; Clinton's Herbarium was that from which Gornovius formed his Flora Virginica. It comprises also the plants collected in the various voyages of discovery subsequent to Sir Joseph Banks's own, with the contributions of numerous travellers, and a collection of plants sent by Loureiro from Cochín-China. The Bankian collection alone formed at the same time the most valuable assemblage of dried plants in Europe, and is still one of the most important, not only on account of its extent, but as containing the original and authentic specimens of many published species. There are but few public collections in Europe at present of any claim to extensive or even of moderate extent. The greatest of these, namely, that of the Jardin du Roi at Paris, contains perhaps a considerably greater number of species; while the public collection at Berlin, the next to that at Paris, is judged to be hardly superior to the Bankian. A collection of flowers and fruits, chiefly of the more rare or succulent plants, preserved in spirits, also form a part of the Bankian department, to the amount of upwards of 300 bottles; with a collection of seeds and fruits in a dried state. Since the arrival of Sir Joseph Banks's expedition from New South Wales, a collection of plants given by the East India Company, formed and distributed by Dr. Wallis, and another collection, of Egyptian plants, has been presented by J. G. Wilkinson, Esq. Other less extensive additions have been made partly by donation and partly by purchase.

The government of the Museum is vested under the act of parliament 25 Geo. II., and two or three other acts, in 45 trustees, including 23 official trustees, nine family trustees, one royal trustee, and 15 trustees who are elected by the Society of Antiquaries. The royal trustee is her Majesty the Queen; the lord chancellor, the speaker of the House of Commons, the lord president of the council, the first lord of the treasury, the lord privy seal, the first lord of the admiralty, the lord steward, the lord chamberlain, the three principal secretaries of state, in his leave, the lord president of the Exchequer, the lord chief justice of the King's Bench, the master of the rolls, the lord chief justice of the Common Pleas, the attorney-general, the solicitor-general, the president of the Royal Society, the president of the Society of Antiquaries, and the president of the Royal Academy. Of the family trustees, two represent the Sloane, two the Cottonian, two the Harleian, one the Townley, one the Elgin, and one the Knight families, by whom they are respectively appointed. The royal trustee is the duke of Northumberland; the six official trustees, Sir Henry Erskine, the third baronet, Sir John Heron, Bt., Sir Robert Hope, Bt., Sir Henry Brounker, Bt., Sir John Pringle, Bt., and Sir William Heneage, Bt.; the six family trustees, the duke of Devonshire, the Duke of Grafton, the earl of Oxford, the earl of Charleton, the earl of Suffolk, and the earl of Huntingdon; and the six other trustees, representatives of the trustees of the Sloanean, Cottonian, and Harleian families for being provided for by the act of 26 George II. Those of the Townley, Elgin, and Knight families are nominated under the respective acts by which the collections they represent were acquired. The appointment of the presidents of the Society of Antiquaries and the Royal Academy, as official trustees, passed 5 George IV. That for the nomination of a royal trustee (who, in the first instance, was the duke of Gloucester) passed 2 William IV. This act also provides that on the death of any of the principal librarians, who is also expeditor; six under librarians; six assistant librarians, and three extra assistant librarians, the name of librarian being given to the officers of all the departments; a secretary, and an accountant. Several permanent librarians of the Society of Antiquaries are also librarians. There are also attendants in the several departments, a clerk of the works, housekeepers, &c. The patronage of the Museum, that is, the appointment
to vacant offices, is vested in the three principal trustees only, the archbishop of Canterbury, the lord chancellor, and the speaker of the House of Commons, except in the appointment of the principal librarian, when two persons are presented by the Queen, and one by the House of Commons, to fill the office, and his Majesty makes choice of one of them.

The following are the regulations under which the Museum is maintained at the present moment for public use. It is open for general inspection every Monday, Wednesday, and Saturday, from half past ten o'clock every day except in the Christmas, Easter, and Whit week, and during the month of September, and on four single holidays, Tuesdays and Thursdays in every week are devoted to artists and other students in the different departments, and a third day is appointed for the days, who are not likely to disturb them. Foreigners and artists are also admitted during the month of September.

The reading room of the Museum is open from ten till four every day except on Sundays, and except for one week at Christmas, Easter, and Whitsuntide respectively, and on the four single holidays also mentioned. Persons desirous of admission send their applications to the principal librarian, or, in his absence, to the senior under librarian, who either admits them immediately, or lays their applications before the next general meeting or committee of trustees. The appointments are made by the trustees upon the recommendation of the principal librarian, or one of the officers of the house. Permission is then granted for six months, always renewable from time to time at the expiration of each term. No tracings from books or MSS. are allowed to be made without particular permission; and the entire MS. can be transcribed without leave from the trustees.

The following are the catalogues and descriptions of the different departments of the British Museum already published:

Catalogues of the additions to the printed books and MSS. to the latest time are kept in the Museum reading-room. There is also a separate MS. catalogue of the great collection of tracts relating to the civil wars of Charles I.; a separate catalogue of the Cole MSS.; and copies of the catalogue, privately printed by order of the House of Commons, of all the tracts, periodicals, and miscellaneous tracts in all languages, with more than 8000 books of reference, are constantly open for the use of students in the reading-room and in the case which surrounds them.

In the spring of 1824 Lord Liverpool announced that the Angerstein Gallery had been purchased by the government for £5,000; and it appears to be the opinion of the House of Commons, expressed in their debates, that the gallery should be opened to public inspection at the earliest possible moment. To the pictures would be most accessible, the trustees of the Museum made no hesitation in allowing the transfer of Sir George Beaumont's pictures to the same destination, but without relinquishing their trust; a certain number of trustees of the British Museum are, in consequence, trustees of the National Gallery, thus retaining their property in the pictures as well as a joint exercise of superintendence. In 1831 the Rev. W. A. Carr bequeathed another collection of pictures to the trustees, with a distinct direction that they should be hung in the same building with Mr. Angerstein's and Sir George Beaumont's pictures, and that the pictures of merit have been occasionally forwarded by the trustees to the same repository; as, in 1826, Sir Joshua Reynolds's picture of the Captive Lord, presented to them by the Rev. William Long; and, in 1837, a landscape by Gainsborough, presented by Lord Farnborough, and the Banishment of Cleobrotes by Leonidas by Mr. West, presented by William Wilkins, Esq.

BRITTOWN. We have, under 'BRACTON,' enumerated all the principal writings of those early English lawyers and jurists who, by the grace of God, have continued to produce a recommendation satisfactory to a trustee or an officer of the house. Permission is then granted for six months, always renewable from time to time at the expiration of each term. No tracings from books or MSS. are allowed to be made without particular permission; and the entire MS. can be transcribed without leave from the trustees.

We have seen that there is doubt who Bracton was. There is still more doubt respecting Britton, whose existence as an individual person has even been doubted. Selden, who on such points is a high authority, in his notes upon Fleta, contends that 'Britton' is nothing more than a shortening of 'Bracton,' and that to the same hand to be ascribed as to the compiler of the 'Digest,' in which the name of Britton occurs also the French treatise known by the name of 'Britton.' This was Selden's later opinion; for in an earlier work he has spoken of them as two distinct writers. John Le Breton, bishop of Hereford, who died in the third year of Edward I., has been supposed to be the author (Tanner, 'Bibliotheca,' p. 119). Others attribute it to a John Breton, who was a judge in the first year of Edward II. There seems no reason to doubt that the work was composed in the reign of King Edward I.

Britton to the name, one may point in the practice of the common law, in 126 chapters.

The high esteem in which the work was held, is evidenced by the numerous manuscripts of it which still exist in our great libraries. In the British Museum are several of great value.

It was first printed in 1540 by Redman, who had meditated doing so before; for he tells us in the preface that 'he had of long time a fervent zeal and inward affection to imprint the fountain (as who should) or well of the same Learnings, from whence those old judges in the time of King Edward the First and since, have sucked their reasons and grounded their learnings.' A century later, namely in 1640, there was another edition published by Wingate, a lawyer. These are the only editions which have appeared in England. Britton is contained in the edition of the early writers on Scotch law by M. Howard, in two volumes, in which the volumes, a noble undertaking, intended to promote in France the study of comparative jurisprudence.

There still remains however the very necessary work to be performed of a collation of the existing manuscripts. It is a work both important and useful. It is to be thought that the value of the work lies in the fact that it is a work of value in any department of literature, which was published by the early printers, who seldom did more than follow some one manuscript which happened to have fallen into their hands, and which might not always happen to be the better part of the manuscript. It is a work which would prepare such an edition, and a specimen of the intended work may be seen in Cooper on the Public Records, 1829, vol. ii. p. 403-413; the text being taken from what is perhaps the best manuscript (Harleian, 394), and the margin presenting the various readings found in many other manuscripts.
In 1762, a translation of Britton, as far as the 25th chapter, was published by Mr. Robert Kelham; but the work did not receive much encouragement. He translated the remaining portions, but the manuscript remained in his hands till 1807, when being then the senior member of his profession, he deposited the volume unprinted in the library of that society, where it now remains.

BRIYE, or BRIVES LA GAILLARDE, a town in France, capital of an arrond. in the dep. of Corrèze, on the road from Paris to Montauban and Toulouse; 299 m. S. or S. W. of Paris; in 51° 29' N. lat. and 1° 39' E. long.

It appears to have been a place of some importance in the ages succeeding the downfall of the Roman empire, for here, in the latter part of the sixth century, Gondebau, an illegitimate branch of the Merovingian kings of the Franks, caucus the title of king; in 1015 it was captured by the emperor Henry IV., and latterly situated opposite to an island in the riv. Corrèze, over which are two bridges; and is superior in situation to most of the towns of the dep. The valley in which it stands is bounded by hills crowned with vines and chestnut trees: the pleasantness of the site has given to the town the surname of La Gaillarde, 'the gay.' Briey is enveloped by a pleasant walk planted with elm trees and skirted with good stone houses; but in the interior we do not meet either with handsom streets or good squares. It had before the Revolution a collegiate church, and is in possession of considerable churches, six religious communities, and a good college. The manufactures are chiefly of large copper utensils and silk and cotton goods; and these, with chestnuts, nut-oil, wine, brandy, wax, and some articles of trade, the quantity of cattle are reared in the neighbourhoood for the Paris market, and many pigs for Bordeaux and the south of France. Slate and antimony are obtained at no great distance. The pop. in 1832 amounted to 5576 for S. V., 5247 for N. V., or 10,821 for the whole commune. There is a high school, a public library, an agricultural society, and an hospital.

The arrond. of Briey had, in 1832, 111,024 inh. In a valley two or three miles S. of Briey are several apartments excavated in a rock and pierced with doors and windows; there are three of them. They are probably formed as a place of refuge from the ravages of war, but the presenty ascribe to them a marvellous origin.

BRIXEN, in the Austrian circle of the Pusterthal and Eisack, in the Tyrol, though a small town, was, before the French revolution, the capital of an independent bishopric, the possessions of which extended over a surface of nearly 360 sq. m., having a pop. of upwards of 25,000 souls. The town lies at the foot of the Brenner, and at the confluence of the Rienz and Eisack, in the bosom of a cheerful, fertile valley; it is the seat of a bishop, a rich and stricken appearance; the houses are in the Italian style, but ill-built, the streets are badly paved, and the number of inh. does not at present exceed 4000. It is still the residence of a bishop, and the palaces have been some times occupied by the Bishops of St. Julian, four other churches, and the town-hall, are the principal edifices in the place. It has a gymnasium, an episcopal seminary with a theological school attached to it, a Capuchin monastery, a female school conducted by the nuns of the English sisterhood, and a convent of the Tertian nuns. The principal mountains are surrounded with vineyards which produce a very palatable red wine, in which the chief trade of Brixen consists. 46° 40' N. lat. 11° 47' E. long.

BRIXHAM, DEVON, a sea-port, m. t. and par., in the par. of Hayer and co. of Devon, 22 m. S. from Exeter, 165 W.S.W. from London, and in 51° 25' N. lat. and 3° 32' W. long. The area of the par. is 5210 English statute acres.

The manor of Brixham formerly belonged to the Wovants, and from this it passed into the hands of the Valeort family, by whom it was sold, and it is now divided into quarters, some of which quarters are again subdivided, and the shareholders (many of them common fishermen) all call themselves quay lords. The har. consists of two basins; the outerly is about 100 ft. long, and expense of nearly 5300l. raised solely amongst the inh. There are about 120 vessels employed in the port from 60 to 150 tons burden, and 103 from 20 to 45 tons burden, and about 64 smaller boats, nearly all engaged in the fishing trade. The principal trade, besides the local, melancholy, and soles; they are sent in great quantities to the London, Bath, and Exeter markets. Brixham has a fair on Whit-Tuesday and the following day, and a market was esta-

lished in 1799, by authority of an act of parliament passed in that year.

The town is prettily situated on the S. side of Torbay, about a mile and a half S.W. from Berryhead, and directly facing the delightful watering-place Torquay, from which it is distant only 2 miles. It is a pleasant walk from the natural hamm. M. The part near the water is called Brixham Quay, or Lower Brixham, and is a miserable looking place; the houses irregularly built, the streets narrow and filthy, and the smell of tar and fish is intolerable. The upper town, called Church Town, is much more respectable. The town is, however, much better, and contains some good houses. The church is dedicated to the Virgin Mary; it has lately been enlarged by 800 sittings, of which 700 are free, the incorporated Society for the Enlargement of Churches having granted 700l. At Lower Brixham is a handsome tavern of the name of the 'Restitution.' The town is governed by the parliamentary commissioners. There are also places of worship for Baptists and Wesleyan Methodists.

The pop. of Brixham is 5013, of which 2110 are males and 2903 females: a great proportion of the males are employed in registered vessels.

A national school has been united with an old establishment endowed in 1634. The master has a house and garden and a salary of 60l. per annum: two school-rooms have lately been erected near the master's house, where 400 children of both sexes are taught. Brixham is granted 13l. per annum to this establishment 13l. per annum. Mr. John Kelland left by his will (dated 1709) a sum of 2000l. for the endow-

ing of charity schools and augmentation of small livings, and a hospital, the discretion of his trustees; in consequence of which John Toman, Esq., one of the king's justices, appropriated the sum of 490l. to the par. of Brixham, and purchased with it an estate at Ashburnham, now let at 42l. per annum, in aid of this school. Besides the land there is now about 700l. stock belonging to the school.

Brixham was the landing-place of the Prince of Orange, afterwards William III., on the 5th of November, 1688.

In the church is a cenotaph of Sir Francis Buller, the judge. In the neighbourhood of Brixham is Lupton, formerly in the possession of the ancient family of the Penfolds; it was then the seat of Lord J. B. Penfold, who, before the Revolution, was a Jacobite, and left it at his death in 1704. There is also a curiously well, called Lay Well, the water of which ebbs and flows about nine times in an hour.

(Sir William de la Pole's Description of Devon; Lysons' Magna Britannia: Pop. Reports; Correspondence, &c.)

BROADSTAIRS. [Kent.]

BROCHI, GIOVANNI Battista, was born at Bassano, in the Venetian teritory, in February, 1772. He studied in the college of his native town, and afterwards at the university of Padua, where he acquired a good knowledge of the profession of the law; but young Brocchi's chief attention was directed to botany and mineralogy, and when the time came for his examination previous to his taking his doctor's degree, he left Padua abruptly and went to Rome, where he became a great admirer of the works of Nardini, and with his assistance he became well versed in Roman and Greek archæology. He paid particular attention to the Egyptian antiquities at Rome, and he wrote some dissertations on Egyptian sculpture. Having returned to Bassano, he con-

cluded his studies of the natural sciences, and in 1802 was appointed professor of botany in the newly established Lyceum of Brescia. He was made secretary to the Athenæum or scientific academy of that city, and he was the first editor of the Memoirs of that institution. He also made extensive observations on the valleys of the Adige, the Adda, and the Ticino, and, having examined their geology and their mineral productions, he published Trattato mineralogico sulle Minerale di Ferro del Dipartimento del Mella, con l'Esposizione della Costituzione fisica delle Montagne metalifere della Val Trompia; 2 vols., 8vo., Brescia, 1807. In 1808 he was made inspector of the mines of the kingdom of Italy, and soon after he was chosen a member of the Italian Institute. The results of his geological and mineralogical observations, made during his frequent excursions in the provinces of Tuscany, Emilia, and the Abruzzi, were translated by Mr. Chichester into English, and published in the following works: 1. Memoria mineralogica sulle Val de Fassa nel Tirol,' Milano, 1811. 2. The valley of Fassa, in the Italian Tyrol, near Brixen, which is very rich in magnificent crystals. 3. Observations, &c., had not been examined before by any of the explorers of the Alpine regions. 2° Conchologia ferrata subapennina, con Osservazioni geologiche sugli Apennini e sul Suolo adiacente,' 2 v. 4º, Milano, 1814. This, the prin-
Brocchi, the result of his repeated visits to the central and S. parts of Italy. It begins by an
interesting description of the provinces, and of the
territory which they possess in Lombardy, and the
adjacent valleys and plains, which abound in organic
remains, that Brocchi's investigations were chiefly directed.
He examined the numerous varieties of shells found among
the rocks in one of the most remarkable and extensive
eons of Italy, and which form nearly one-half of the whole.
It should however be noticed that the rocks to which Brocchi
assigned the name subepipitum are not all precisely of the
same geological age, and that the amount of recent shells
detected in them is very small, while in most of the
zoons of Italy, the fossil shells were found in central and
southern Spain: parts of Italy, and which form nearly one-half of the whole.
3. Catalogo ragionato di una raccolta di rocce disposto
con ordine geografico per servire alla geognosia dell'Italia,
8vo. Milan, 1817. This work contains a catalogue of more
than 500 specimens of rocks collected by Brocchi in the
province of Lombardy, and in the republics of Venice, Genoa,
and Modena. It is preceded by a well-written introduction
on the geology and mineralogy of the different regions of Italy,
and is considered one of the most important works in
the field. It is published in various Nos. of the 'Biblioteca Italiana,'
between the years 1816-23. In 1820 Brocchi, after residing some time at Rome,
published 'De isto status fisico del suolo di Roma,
Memoria per servire a illustrazione alla carta geognostica
de la Città,' in which he made a thorough investigation
of the surface of the ground on which Rome, both antient and
modern, now stands; and, secondly, of the character of the soil,
the various rocks and strata of the hills and of the
valleys, and the topographical conditions of the Tiber.
He accompanies the work with a very correct idea of the physical
topography of Rome. Brocchi's observations are accurate
and valuable; but some of his inferences and hypotheses
have met with much opposition, especially those in the
latter part of the work, which consists of a 'Discorso
sui Materiali della Struttura del Territorio Romano.'
He argues that the air in antient times must have been more
unwholesome than it is at present, although he admits that the
country was much more populous and that the people
had other means of preparing the air by their dress and
their manner of living. Brocchi made some
curious experiments during four nights which he passed at
S. Lorenzo fuore delle mura, one of the most unwholesome
spots near Rome. He divided the number of persons who
left the town each night, and submitted them to a chemical analysis,
but all his trouble and risk led to no satisfactory result.
He gives a plain and straightforward account of his attempts at the end of the book.
In 1823 Brocchi sailed from Trieste for Egypt, a country which he had long wished to examine, especially with
regard to its mineralogy. He found favour with Mehemet Ali, who sent him on several missions, supplying him with
thorough information of his work. In 1826 he was directed to
the working of a coal mine, and afterwards to look for the
emerald mines of Mount Zabarah, which Mauclaura and Bel
zoni had visited some years before. Brocchi however found
only some loose pieces without their proper setting, but seeming
be part of the structure of the mine. He was taken ill however,
and died at Cartum in September of that year. His friend Acerbi, Austrian consul-general at Alexandria,
recovered his papers and collections, and forwarded them,
according to his will, to his native town, Bassano. His rich
collection of Italian minerals and fossils he had given to his
native town, and to the University of Bologna. 'De化石と, et moribundo. (Sacchi, Varietà letterarie, Necrologia di G. B. Brocchì.)
Brocchi had done more for the geology of Italy than any of
his predecessors.

Brockesby, B. 

Brockesby, RICHARD, the only son of Richard
Brocklesby, Esq., of Cork, was born at Minehead, in Somer
setshire, on the 11th of August, 1722. After receiving the
rudiments of education in his father's house at Cork, he
was sent to Ballitore school, in the N. of Ireland, where he
lived with his cousin, the Rev. John Deane, to whom he
owed the most cordial friendship when they again met in
London. He afterwards studied at Edinburgh, and then at
Leiden, where he took the degree of doctor of physic
under the celebrated Gauvain, in June, 1745, his inaugural
thesis being directed to the doctrine 'De saltu, and at Leiden.
Lugd. Bat., 1745. The following year he came to London,
and settled in Broad-street; and as the income allowed him
by his father was not large, and his professional gains were
at first small, he determined not to engage in the
strictest economy, 'never suffering himself,' he used to
say, 'to have a want that was not accommodable to his
fortune.' The same year he published 'An Essay concerning
the Mortality of the Horned Cattle,' 8vo., 1746, which
brought him a premium of 100l. which he purchased
himself a licentiate of the college of physicians in 1754, he
obtained the honorary degree of M.F. from the university
of Dublin, and being admitted ad eundem at Cambridge,
he was enabled to become a candidate, and in 1756, a fellow,
and in 1760, a professor of physical at Cambridge. He had
pointed physician to the army, and served in Germany during
most of the Seven Years' war, where he was distinguished
by his zeal, knowledge, and humanity; and particularly re
commended himself to the notice of the Duke of Richmond,
in Flanders. He published 'A Treatise on Inflammables
and Explosions in War,' in 1768. He was one of the first
physicians to the hospitals for the British forces, and returned
to England before the peace of 1763. He then settled in
Norfolk-street, Strand, and soon reaped the reward which skill,
attention, and good humanity, in a proper time, could
realize. To this source of income were likewise added his half-pay,
and his paternal estate of 600l. per annum. Being unmarried he was enabled
to live in a very handsome style, and often entertained at
his dinner table such persons most distinguished for rank,
abilities, or learning, in the kingdom.

In 1763 Dr. Brocklesby was called in to attend Wilkes, who
was suffering from a wound in the abdomen received
in his duel with Mr. Martin; and it is thought that Wilkes's
natural recovery gave a great impulse to his physician's rising
reputation.

Dr. Brocklesby preserved in politics the same judicious
moderation which was his general characteristic; for though
he was a member of the Constitutional club, and a warm
advocate of the cause of the Middlesex petitioners, he
never forgot the respect due to the laws, and quitted the club as soon as it deviated into
other doctrines, under other leaders.

In spite of the placidity of his tempermant, he was once
a principal in a duel, his antagonist being Dr., afterwards
Sir John Elliott; but it must be confessed that this duel
was one of the most peaceable and sensible upon record—the
seconds having taken care to place the combatants at such
a distance from each other that the bullets, even if they
should hit, could not possibly do any mischief.

As Dr. Brocklesby's prudent frugality had preserved him
from embarrassment when poor, so it enabled him to
dwell in the most munificent charity when rich. He
had always a large number of almshouses, and three or four
charitable persons to whom he granted small annuities, and who on the quarter-days on which their
stipends became due partook of the hospitality of his table.
To such of his relations as required his assistance he was
to not only liberal, but so judicious as to prevent the
egregious vanity of their repetition. When the de
clining years of Dr. Johnson seemed to render travelling
advisable, Dr. Brocklesby offered him a life-annuity of 100l.
per annum; and on this being declined he made him an
other offer, in so many words, to subscribe in joint
with Mr. Edmund Burke a legacy of 1000l.; but recollecting that
the legatee's death might take place (as it really did) before
his own, he gave it to him in advance, ut pignus amicitiae,
and it was accepted as such by his illustrious friend.

No. 329.
In 1794 Dr. Brocklesby found the infirmities of age increase so fast upon him that he declined visiting patients, excepting a few of his private friends. He died the same day, and the same time gave up his half-pay. A little before this time his patron and friend the Duke of Richmond had made him physician-general to the royal regiment of artillery and corps of engineers.

The town, on the 11th of December, 1797, in his 79th year, having returned that day from a visit to the widow of Edmund Burke, at Beaconsfield. With the exception of a few legacies, he left his fortune, which is said to have exceeded 30,000l., between his two nephews, Mr. Roderick and Mr. John Brocklesby.

Dr. Brocklesby was a Fellow of the Royal Society, and wrote two papers in their Transactions:—' An Account of the Poisonous Root lately found mixed with Gentian' (No. 466); and 'Experiments on Cutting the Tendons in various Animals' (No. 467). Besides the latter, and the Dissertation before mentioned, he was the author of the following:—' Eulogium Medicum, sive Oratio Anniversaria Harveiana,' &c., 4to. 1760. 'Economical and Medical Observations from 1738 to 1763, tending to the Improvement of Medical Hospitals.' 2 vols. 1764. 'The state of the navy; its manner of being built and dirty: it contains 2006 houses (mostly of wood) and about 24,000 in., of whom above 5000 are Jews, on which account it has been nicknamed 'The German Jerusalem.' There are several squares and open spaces, the principal of which are King's Square, the Market-square, and the New-market. Besides three Greek churches and a Roman Catholic church, it possesses three synagogues, a convent of the Pious Sisterhood, a large palace belonging to the Potocki family, and other handsome buildings. It has two Jewish schools, all high school, and a school for affording instruction in such subjects as are connected with trade and manufactures, to which there are attached a benevolent fund for the support of indigent pupils, and an excellent cabinet in natural and experimental philosophy; a Roman Catholic grammar-school, and a hospital. It is, besides, annexed to the convent, a Jewish hospital, a Polish and a German theatre, and public baths. In a commercial point of view, Brody is the most important town in Galicia. The trade is almost exclusively in the hands of the Jews, and consists principally in the exportation of wool, tobacco, wax, tallow, silkgass, hides and skins, leather, anised, dried fruit, &c.; the import of jewels, pearls, colonial produce, and manufactured goods; and the transit of merchandise to Russia, Turkey, &c. There are tanneries and brickworks on the outskirts of the town, and the fair is well attended. About 50° 7' N. lat.; 22° 18' E. long.

BROEK, or BROECK, a vil. in that part of the prov. of N. Holland called Waterland, about 3 m. W. of the port of Monnikendam, and 23 m. N. of Amsterdam. Broek obtained the privilege of a town in 1163. It is a large, well-built town with one street, and cleanliness which it uniformly exhibits. The vil. is composed of lanes so narrow that no carriage can enter, and they are paved with small bricks, or chinks of various colors, disposed in the form of mosaic. The houses, many of which are of the gothic style, are well built, and the roofs of a small garden, laid out with formality, and stocked with flowering shrubs and the choicest flowers. The houses are all painted in different colors; the order and cleanliness of the streets, the neatness of the windows and doors, and the proper dress of the inhabitants are an index to their outward appearance. At the door of each house there is a saucer for the collection of money, which is given by every person who enters must substitute for his shoes: it is said that when the Emperors Napoleon and Alexander visited Broek they complied with this custom. Many workmen who come to the town to earn their bread are received at the door of any house, or at the Town Hall, without being asked for money. It is at times necessary to have money inherited from their fathers. Some of them add to their wealth by dealing in butter and cheese produced from the fine pastures in the neighborhood. The men seldom marry until they are near forty years of age, and until more than sixty they are in the service of the church, at thirty-five. They live very retired lives; the principal door of the house is never opened except on the occasions of baptisms, marriages, and funerals, the inh. ordinarily passing in and out of their dwellings by the back entrance.

BRODY, a town in the N.E. part of Galicia, lying in a woody place, and noted for forests of the E. and N.W. quarters. It is on the rivulet 'Sucha-mieka,' which flows N. to the Styry: it is on the high road from Lemberg to Dubna, in Russian Poland. In the year 1779 Brody was raised to the rank of a free town, and consequently it has its own magistrates. It is a large town, and five miles 4 f. W. of Warsaw. It contains 2006 houses (mostly of wood) and about 24,000 in., of whom above 5000 are Jews, on which account it has been nicknamed 'The German Jerusalem.' There are several squares and open spaces, the principal of which are King's Square, the Market-square, and the New-market. Besides three Greek churches and a Roman Catholic church, it possesses three synagogues, a convent of the Pious Sisterhood, a large palace belonging to the Potocki family, and other handsome buildings. It has two Jewish schools, all high school, and a school for affording instruction in such subjects as are connected with trade and manufactures, to which there are attached a benevolent fund for the support of indigent pupils, and an excellent cabinet in natural and experimental philosophy; a Roman Catholic grammar-school, and a hospital. It is, besides, annexed to the convent, a Jewish hospital, a Polish and a German theatre, and public baths. In a commercial point of view, Brody is the most important town in Galicia. The trade is almost exclusively in the hands of the Jews, and consists principally in the exportation of wool, tobacco, wax, tallow, silkgass, hides and skins, leather, anised, dried fruit, &c.; the import of jewels, pearls, colonial produce, and manufactured goods; and the transit of merchandise to Russia, Turkey, &c. There are tanneries and brickworks on the outskirts of the town, and the fair is well attended. About 50° 7' N. lat.; 22° 18' E. long.
tress, and, if still urged on, he drops and dies: this therefore is one of the worst species of unsoundness.

The cause of the rupture of the air-cells may be previous inflammation of the lungs, by which a portion of them has been rendered impervious, and thus greater labour thrown on the remaining parts. The result is, the injury of the diaphragm, of the larynx, probably weakened by the inflammation in which it had shared, yields to the unnatural distension to which they are thus exposed. Many a horse has become broken-winded when urged to extra exertions immediately after he has been fed; or the opposite, exactly the reverse. Into the lungs, the parts suddenly and forcibly inspired, and the full stomach lying against the diaphragm, with which the body of the lungs is in contact, their perfect expansion is prevented, and those parts of them, the edges, which are free from this pressure, are adducted, or compressed, and the expiration of expiration to which the horse is accustomed has much to do with this disease. If it is comparatively inoffensive, a greater bulk of it must be eaten, and the distended stomach will oftener and longer press upon the diaphragm and impede the dilatation of the lungs, or render it unequal in different parts. Thus broken-wind is a disease of the farmer's horse fed too much on hay or chaff; it is often produced in the straw-yard, where little more than the coarsest food is allowed: but it is comparatively seldom seen in the stable of the coach-proprietor, in which the food is of a better quality, and lies in a smaller compass, and is more regularly administered; and it never disregres the hunting or racing stable. It must however be confessed that there is sometimes an hereditary predisposition to this disease, consisting in a narrowness of chest or a breaking structure in the lungs.

There is no cure for broken-wind; no art can restore the dilated cells to their former dimensions, or build up again a wall between them. But palliative measures may be adopted to lessen the sale of breath, and make the horse more useful than he otherwise would be. Straw and chaff should be forbidden, the quantity of hay perhaps a little diminished, and that of corn correspondingly increased. A mash should constitute a part of the evening's feed, and the daily supply greatly diminished. The daily exercise should not be required when the stomach is full. Occasional or periodical fits of greater difficulty of breathing should be met by small bleedings and gentle laxatives. By this management not only will the broken-winded horse be rendered useful for many ordinary purposes, but he will be capable of service and labour, which it would otherwise be cruel to require of him.

BROKER, a person employed in the negotiation and arrangement of mercantile transactions between other parties. He is commonly employed in foreign trade by the shippers, either the buyer or the seller, but sometimes acting as the agent of both. As it usually happens that individual brokers apply themselves to negotiations for the purchase and sale of some particular article or class of articles, they are usually employed with an knowledge of the qualities and market value of the goods in which they deal, and obtain an acquaintance with the sellers and buyers as well as with the state of supply and demand, and are thus enabled to bring the dealers together and to negotiate between them on terms equitable for both. A merchant who trades in a great variety of goods and products drawn from different countries, and destined for the use of different classes, cannot have the same intimate knowledge for his guidance, and will consequently find it advisable to employ several brokers to assist him in making his purchases and sales.

Ship-brokers form an important class in all great mercantile ports. It is their business to procure goods on freight or a charter-party, and to negotiate with the shippers or consignees of the goods which they carry. In the principal ports of this kingdom almost all ship-brokers are insurance-brokers also, in which capacity they procure the names of the insurers, their policies of insurance, and settle with the latter the rate of premium and the various conditions under which they engage to take the risk, and receiving from them the amounts of their respective subscriptions in the event of loss. Should this loss be partial, it becomes the duty of the broker to arrange the proportions to be recovered from the underwriters. The business of an insurance-broker differs from that of other brokers in one particular. The latter, when they give up the name of the party for whom they act, incur no responsibility as to the fulfilment of the conditions of the contract, while an insurance-broker is liable in all cases to the full amount of the premiums for the amount of the loss. He does not, on the other hand, incur any liability to make good the amount insured to the owner of the ship or goods, who must look to the underwriter alone for indemnification in case of loss. Under these circumstances it is the duty of the insurance-broker to make a prudent selection of underwriters. Merchants frequently act as insurance-brokers.

Exchange-brokers negotiate the purchase and sale of bills of exchange drawn upon foreign countries, for which purpose they must have the required capital. They determine the exchange current between their own and every other country, and should keep themselves acquainted with circumstances by which those rates are liable to be raised or depressed; and they should besides acquire such a general knowledge of the transactions and credit of the merchants whose bags to buy, as may serve to keep their employers from incurring undue risks. Persons of this class are sometimes called bill-brokers, a title which is likewise given to another class whose business it is to employ the spare money of bankers and capitalists, and to manage that money in the change having some time to run before they will become due.

The business of a stock-broker is that of buying and selling, for the account of others, stock in the public funds, and shares in the joint stock companies. The regulated by which the proceedings of stock-brokers should in certain cases be regulated (7 Geo. II. c. 8, and 10 Geo. II. c. 8), have long been dead letters. Under these enactments every bargain or contract for the purchase or sale of any stock in the public funds, is void, if not entered into as a speculation upon the fluctuations of the market, is declared void, and all parties engaging in the same are liable to a penalty of 500l. for each transaction.

Every person desirous of acting as a broker for the purchase and sale of goods within the city of London must be licensed for that purpose by the lord mayor and court of aldermen. When admitted, the broker must give bond, conditioned with a penalty of 500l., for the faithful discharge of his duties, with regard to the customers and to the utmost of his skill and knowledge. He is sworn to this effect, and further binds himself not to deal in goods upon his own account—a stipulation which is very commonly broken. It is the indispensable duty of a broker to receive upon admission a bond, conditioned with a penalty of 500l., for his fidelity in receiving and restoring money for his principal, and for his fidelity in carrying on the business of the broker without having procured a license or paid the fees, is liable to a fine of 100l. for every bargain which he may negotiate.

It is usual to apply the name of broker to persons who buy and sell second-hand household furniture, although such an occupation does not bear any analogy to brokers as here described, furniture dealers buying and selling generally on their own account and not as agents for others. These persons do indeed sometimes supercede to their business the appraising of goods and the sale of them by public auction under warrants of distress for rent, for the performance of which functions they must provide themselves with an excise license, and they come under the regulations of an act of parliament (57 Geo. III. c. 93).

The business of a pawn-broker is different from that of the commercial brokers here described. [PAN.

BROMBERG, a government circle forming the northern half of the prov. of Posen, on the E. by the kingdom of Poland, of the prov.: N.E. by western Prussia, and containing an area of about 4490 sq. m., with a pop. of about 327,000, of whom about 200,000 are Roman Catholici, and 21,000 Jews. It contains nine minor circles, 54 towns, and 163 villages, besides 3120 colonies. It is a level country, fertile in parts, and full of forests. It is particularly in its eastern district between the Vistula and Netze. It produces most kinds of grain, potatoes, fruits and vegetables; much timber is felled, and considerable quantities of horses (in 1831 about 44,000), horned cattle (about 30,000),
BROMELIACEAE, a natural order of endogenous plants, taking its name from the genus to which the pine-apple was once incorrectly referred [Ananas], and consisting of herbaceous plants, remarkable for the hardness and beauty of their foliage and the abundance in the tropical parts of the world, or in such extra-tropical countries as, owing to local circumstances, have a climate of a tropical nature. Sometimes they are found growing on the earth in forests, but more commonly they spring up from the substratum of trees, round which they coil their simple, succulent roots, vegetating upon the decayed matter there they may find, and absorbing their food in a great measure from the atmosphere. Their leaves are usually long and narrow, so very long that they form a kind of cup in which water collects; so that the traveller who ascends the trees on which they grow, if he he ups one of these plants, as he easily may, is unexpectedly deluged by a shower, the source of which he would not have suspected. The most beautiful of them are perfectly smooth; but the fruit is in no case of any value except in the genus Ananas. Bromeliaceae may be shortly described as scurfy-leaved, hexadrous endogens, with distinct calyx and corolla, an inferior ovary, and seeds whose embryo lies in a small albumen. They are known from Amaryllidaceae by the latter circumstance, by their hard scurfy leaves, and epiphytal habit; from Burmanniaceae by their leaves not being equitant nor their fruit winged; and from Taconiaceae by all their habit and their fruit being three-angled, with central placenta. With the exception of the pine-apple, so well known as a valuable fruit, and of certain species of Tillandsia, whose dry, elatic leaves render them fit for stuffing mattresses and the like, Bromeliaceae are of no known uses. Many species are cultivated in the hot-houses of this country, the most beautiful of which belong to the genera Bromelia and Billbergia: they all grow readily in decayed tan. No species has been yet seen wild in any part of the old world.

BROMINE, an elementary fluid, discovered in 1826, by M. Balard, a distinguished French chemist. The name of this substance is given to it from bromus (bromos), a stick or strong smell, on account of its powerful and disagreeable smell. The first paper by its discoverer from the mother water or bitter remaining after the crystallization of common salt at the salt-works of Montpellier. It was soon afterwards found in sea-water in the state of bromide of magnesium, and has since been met with in various salt-springs, and especially those of Germany. At Theodors-

136,000 sheep (about 600,000), and other domestic animals are reared. The manufactures consist of wool, linen, hemp, salt, tobacco, &c.

Bromberg, also the name of one of the nine minor circles, lies adjacent to Western Prussia in the N. and E., and contains about 567 sq. m., with about 41,000 inh. The capital of the district is the town of Bromberg, which is situated on the river Elbe, in German Poland, it is called 'Bydgoszcz.' It is situated about 5 m. W. of the Vistula on an eminence, the base of which is watered by the Bylau and Vistula with the Netze, passes through Bromberg. The number of houses is about 615, and the pop. amounts to about 6800. Bromberg is well built, has two suburbs, and contains three churches, a monastery, and a convent, a gymnasium, a seminary for educating teachers, and two other schools, one of them for poor children; an infirmary, a house of correction, two hospitals, and a royal granary and depot for iron. Among other manufactories Bromberg has a large soap Manufactory, two tobacco factories, several flour and oil-crushing mills, some potteries, and lime-kilns, &c. The export of its manufactures, together with a brisk trade in grain, cattle, &c., and the transit trade to the port of Gumbinnen, at 53° 7' N. lat. 18° 29' E. long., and about 220 m. N.E. of Berlin.

BROME-GRASS, the name of various species of true grasses belonging to the genus Bromus. They are known by having their spikelets many-flowered, twoawl-shaped glumes, and a palea or lodicule, a lemma, and a lodicule, which has a rough, straight, rigid awn proceeding from below the tip of the valve. The species are common annuals in fields, hedgerows, and dry, sterile places. None are of any value to the farmer. The distinctions of the species are not very certain.

BROMELIAE, a name derived from the genus Bromus, applied to a large number of grasses, the commonest of which is Bromus paniculatus. They are known from Amaryllidaceae by the latter circumstance, by their hard scurfy leaves, and by their habit; from Burmanniaceae by their leaves not being equitant nor their fruit winged; and from Taconiaceae by all their habit and their fruit being three-angled, with central placenta.

Bromine suffers no change by the agency of light, heat, or electricity, and having never been decomposed, it is readily kept in water. Its solutions are disinfecting and antiseptic, its action on bacteria neutralizes their activity, and its decomposition of its compounds by electricity is evolved at the positive wire, and consequently resembles in this respect oxygen, chlorine, and iodine, and is like them also in being, when vaporized, a powerful supporter of combustion; some substances become more inflammable, and it as chlorine girt of it, is a brown colorless liquid, is soluble in water and alcohol, and especially in ether; it resembles chlorine in destroying vegetable colour. It is a very corrosive, acting upon and destroying organic matter with great energy. It is not less effective in the decomposition of starch and proteins.

Oxygén and bromine form only one compound, which is known as Bromic acid. These elements do not combine directly, but only when exposed to each other in their nascent state.

Equivalents...
acid decomposes a portion of the sulphuric acid. The best method is to mix bromine and phosphorus and a little water; the consequent action bromidizes phosphorus, converts phosphorus, which decomposes water, and evolves hydrobromic acid gas, which may be procured in the gaseous state over mercury, or dissolved in water.

Hydrobromic acid gas is colourless, and forms a thick vapour on coming in contact with the air. Its smell resembles that of muriatic acid; its specific gravity, according to Berzelius, is 2:731; 100 cubic inches consequently weigh 84.72 grains. It acts upon the metals and their oxides precisely in the same way as muriatic acid gas. It is not altered by being passed through a red hot tube, either alone or mixed with oxygen gas. Chlorine separates the bromine from it, and muriatic acid is formed. Hydrobromic acid gas is very soluble in water, and the solution has a greater specific gravity than water; and all the acids are converted to the chlorides by sublime acid, and suffers no change by exposure to the air. Nitric acid decomposes it, and aqua regia is formed, which dissolves gold and platinum.

Hydrobromic acid is composed of

One equiv. of hydrogen = 1
One " bromine = 80

Equivalent = 80

When it is decomposed by potassium, hydrogen gas, equal to half the volume of the acid submitted to experiment, remains, and bromide of potassium is formed.

Chlorine and bromine are obtained from chloride of bromine. It is prepared by passing a current of chlorine gas over bromine, and condensing the vapour arising by a freezing mixture. It is liquid, has a reddish-yellow colour, lighter than that of bromine. It has a strong, unpleasant smell, and its taste is bitter. It is volatile, dissolves in and is solubile in water: the solution possesses bleaching power. It does not possess acid properties, but when mixed with the alkalies forms chlorides and bromides. It has not yet been analysed.

Carbon and Bromine form a liquid bromide of carbon. It is composed of 51.8 per cent. of iodide of carbon upon bromine. It is a colourless liquid which has an ethereal and penetrating smell, and it communicates to water an exceedingly sweet taste. It is heavier than water, and becomes solid by exposure to about 45° of Fahrenheit. It is decomposed by heat, vapour of bromine being evolved. It has not been analysed.

** Sulphur and Bromine.**—These substances combine readily by mere mixture; the resulting bromide is fluid, has an oily appearance and reddish tint. It emits white vapours when exposed to a cold; it is not volatile, it reddens litmus paper strongly, but slightly when dry. Boiling water is decomposed by bromide of sulphur, and there are produced hydrobromic, hydro sulphuric, and sulphuric acids.

** Phosphorus and bromine.**—These substances combine readily to form two compounds; the protobromide is liquid, and the perbromide is solid. The protobromide is composed of one equivalent of bromine 79, and one of phosphorus 16 = 85. Both bromides are prepared by mixing these elements in a flask containing carbonic acid gas: action takes place, with evolution of light and heat, and there are formed the solid protobromide which sublimes in the upper part of the flask, while the fluid perbromide remains in the lower part. Its composition is not certainly known.

The perbromide is of a yellow colour; by heat it becomes red. It decomposes water, and there are formed hydrobromic and sulphuric acids.

Bromine and iodine form probably two bromides of iodine; one of bromide, or that so considered, is a solid compound, which is by heat convertible into a reddish-brown vapour, condensing into small crystals of the same colour, resembling fern leaves in appearance.

When bromine is added to the above described crystals a liquid results which contains the bromine, which is given a solution possessing bleaching power. It is probably the bromide of iodine.

We have now mentioned the principal binary compounds of bromine, except those which contain a metal; for these as well as for an account of the monobromides their oxides form with bromic acid, we refer to each particular metal.

But little use has hitherto made of bromine; the bromide of potassium has however, been employed in medicine.
Bromsgrove is situated in a highly-cultivated and richly-wooded valley. On the Lickey Hill, which forms one of its activities, are the sources of the riv. Rea, which flows through Birmingham; of the Salwarp, which passes through Droitwich; of the Arrow, and of several small streams, some of which are swallowed up in the bend and throw nothing into the Irish channel, while others descend in the opposite direction to the basin of the Trent and the German Ocean. The strata belong to the new sandstone formation. The Lickey is composed of quartz, and must at some period have been a sand hill or sand plain; for it is considered by geologists as the source from whence have been derived the vast beds of gravel which extend through Oxfordshire, in the valley of the Evenlode, and even along the Thames.

In the par. of Stoke Prior, and closely adjoining that of Bromsgrove, is situated the extensive salt and alkali works carried on by the British Alkali Company. As this establishment furnishes an instance of the rapid introduction of a manufacture into a district which had been previously confined to agriculture, a short notice of its progress may be inserted.

The manufacture of soda has been carried on for centuries in the adjoining bor. of Droitwich, where it is prepared from rich springs of native brine. The only situations where rock-salt had been met with in this is., were in Cheshire, previously to its being discovered at Stoke Prior. The works were commenced in 1829, in the course of searching for a pit in search of brine. The beds of salt were of great thickness, and were excavated to a considerable extent; but at present the supplies of making refined salt are derived from the soft deposits, which are only removed in the excavations. Immediately after making this discovery, the proprietors erected extensive works for the manufacture of soda, and for the preparation of British alkali, by the decomposition of its substance, which very speedily changed the green hill and retired lanes into an active and a lively village. The beneficial effects of this introduction of an extensive manufacture commence with an immediate demand for the surplus labourers, an increased consumption of the necessaries of life, and a contribution towards meeting the parochial expenditure; the neighbouring agriculturist finds his burdens relieved, at the same time that a market for his productions is brought into his immediate neighbourhood. A dispassionate view of instances such as the present would tend greatly to subdue the idea of the injury which extends the agricultural and manufacturing interests in this kingdom. The benefits derived from the successful establishment of a manufacture is not confined to the labouring poor, and to the inhabitants of the place in its vicinity alone, but extends more widely: thus in the iron manufacture works being situated on the banks of the Birmingham and Worcester Canal occasioned, on their being fully established, an increase in the value of that property to the extent of 70 per cent.; and the influence they are likely to produce in the rising port of Gloucester, by furnishing to it a large supply of salt for exportation, is calculated to be very considerable.

Opposite the third vertex of the back the tracheae divide into two great branches, named the bronchi, one branch for each lung; the right bronchus going to the right lung, and the left bronchus to the left lung.

Each of the bronchi at the place where it enters the lung, subdivides into several branches which penetrate the substance of the lung, where they again divide, subdivide, and spread out after the manner of the branching of a tree. Successively diminishing in size as they subdivide, the bronchi at length form an infinite number of minute tubes, at their ultimate terminations dilate into the air-bags termed the air-cells of the lungs. The larynx, the trachea, the bronchi, and their ramifications, together with the cavities of the nose, the mouth, and the pharynx, are all classed together under the common name of the air-passages. All these parts are of the same nature; from the nature of its secretion is termed mucous membrane. In every part of the body the mucous membrane possesses the same essential structure, and is subject to analogous diseases. Accordingly, although the structure of the mucous membrane of the air-passages is somewhat modified in the nose, in the air-passages, the larynx, in the trachea, in the bronchi, and in the air-cells, according to the different functions which it has to perform in these different organs, yet as it possesses in its whole extent the same essential characters, so the diseases to which it is subject are perfectly similar. All these diseases may be included under congestion, inflammation, haemorrhage (effusion of blood from its surface), emphysema (the dilation of the tubes), and polypi (concretions growing from its mucous membrane, which obstruct and sometimes nearly obliterate the tubes).

Of these diseases inflammation is by far the most common and the most important. Inflammation of the mucous membrane of the air-passages is divided into species according to its effects, whether it be pusulose, catarrhaceous, or phlegmonic, according to the duration of the inflammatory action terminates. Thus the inflammation may terminate in a secretion which does not concretion after its formation; this is termed catarrhal inflammation. It may terminate in a secretion which instantly concretes as it is formed; this is termed plastic ulceration. It may terminate in the destruction of the mucous membrane and the formation of ulcers; this is termed ulcerous inflammation.

When the air-passage is constricted, as it often is, to that portion of the membrane which lines the nose, it constitutes the disease commonly known under the name of cold or catarrh, the disease is termed mucous membrane, the inflammation extends to the mucous membrane which lines the fauces, tonsils, and pharynx, the disease is termed tonsillar and pharyngeal. When the inflammation is seated in the portion of the mucous membrane which lines the bronchial tubes and their ramifications, it constitutes the disease termed bronchitis.

While common function is performed by the air-passage from its commencement at the mouth and nostrils, to its termination in the air-cells, namely, the transmission of air and from the lungs, additional and very different functions are performed by the several portions of this extended tube. Accordingly inflammation of the membrane that lines it produces widely different effects, according to the portion of the membrane in which the disease is seated; giving rise to the distinct forms of disease just enumerated. The description of these several diseases is given under their respective heads. The disease hamed bronchitis is that at present to be treated of.

Medical writers distinguish between what they term the state of congestion and that of inflammation. In congestion the blood-vessels are merely loaded with a preternatural quantity of blood. The part of the body, besides being loaded with a preternatural quantity of blood, is in a state of diseased action, which, without any precise knowledge having been acquired of the nature of that action, is termed inflammatory. Simple congestion of
the mucous membrane of the bronchi is a frequent affection, which may be induced by any cause that impedes the return of the blood to the left side of the heart. If suddenly and intensely produced, which sometimes though rarely happens, almost always with all the symptoms of asphyxia [asphyxia]. Several cases of this character have occurred, excepting a general congestion of blood in the capillaries, mucous membrane, of the bronchi and its ramifications.

In a slighter form, congestion of the mucous membrane of the bronchi is a constant attendant on various diseases, more or less favorably of every type, whether common continued fever, or typhus fever, or small-pox. In the state of congestion the mucous membrane is preternaturally red, the tinge of color varying according to the intensity of the affection from a pale to a bright red or purplish.

When the mucous membrane of the bronchi is in a state of active inflammation, it is of a bright red or crimson color. This inflammatory redness may be partial or general; but it more commonly affects particular parts of the mucous membrane than its entire surface. Sometimes the redness is confined to the larger bronchial tubes, or it may be limited to the smaller. Sometimes it exists in the bronchi of one side only; at other times it equally affects both bronchi.

The consequences result from the congestion and inflammation of the membrane: first, the swelling and thickening of the membrane, in proportion to which must of course be an obstruction to the passage of the air; and, secondly, an increase in the quantity of its mucous secretion. This increase in the secretion is chiefly the result of inflammation, in some cases of which affection the secretion becomes so excessive as to completely fill the bronchial tubes, and thereby to occasion suffocation.

The trachea and the bronchial tubes being mere conduits of air and not its repository, the increase in the quantity of the air-passage must of course relate chiefly to impeded transmission of the air. Accordingly, difficulty of breathing is the most prominent symptom of inflammation seated in this portion of the air-tube. This difficulty of breathing is proportionate to the obstruction to the passage of the air, which is proportionate to the degree of the swelling of the membrane, and to the extent of membrane involved in the inflammatory affection. If the inflammation be limited to a portion only of a single tube, the swelling of the membrane is not so much noticed; the whole tubes of one side, the difficulty of breathing will be considerable; if it affect all the tubes of both lungs, the difficulty of breathing may be so great as to prove fatal. Together with impeded respiration, there is a feeling of the air catching in the bronchial tubes, a sensation of a sense of heat, sometimes amounting to a burning sensation, often referred by the patient to the sternum. Cough is always present. The cough at first is dry, because the membrane is dry; but the secretion soon becomes more abundant than natural. The matter first secreted is acrid; and this acridness diminishes as the quantity of the secretion increases; and when the matter secreted assumes a yellow color, it is always quite bland; and then the cough is loose and the expectoration free.

The local signs by which the inflammation of the bronchi and of their ramifications is ascertained and discriminated from all other diseases, have reference to these two conditions.

When the inflammation of the mucous membrane of the bronchial tubes is considerable, the swelling of the membrane may be so great as completely to close that portion of the tube in which the inflammation is seated. The consequence must be that the respiratory murmur [respiration] cannot be heard in that portion of the lung from which the tube supplies, since no air can pass the obstructed point; accordingly, on applying the ear, or the stethoscope [stethoscope] to the chest it is found, especially in severe affections of this kind, that the respiratory murmur is invariable dull and stertorous. If, on the other hand, the inflammation be not so much swollen as completely to close the tube, then another and a totally distinct sound is produced—a whistling sound, a sound always
observed to accompany an indistinct respiratory murmur, on account of the diminished calibre of the bronchial tube.

Moreover, when the swelling of the membrane diminishes, the nature of the sound is again entirely changed. It now becomes a loud, deep, and sonorous breathing, the intensity of which is sufficient to cause a vibration upon the parietes of the chest, distinguishable by the hand; at the same time the respiratory murmur becomes more distinct, denoting that the bronchial tubes are more open; finally, the deep sonorous wheeze assumes a still fuller bass, merges in the respiratory murmur, and gives it a roughness which is termed rough respiration.

On the other hand, where the secretion re-appears and is in excess, a wheezing sound is produced, which is loud and noisy in proportion to the quantity of gas contained in the tubes. This sound, when it is formed in the trachea, can be heard through the medium of the air alone; but the application of the stethoscope, or the ear, to the surface of the chest is necessary when it is formed in the bronchial tubes.

By these local signs it is possible to decide at once whether the disease in question be bronchitis or not; it is possible to determine the exact extent of the affection; for the wheezing may be heard only in a single line, as if in the diameter of the bronchial tube at the back of the chest, over one lung, and occasionally over both; and by judging of the distance of the sound from the ear, it is possible to tell whether the bronchial tube affected is in the centre of the organ or at its surface. In this manner we are taught that the bronchial tubes are the most important organ in the disease, and that this kind of sound is induced in the morbid condition of the organ.

Besides these local signs or symptoms derived from the altered condition of the immediate seat of the disease, there are others derived from the disturbance of the system in general. The skin is hot to the touch, and on pressure it becomes livid; the pulse is quick and thready, and occasionally contorted; the breath is short, and the patient feels extremely uncomfortable. The disease is termed Fern or whenever any organ of the body is affected with any disease of a certain grade of intensity, in addition to the peculiar organ, the natural functions of the great and general systems, such as the nervous, the circulatory, the digestive, and so on, become disturbed. The disturbances of these general systems is always of a certain kind and takes place in a certain order, giving rise, as has been just stated, to the train of symptoms which constitute fever. The fever thus induced is not a primary disease, it is occasioned by the sympathy of the system with the disease of some particular organ: this secondary form of fever is called fever due to affection of the correspondent system, or more idiosyncratic or Fern, when it is the original and essential disease, which is termed idiopathic Fern. The general or feverish symptoms are languidness, indisposition to motion, chilliness, often amounting to shivering, pains in the limbs, and more especially to the limbs and back; frequent desire to vomit; insensibility, or inability to carry on the intellectual operations with the usual vigour. The pulse is rapid and weak, and the urine scanty and limpid. These symptoms are soon followed by irregular flushes of heat, sometimes occurring at one part of the body, sometimes at another, alternating with the cold and intermitting with it, so that the patient feels frequently, in consequence of the rapidity of these changes, the two different sensations in the same place and almost at the same instant. The skin at length becomes universally hot, and commonly dry; head-sache comes on; there is more or less thirst; the pulse continues rapid, but becomes full; and the urine, which is still small in quantity, is now high-colored. Then perspiration succeeding to the hot flushes, and the headache, the fever is now in a greater or less degree to their natural condition, and there is a corresponding remission of the symptoms. After this remission there is commonly an accession of the febrile attack, usually in the evening.

Horses.—It is not a common disease in the horse, but is easily recognized by an interrupted wheezing sound in the breathing that can be heard at some distance; a tendency to coldness in the extremities, distinct from the somewhat more general coldness of the feverish diseases; the deep and deathly imprecations of inflamed lungs; a pulse quicker than in catarrh or the early stage of pneumonia, not so hard as in pleurisy, more so than in catarrh or inflamed lungs; the nostrils dilated, and the respiration strangely quickened, being more so than in catarrh or pleurisy; an almost perfect inability to move in frosts, in rainy weather, or in the water; a cough exceedingly painful; a purulent discharge from the nostrils of a greyish green colour, which soon becomes febrid or mingled with blood; the breath hot; and no expression of pain in any part of the body, excepting looking at the side or flank. Pieces of hardened mucus, or organized membrane, are also frequently coughed up.

Bronchitis is sometimes a primary disease, but it is often the consequence of neglected catarrh or long-continued but slight inflammation of the lungs. It is occasioned by an indistinct respiratory murmur, on account of the diminished calibre of the bronchial tube.
sionally epidemic. Every affection of the respiratory organs will then rapidly degenerate into this disease. As it pursues its course, it is accompanied by febrile inflammation, and the calibre of the bronchial tubes is proportionally diminished, while the mucous secretion is abundantly increased, and consequently the animal dies of suffocation, the air-passages becoming completely clogged.

bledrug should be early resorted to, but very cautiously; for what is true of every mucous membrane is more especially so here—the patient will not bear considerable or rapid depletion. While the blood is flowing, the finger of the veterinary surgeon should be on the submaxillary artery, and the vein should be pinched up as soon as the pulse begins to falter: four pounds will scarcely be withdrawn before this will be the case. Physic should also be administered, but very cautiously; for the sympathy between the mucous membranes is sooner developed in this than in any other disease, and a degree of purging is readily excited which bids defiance to all control. Two draçhms of aloes should be administered morning and night, until the face becomes softened. The dung having been rendered pulviscous, powdered digitalis, nitre, and sulphur should be administered morning and night, in doses varying according to the circumstances of the case. From half a draçhms to two draçhms of the first may be given, and from two to four draçhms of each of the other drugs.

A blister is indispensable, and it should cover the brisket and nape of the neck, and the wind-side, as far as the tail. The horse should not be coaxed to eat, and nothing more nutritious than mashes should be allowed.

Cattle.—Bronchitis is a still more formidable disease among cattle, and many thousands of animals are yearly destroyed by it. It is a very fatal disease, at first produces, and which inexorable inattention and idleness suffer to continue, almost inevitably terminates in bronchitis or infammation of the lungs, or both united. The food of cattle is much concerned in the production of it. It is well known that the very refuse of the farm, and the common aliment of the yearling cattle, too generally and fatally produce inflammation of the air-passages; and many a beast comes from the straw-yard bearing the seeds of death within him. The incipient symptoms of this disease however are young cattle, yearlings, and especially in low marshy or woody countries. On an upland farm, and particularly on a chalky and loamy soil, it is comparatively seldom known. It oftener prevails in dry seasons, when the water of the brook fails, and that of the ponds is putrid and filled with animalcule.

The attack of bronchitis is somewhat sudden; the animal has a dry, husky, and peculiarly distressing cough, and very soon begins to droop and to lose condition. It is painful to see how it has already lost half of its head, the nostrils, and anxious countenance; violently coughing, almost without intermission, until he is completely exhausted, and falls or dies of suffocation. This state of misery continues from a fortnight to a month. On examination after death the bronchial tubes exhibit some inflammation, yet far less than could be expected; while, characterising the disease, and fully accounting for all its distressing symptoms, these passages and the wind-pipe, and often the larynx and the fauces, are filled with small worm-like vermin, being a kind of cost mixed with the mucus, or connected together in knots of various sizes. The disease is either produced or much aggravated by the presence of these worms and the irritation which they produce.

These worms belong to the genus streptoga, and the species gladiator. They are very long, slender, from half an inch to two inches in length; the body round, the head obtuse, the mouth circular, and surrounded with minute barbs, or elongated papilles; the tail of the female pointed, and that of the male somewhat rounded and oblique. The female produces the smallest, and the male the greatest number of the ova, but so few as to appear to have been deposited there accidentally, are occasionally found enclosed in the mucus of the windpipe and the air-passages of the lungs. Of the natural history of this worm nothing is known, but the fact that the whole body is filled with the worms shows that this is the last if not the only state of its existence.

The ova or the minute worms are received from the pastures, or, more probably, from the water, when stagnant or loaded with animalcule. Being alive, they escape the digestive powers of the stomach, and mingle with the blood, and thread the various circulatory passages until they arrive at a congenial abode; or the ova may be hatched out in the windpipe, the nasal passages, the mouth, and then wind their way to their destined residence.

The modes of cure are evident: we should either destroy or remove these intruders, or strengthen the animal so that he shall bear up against the irritation which they excite: for it is well known to the farmer that if the patients, by the natural power of their constitution, or by the application of certain means, can struggle with the disease until the cold weather sets in, and the worm dies, or must find another residence, they will eventually recover. The pasture should be changed as soon as the disease is discovered. The supply of fresh recruits will be prevented, or possibly that deleterious master, whether connected with the water or the pasture, which is necessary to their thriving and multiplying, will be no longer obtained. The simple change of pasture in an early stage of the disease has saved thousands of young cattle.

If these parasites have so far established themselves as to resist this mode of attack, it must be considered whether some agent cannot be brought into actual contact with them, which will either destroy them, or so far annoy and weaken them, that they will lessen their hold and be expelled by the convulsive coughing of the calf. The most obvious method of accomplishing this is to cause the patient to breathe some pungent and deleterious gas, such as that produced by the burning of sulphur or the evolution of chlorines. By both of these fumigations the worms have been quickly and perfectly destroyed, but there is considerable care required in the management of these experiments; inflammation in the air-passages, very difficult afterwards to allay, has been produced, and occasionally the beast as well as the worm has been destroyed. This is, however, a last resource, and should never be intrusted to inexperienced hands.

There is a less dangerous and nearly as effectual a course to pursue. There are certain substances which undergo little or no change in the stomach or the intestines, but can be taken up by the absorbers and enter into the circulation and are conveyed to every part of the frame, producing, when needed, their peculiar and beneficial effects: thus digitalis lowers the action of the heart, and purgatives increase that of the kidneys. Are there any of these substances that are destructive to worms and that can be thus conveyed to the bronchial tubes? Turpentine certainly may, for if a very small portion of it is swallowed it is soon recognisable in the breath. It may be given to cattle in considerable quantities without the slightest danger, and thus may be brought into contact with produce the destruction of these parasites. Common salt readily destroys many species of worms, and is conveyed through the circulatory vessel to a sufficiently pure state to expel these vermin from the air-passages: at the same time it is an admirable tonic, and supports the decaying strength of the animal. The most powerful vermifuge however in these cases is lime-water, and if half a pint of it, with a couple of ounces of soda, is given to each patient every morning, attention being paid to a change, and perhaps a repeated change of pasture, and to the comfort of the animals in other respects, the majority of them will be saved.

This disease occasionally appears in lambs, deer, and swine. The mode of treatment should be the same as for calves.

[THE PENNY CYCLOPAEDIA.]
BRONCHOCELE (Bröycouchela), from Βρόχος (bronchos), breath, and κελευθρόν (keleuthron), a swelling, is a swelling in the upper and upper part of the neck, occasioned by a preternatural enlargement of the thyroid gland. The tumour is free from pain, generally of the natural colour of the skin, does not readily inflame, and is but slightly compressible. Often the swelling is rather a deformity than an inconvenience; but occasionally, and especially when the tumour is large, it causes serious evil, by obstructing the voice and the respiration.

When the swelling first appears, it is soft, spongy, and elastic; after some time it assumes a more firm and flabby consistence, being however firmer in some places than in others, and it gradually spreads towards each side of the neck until it attains in some cases a prodigious magnitude. In many cases the disease affects the larynx, but occasionally only one lobe is enlarged. When the swelling attains a great size, and the lower part of the gland is more especially involved in the disease, the tumour hangs pendulous from the neck. On examining the interior of the gland, it is found that the tumours are of different sizes, which are all filled with a transparent viscous fluid. Nothing is known of the real nature of this disease. Little is ascertained of the causes which either predispose to it or which produce it. A few cases are recorded, which are somewhat exceptional, but in some cases when no cause is known.

In the present instance, several of the causes assigned are contradictory. What is certain is that there are countries, or rather particular places in certain countries, for example, France, Flanders, Tyrol, Germany, and parts of America, and some places in Great Britain, as Devonshire, in which the disease is endemic (common to the inhabitants of the same country, from some cause specially connected with that country). It is much more common in females than in males. In Great Britain it is very seldom seen in males, but in Switzerland, and in other places in which it is very prevalent, males are more often attacked than in Britain. It commonly occurs about the age of puberty, and in girls seems to be strictly connected with an irregularity in the menstrual system. In this country, and in the Alps, we have considered a number of cases which have come before me in females, I have never met with any before the period of commencing puberty, nor even at the Infirmary for Children, although the menses have often been delayed for a year or two, or even longer, when the tumour has appeared. I have often observed an instance in this sex unconnected with any irregularity of the menstrual discharge, or disorder of the uterine functions. In two cases occurring in married females, who were under my care, unhealthy or irritable individuals, the disease was connected with the obstetric condition of the goitre; in one case for eight years, in the other for five; upon its disappearance pregnancy took place in both. Suppression of the menses has sometimes caused its sudden appearance and rapid development; and it more rarely has occurred during the puerperal or post-natal state and the amenorrhoea of the puerperal state. An author has added conclusive proofs of its occurrence here, independently, of endemic influence.

It has been said to have an intimate connexion with poverty and bad food, the rich being comparatively exempt from it, but on this point our observations are conflicting. It has been very generally attributed to water used as drink, and more especially to snow-water; but the disease occurs where there is no snow, as in Sumatra and several parts of South America; the persons who drink snow-water are free from it, and those who have not water which has a hard spring resist it. It appears to be a peculiarity of the districts, in a district in Switzerland, to the use of spring-water impregnated with calcareous or mineral substances; and he states that those who use not this water are free from both goitre and cretinism. Dr. Coiner observed that those who drink milk or other water, who drink from the two sources, are those most liable to bronchocele. Its prevalence in Nottingham is ascribed by Dr. Manson to the same cause; which also seems to occasion it in Sussex and Hampshire, in the valleys of which counties it is frequently met with.

In Switzerland, and in many other countries, and in warm valleys even in the very districts in which it is endemic, the inhabitants of dry and elevated situations are exempt from it; but it is probable that the malaria of those places operates only as a predisposing cause, favouring the disease upon the seat of its otherwise acquired agency.

But in whatever obscurity the nature and cause of this disease may be involved, there has been recently discovered for it a very effectual remedy in the substance called iodine. This remedy has been employed with great advantage at Lissabon, and particularly by the late Dr. Manson of Nottingham states, that out of 120 cases treated with it by him, 79 were cured, 11 greatly relieved, and 2 only were not benefited by it. Other physicians, who have had considerable experience of bronchocele, bear the like testimony as to the efficacy of iodine. For the remedy is a very easy one; it is taken internally by the patients, and, after being largely diluted, should be employed. In obstinate cases the external use of it may be combined with its internal administration, but great care should be taken that the ointment which is rubbed into the tumour should not be of sufficient strength, about 2000, on the affluents of the Simathius or Giarrera (Cluverius). It has a manufacturing process which is called to the woollens. Pop. 9400. (Smyth's Sicily.) Bronte is a modern town (notwithstanding the fabulous tradition which derives its name from one of the Cyclops), and has grown out of the convent of the same name. (Ferrara Storia dell' Etina.) It was formerly a fief with the title of Duchy. Admiral Lord Nelson was made Duke of Bronte in 1799, by King Ferdinand, as a reward of his services in the cause of that prince, with an income of 6000 Guerini, and a coat of arms. (Cotta's Storia dell'Itina.) It is 22 m. N.W. of Catania, and 55 m. S.W. of Messina.

BRONZE, Ital. bronzo; Fr. bronze; Gr. χάλκος (chalcos), Lat. aes, is essentially a compound of copper and tin, which metals appear to have been among the earliest known to man. Copper is a hard, malleable, ductile, and fusible metal; it is highly malleable when it contains 85 to 90 per cent. of copper; it is tenacious of its form; it oxidizes very slowly in moist air, and hence its application to so many purposes. The density of bronze is always greater than that of either of the metals which compose it; for example, an alloy of 100 parts of copper and 12 parts of tin is of specific gravity 8.80, whereas by calculation it would be only 8.63.

The physical properties of the word 'bronze' has not been ascertained, but it is first met with in Italian writers to express this mixture of metals, and it is not very improbable that it is a corruption from the Italian, which signifies brown, the bronze of the Italian, and particularly the Finish people. The name agrees with the pump-patching of that colour, which is nearly the original tint of the metal when left in its natural state. The green hue that distinguishes antient bronzes is acquired by oxidation and the combination of carbocondic acid, and the moderns, to imitate the effect of it, have found some times advance that process by artificial means; usually by oxidating the surface of the article with an acid. Varisi alludes to this practice among the artists of his time, and to the means they adopted to produce a
was Hiram, a native of Tyre, 'who was cunning to work all works in brass.' (1 Kings vii.) These works, we are told, were cast and wrought.

We know so little of the earlier history of the arts in India, that we must be satisfied with observing that many specimens of their bronze works, of which we possess some curious examples, have come down to us from the time of their discovery. It is clear however that, for a long period, copper, if not the only metal known, was at least the most abundant, for we find it was employed universally for arms, ornaments, and utensils, domestic and agricultural. India has a long history of metal-working, and the processes of metallurgy seem to have been practised at a very remote date both in Asia and Egypt. On this subject the Old Testament is our best authority, and the accounts we there find lead us to believe that considerable skill had been attained by the very earliest nations. Tubal Cain was, we are told, a great worker in metal. Among the earliest allusions to works in metal in the Books of Moses is the mention made of the presents offered to Rebecca: Abra- ham's servant gave her a 'golden earring of half a shekel weight and a gold bracelet of half a shekel weight of gold,' and spoke to her of his master's riches, particularly mentioning silver. (Gen. xxiv. 22.) The accounts of the ornaments and utensils in the history of Jacob, and of Joseph, and in various other passages of the Old Testament, witness to the extensive use of metals at that time; and their being applied to purposes of luxury indicates that considerable progress had been made in the art; long use naturally preceding any attempt at refinement. The earliest recorded names of sculptors (and perhaps the earliest process of working in brass) are those of Moses and Aaron. One was Bezaleel, of the tribe of Judah, who was filled with the spirit of God, in wisdom, and in understanding, and in knowledge, and in all manner of workmanship, to devise cunning works, to work in gold, and in silver, and in bronze, and in stone, and in wood, in purple, and in blue, and in red, and in fine twined linen, and in electronics, and in all manner of work in wood. He was of the tribe of Dan. They were the artists appointed to execute the works of the Tabernacle. (Exod. xxxi.) Among the Egyptians also the employment of metal was known in times prior to any historical record; and it is probable that the metal-working knowledge possessed by other countries was derived directly or indirectly from this source. Among other proofs of this, the casting of the golden calf by the Israelites may be cited. It is remarkable however that, among the remains of the ancient art, no works in metal, seen or heard of in various parts of Egypt, none have been found of large dimensions. Some of the most remarkable early works in metal mentioned in history are those recorded by Diodorus Siculus, who in this part of his history followed Ctesias; the only other genuine and reliable author is Xenophon. He describes works in gold and bronze which decorated the gardens of Semiramis, of such a magnitude, and representing so great a variety of subjects, that, if we are to place any confidence at all in the testimony of this writer, we must conclude that the Assyrians and Babylonians had attained very great proficiency in the arts connected with metallurgy. That the statements of Diodorus, which in fact are those of Ctesias, to be received with some qualification, must be granted; but we must not refuse to admit that there were works in metal, which were certainly possessed of many useful arts, and at one time commanded the resources of western Asia.

It is much to be regretted that we have no remains of Phoenician art. The skill and enterprise of this people gained them a command over the commerce of all nations, and they must have materially influenced the civilization not merely of neighbouring but of remote countries; but unfortunately the few monuments that can be referred to Phoenician origin (namely, those found at Carthage, Phoenicia, with which we have no connection and no date except that the brilliant epoch of the Phoenician nations to be fairly quoted as specimens of original taste or practice. Their contacts with Britain furnished them tin, or probably they procured it from Spain or Eastern Asia.

Homer has immortalized the Sidonians with the distinguished title of *Σέλενος σιδηναίων,* the Sidonians the skillful workmen. The artificer employed by Solomon in the decoration of the Temple (about 1000 years before our era)
with a centre or core to limit the thickness of the metal. The first artists who are celebrated by the historians of Greek art for their success in metal-casting are Rhoeus (who is said to have invented the casting of tussul), Theodorus, and Telecleus, natives of Hermione (Herod. i. 50; Paus. viii. 17. 1 Plin. N. H. xxxv. 12); and the manner in which they are spoken of proves that their works were held in high estimation long after their own time. There is some difficulty in fixing their date with precision, as there were two or three of them, but it is certain that the first artists so called lived between 700 and 600 B.C. Theodorus is made by Herodotus the contemporary of Crossus, who was defeated by Cyrus B.C. 537. Cadias of Sparta and Glauca of Aegina hold also a distinguished rank among the earliest casting artists, for whom Herodotus (v. 77) says that four bronze horses were made by the Athenians from the tenth part of the value of the ransom of the Boiotians and Chalcidians: the horses were placed at the entrance of the propylea on the Acropolis, with an appropriate inscription. The ancient artists do not appear to have considered it important to cast their statues entire, for Pliny acquaints us with the composition used for soldering the parts together. The finest collection of antient bronzes, taking it as a whole, is at Naples: among its crowning ornaments are several statues, in the manner in which the ringslets of hair, worked separately, are fastened on: many of these are the size of life. Bronzecasting seems to have reached its perfection in Greece about the time that the so-called Great, or Salt, statues were given of the works executed about that time almost exceed credibility. After Lysippus, the favourite sculptor of Alexander, who executed, according to Pliny (xxxiv. 8), above 600 works, the art declined. The reason seems to have been extremely choice in their selection and composition of bronze. Two of the most celebrated, contemporary with Phidias, carried their rivalship so far as to employ bronze of different countries: Polykleus preferring that of Aegina, while Myron always used that made at Delos. The artists seem to have had a method of running or welding various metals together, by which they were enabled to produce more or less the effect of natural colour. Some works are described that were remarkable for the success which attended this curious process, and one of the most celebrated, called by the Corinthians, has been too often repeated to require further notice here. Pliny himself refutes the story which he records. He informs us also that there were three sorts of the Corinthian bronze. The first, called candidum, received its name from the effect it produced when mixed with gold; the second had a greater proportion of gold; the third, Pliny says, was composed of equal quantities of the different metals. The antient writers mention several of the bronzes that were used. (Antichit. ii. 6; Plin. xxxvi. 8; Aristotle, Hepaticus, or live coloured; As Deliacum, and As Agelinetum — Pliny refers the composition of the Delian brass was a secret lost in his time — As Demonneseus, As Nigrum, and, last, Tartessian bronze (Tartessenus, or colourate), of which it must be confessed, we know little or nothing beyond their titles. An analysis of a few specimens of bronze of undoubted antiquity, namely a helmet with an inscription (found at Delphi, and now in the British Museum), some nails from the treasury of Atrius at Mycena, an antient Corinthian coin, and two harps spoken of by Pliny as of antient make, and also in the British Museum, affords about 87 or 88 parts copper to about 12 or 13 of tin per cent. The experiments of Klaproth and others give nearly the same results as to ingredients; the quantities sometimes differ slightly, but are in general well agreed, and no mixture has not been found in any quantity sufficient to warrant a belief that it was intentionally introduced; indeed it is thought that its nature was not understood by the antients. In an analysis of copper ores made in a later period, the proportion in 100 parts was 87-47 of copper to 12-53 of tin, with a portion of zinc so small as not to be worth noticing (Monges, Mém. de l'Instit.); the same may be observed of minute portions of silver that have sometimes appeared in the分析 of a few specimens of bronze of undoubted antiquity, namely a helmet with an inscription (found at Delphi, and now in the British Museum), some nails from the treasury of Atrius at Mycena, an antient Corinthian coin, and two harps spoken of by Pliny as of antient make, and also in the British Museum, affords about 87 or 88 parts copper to about 12 or 13 of tin per cent. The experiments of Klaproth and others give nearly the same results as to ingredients; the quantities sometimes differ slightly, but are in general well agreed, and no mixture has not been found in any quantity sufficient to warrant a belief that it was intentionally introduced; indeed it is thought that its nature was not understood by the antients. In an analysis of copper ores made in a later period, the proportion in 100 parts was 87-47 of copper to 12-53 of tin, with a portion of zinc so small as not to be worth noticing (Monges, Mém. de l'Instit.); the same may be observed of minute portions of silver that have sometimes appeared in the
couraged his assistants, till overcome by anxiety and fatigue he retired in a raging fever to lie down, leaving instructions respecting the opening of the mouth of the furnace, and the running of the bronze. He had not, he says, been quite very long before one came running to him to announce evil tidings: the metal was melted but would not run. He jumped from his bed, rushed into his studio like a madman, and threatened the lives of his assistants, who being frightened, one of them, as was desired him to give his orders and they would obey him at all risks. He commanded fresh fuel to be thrown into the furnace, and presently, to his satisfaction, the metal began to boil. Again however it appeared thick and sluggish, and tin in vain was thrown, or other alloy added, and other articles of domestic use in his house to be brought to him, which he threw pell-mell on the metal, when it immediately became fluid and the mould was soon filled. He adds that he fell down on his knees, and poured forth a fervent entreaty to Almighty God for the success in which he had crowned his exertions. In the processes above described the metal was allowed to flow at once from the furnace into the channels or ducts of the mould. The stature of Louis XIV., by Girardon, one of the most celebrated sculptors of France, was cast in this manner. The work was a success. The wax which regulated the thickness of the metal being entirely melted out, and the mould fixed in the pit, with the necessary vents for the escape of the air, the mould was then covered, completed above, into a sort of trough or basin. In this were three apertures, closed by plugs, immediately over the chief channel or conduit by which the metal was to be conveyed into the mould. These, by a mechanical contrivance, were opened and closed when the metal had reached at once into the mould. This group was cast entire.

The more modern practice of the English, French, Italian, and German artists does not differ materially in its principle from that of the earlier Italians. Some however use what is called the 'sand-cast,' which is the most generally used. A few observations on the mode practised in Mr. Westmacott's foundry, where the chief colossal as well as other works that have been produced in this country have been cast, may not be misplaced here. The moulds, composed of iron, were first packed with sand, and the castings impressed on them in the usual way on the plaster-cast models. A lining of wax or clay is then made within the mould, of the proposed thickness of the metal. The mould thus lined being then put carefully together, the space or interior is filled up solid with a mixture of plaster and different, &c. It is called the core. The whole now consists of three parts—the mould, the lining of wax or clay (which represents the metal), and the core. When the mass forming the core is set, and fixed with iron and keys to preserve it in its just position, the wax or clay is removed; the channels for distributing the metal and vents for the escape of the air are then made, and the whole being put together is placed in a stove or oven to be dried. When perfectly dry, it is then placed for the mould in a horizontal position. At the lowest point, the slightest damp might occasion fatal consequences by the bursting of the mould when the boiling metal descends into it, the whole is carefully lowered into the pit, and closely rammed down with sand, &c. to prevent its moving; the channels for the metal and the vents for the escape of the air being of course kept perfectly clear. When the metal is ready for running, the mouth of the furnace, which is placed rather above the level of the top of the pit, is opened, and the bronze descends immediately, down the middle of the metal, previous to the above-mentioned sculptor is that used for casting guns [CANNON], to which he adds about 30 per cent. of pure copper, extracting from 3 to 4 per cent. of tin. In modern practice it is not considered important to cast the whole work in one cast. The mind of metal, prepared in the above-mentioned method of sculpturing, renders the jointed portions even firmer or stronger at their point of junction than the general body of the cast.

It has already been stated that bronze for different uses varies in composition. Tin, however, is invariably composed of 100 copper and 11 tin. Bronze for cymbals and tambour is composed of 78 copper and 22 tin; its specific gravity is 8.915. Some cymbals yielded however 80 per cent. of copper. Dr. Thomson found English bell metal to consist of 80 tin 101 zinc 5¢ lead 43

Reflectors for telescopes consist of 66 parts of copper and 33 parts of tin: they resemble steel in colour, are very hard and brittle, and susceptible of a fine polish.

Bronze for medals is formed of 100 copper and 7 to 11 of tin and zinc.

This short history of bronze-casting is purposely limited to its reference to the fine arts; and though, in speaking of celebrated productions or artists, it has been considered right to introduce, incidentally, such particulars of practice as might tend to illustrate the subject, the details of the various processes of modelling, coring, melting, chasing, &c. &c. are omitted, as belonging more properly to founding and casting.

BROOKE, HENRY, is one of the occasionally recurring instances of men of letters who having, from accidental circumstances, enjoyed during life a reputation beyond their merits, afterwards sink into an oblivion so complete, that it might be said to be almost equally undeserved, as was the fate of the same artist in literature, poetry, almost the same as worthlessness. Henry Brooke published his first poem, 'Universal Beauty,' with the approbation and sanction, and even with the direct encouragement and under the patronage of Pope; he was received by him in那 a noble mansion in Chelsea. In a letter of Pope's to Swift, if not written before, the poet was mentioned in one of their class; and his tragedy of 'The Earl of Essex' long ranked, we believe, among what are called stock plays. Yet now the author is all but forgotten; he was not allowed a place in the list of Johnson's poets; and his 'Universal Beauty,' though deformed by awkwardness and even incorrectness of language, admitted for the sake of metre and rhyme, displays considerable imagination and descriptive power, is now, and for years has been, so absolutely unknown, that later poets have borrowed ideas from it without fear of detection.

Henry Brooke, born A.D. 1706, was the son of an Irish clergyman. At Trinity College, Dublin, he was a pupil of Dr. Sheridan, through whom, upon going to London to study the law, he was first introduced to Pope and Swift, who were the promising talents seem to have gained him their favour. After the publication of his great poem he was presented to Frederic Prince of Wales, and received by him as one of the band of men of letters whom that prince considered as powerful agents in his administration. In 1736, when the character Brooke had accused of having written his tragedy of 'Gustavus Vasa,' not merely with a view of exciting and fostering a spirit of liberty, but in order to vituperate the premier, Sir Robert Walpole, the author of this pamphlet was committed to prison by the suspicion has since been indignantly repelled by Brooke's admirers; but it was so universally entertained at the time, that the stage licenser prohibited the representation of the piece, and the author, in consequence, made far more by its publication and sale than he could have hoped from its utmost success upon the stage, to wit, 1000l.

Ill health and the persuasions of his wife, who dreaded and sought to withdraw him from his political connexions, induced Brooke to return to Ireland, where he spent the remainder of his life, and obtained from the Archbishop of Armagh (when vicaroy) the post of barrack-master, which he held till his death. He had a large family, and though possessing, it is believed, no means beyond his official salary and his literary earnings, he generously supported a brother with an equally large family. He thus incurred many inconvenient difficulties, which, together with the loss of his wife, after a happy marriage of 50 years, and of several of his children, so preyed upon his mind, already weakened perhaps by age, as to impair his intellect; and, unfortunately for his fame, he continued to write and to publish after the decay of his faculties had become too apparent. He wrote in all 13 tragedies, of which only 'Gustavus Vasa' and 'The Earl of Essex' could boast any success, many ballads, tracts, pamphlets, and a translation of the 'Helvetic Republic.' His novel of 'The Fool of Quality' was much admired in its day; and his 'Farmer's Letters,' ad-
dressed to his Irish countrymen, are said to have had considerable influence in producing and maintaining the tranquillity of Ireland during the rebellion of 1745. Nor must the fact, honourable alike to both laws, enlightened judgment and to his countrymen, be omitted, that he was one of the earliest advocates for the repeal of the penal laws, at that time in full force against the Roman Catholics. Henry Brooke died in the year 1783. (Campbell’s Speci-
mens of American Birds.)

BROOKLYN, a post-town in King’s County, on the W. end of Long Island in the state of New York, situated in 40° 42′ N. lat. and 74° 1′ W. long., on the shore of East River, the channel which divides Long Island from the city of New York, and which at this part is little more than half a mile wide.

Brooklyn is an incorporated town and contains the private residences of many merchants of the city of New York. The communication between the two places is kept up by steam-vessels which are constantly passing and re-passing the bay throughout the day. The growth of Brooklyn within the present century has been very rapid. The pop., which, in 1800 amounted to 3278, was 4402 in 1810, 7175 in 1820, and 12,043 in 1830. It contains two banking corporations with capitals of 200,000 and 200,000 dollars respectively, and three insurance companies with aggregate capital amount to half a million of dollars: it has also some manu-
factures and trade. Many of the houses are spacious and of handsome elevation, and the view of New York and its bay from the eastern shore of East River is very fine. To the E. of Brooklyn, at Wallabout, is a naval station and a government dockyard which belong to the general government of the U.S. Near Flatbush, to the S. of Brooklyn, a battle was fought between the British and Americans in the revolutionary war. BROOM. [See.]

BROSCUS, a genus of coleopterous insects, according to Latreille belonging to the section of the Carabidae called Simpleximani. In Latreille’s work, however, this genus re-
tains the name of Cephalotes (given to it by Bonelli, from the circumstance of the species possessing an unusually large head), which has been expunged by many naturalists owing to its having been previously used to designate a genus in some other branch of natural history.

The insects of this genus are remarkable for the almost total absence of the inner wings striæ of the elytra. N. pr. species on the elytra. Some, it is observed in the insects of the tribe to which they belong, and for the large and strong mandibles, the elongate form of the body, and the somewhat heart-shaped thorax, which is much attenuated posteriorly. The subcutaneous palp—pala with all their joints of nearly equal thickness, the terminal joint of the maxillary palp short and truncate: the antennæ if extended back-
wards reaching to the base of the thorax: mandibles unidentate internally: labrum entire: anterior tarsi of the max. well developed, and joints of the tarsi equal.

The species are generally found under stones, and often accompanied by fragments of numerous other insects de-
voured by them. When taken in the hand they will often pretend to be dead, extending their limbs stiffly, and it is then with difficulty they can be made to mock at the.

But one species of this curious genus is a native of this country—Broscus cephalotes. It is of a dull black colour, and varies from three-quarters to an inch in length: its form is elongate; the head is nearly equal to the thorax in bulk, and is only slightly smothered with a noticeable sized head, which is being scarcely discernible. It seems to be confined to the sea-
coast, where it is frequently found under stones or rubbish.

In Stephens’s arrangement of British insects this genus is classed among the Harpalidae.

About six or seven exotic species have been discovered.

BROSELEY, a m. t. and par. on the Severn, in the ex-
tensive district called Wenlock Franchise, Shropshire, 13 m. E. from Shrewsbury, 9 m. N. from Bridgnorth, and 130 m. N.W. from London. Its area contains 1550 English statute acres. It is in the 18th century, and 28 persons of both sexes. The market-day is Wednesday; an annual fair is held on Easter Monday. The living is a rectory, united with the rectory of Linley, the gross annual income of which is £300. The pop. of Broseley are chiefly employed in the coal and iron mines of the district. In the Population Returns of 1811 it is stated that ‘the par. of Broseley has experienced a decrease of pop. 515 persons,’ ascribed to the cessation of five iron blast furnaces; 126 persons are employed in mines.’ The par. is divided from Coal-Brooke Dale by the Severn.

Broseley contains three daily schools, four day and board-
ing schools, and six Sunday schools. (Education Returns, 1835.)

A spring of petroleum or fossil tar was discovered here, in 1711, by an inhabitant of the place. This individual heard a noise in the night, about two nights after a remarkable day of thunder. At a boggy place, under a little hill, about 200 yards from the Severn, on digging up a part of the earth, water rose to a great height, and a candle set it on fire. The ‘burning well,’ as it was termed, was shown for several years as a curiosity, until the supply of petroleum failed. The spring broke out again, in 1747, in a similar way, about 10 yards from the old well. About 1752, the spring was cut into by driving a level in search of coal. The quantity of petroleum which then issued was about three or four barrels a day; but in 1797 there seldom flowed more than half a barrel in the same time. In 1803 the produce was about 15 gallons, but, in 1850, a few barrels from Broseley, is a coarse-grained sandstone, highly im-
pregnated with petroleum.

In the par. of Broseley salt is said to have been made from water taken out of pits, still called the Salt-house Pits. (Phil. Trans., vol. xxvii., 1712; Gent. Mag., vol. xxv., 1755, and vol. lxxxvii., 1807; Archdeacon’s Plymley’s (Cor-
et) Survey of Shropshire; Aikin’s Tour, 1779; Eccle-
s. Educ. and Pop. Returns; Boundary Report on Wenlock.)

BROS’UMINUM, a genus of Urticaceae, one species of which is believed to be the cow-tre, or Palo de Vacas of South America. As this however is not certainly ascer-
tained, we refer for an account of that remarkable vegetable production to the article Cow-Tree.

BROS’MIUS, a genus of fishes belonging to the section Subbrachialia Malacopterygii, and family Gadidae. Generic characters:—body elongate, and furnished with a single dorsal fin which extends from near the head to the tail: the anal fin is also of considerable length, and extends from the base to the tail: ventral fins small and fleshy: chin furnished with but one barbule. This genus was established by Cuvier; it is the genus Gadus of Pennant (British Zoology), and Brosmius of Fleming (Brit. An.).

[From R. M. Alcock.]

But one species of brosmius has been found on our coasts, and that appears to be confined to the northern parts; it is the B. vulgaris of Cuvier, commonly called the Torsk, and in the Shetlands the Tusks and the Bismack; in this northern location it is abundant, and when a full or dried, a considerable article of commerce. In Yarrell’s History of British Fishes we are informed that this species also recurs plentifully in Norway, as far as Finnmark of the Faroe Islands, and the W. and S. coast of Iceland, and other parts.

Not having an opportunity of examining a specimen, we subjoin the description of one given by Pennant:—Length twenty inches, and depth four and a half: head small: upper jaw a little longer than the lower: both jaws furnished with a multitude of small teeth; on the chin was a small single beard: from the head to the dorsal fin was a deep furrow: the dorsal fin began within six inches of the tip of the nose, and extended almost to the tail: pectoral fins small and rounded: ventral short, thick and fleshy, ending in four cirri: the belly, from the throat, grows very prominent: anal fin long, and reached almost close to the tail, which is small and circular: colour of the head dusky: sides and back yellow, belly white, edges of the dorsal, anal, and caudal fins white, the other parts dusky: pectoral fins brown. We are only enabled to add, that this description seems to agree well with the characters of the fish as given by other authors. For further information we refer our readers to Mr. Yarrell’s work before cited.

BROTHERS, RICHARD. The birth and early years
of Brothers are not well known; nor indeed would the events of his after life deserve to be remembered, if his ravings had not exercised a considerable influence on his contemporaries, and thus connected his history with that of the world, which is the subject of this chapter.

Richard Brothers held for several years the rank of lieutenant in the British navy, where he quoted in 1789. A controversy with the lords of the Admiralty about his half-pay first developed that character of his mind, which ultimately ripened into a complete delusion. With respect to taking a certain oath in order to qualify himself to receive his pay, he sent a well-written letter to Philip Stephens, Esq., of the Admiralty, dated September 9th, 1790, which appeared in the Public Advertiser at the time. In this letter he exposes the enormities of the practice, and declares his determination never to swear that he takes a certain oath voluntarily, to which he may have an unconquerable objection. The absurdity of this practice he made so apparent, that the earl of Chatham had the word 'voluntarily' erased from the form of the oath. This he afterwards endured, proved that the man was no impostor, but that he deceived others no more than he did himself, being firmly persuaded that his mission was from heaven. He affirms, in a book which he published in two parts, entitled 'The Oracle of the Deity, in which he proves that God is the supreme power of the universe,' which was eagerly bought by all classes, both in town and country. —'It is from visions and revelations, and through the Holy Ghost, that I write this book for the benefit of all men; this book will, if I am mad, am an impostor, have a devil, or am out of my senses, constitutes the dangerous sin of blasphemy."

From the year 1790 Brothers dates his first call, and soon after entered on what he considered his mission. On the 12th of December, in the presence of the King, the Duke of York, the Duke of over, and Mr. Sharp, a man of talent, he was to be delivered up to him, he was committed to Newgate, where, if his statement be true, he was treated with great cruelty. But imprisonment did not damp his ardour. On his liberation, he continued what he denominated his mission; and, after the action of the French Revolution, the robberies of the French revolutionists, and the failure of the baton, were the result of his mission. The first notice of the breach of faith was in the year 1796, when the French army was restored—an earthquake to swallow the parliament when sitting, and great part of London. America to go with England—France to lose her West Indian islands. The cardinals to quarrel, and Rome to be overthrown by an earthquake, &c.

Brothers, when in London, resided for some time at 5, Beaufort-buildings, Strand, and afterwards at 57, Paddington-street, where he wrote his prophecies. He was unassuming in his manners, careful not to give personal offence, and courted neither too much nor too little; his happiness in the complete conviction that in due time all his prophecies would be accomplished.

BROTIER, GABRIEL was born at Tannay in the Nivernois, Sept. 5, 1733, and received the appointment of Physician to the King of Louis XV. at the age of 26. He was educated among the Jesuits, where he was educated. On the suppression of that order he lived in privacy, and devoted himself to literature. In 1781 he was elected member of the academy, and died in Paris, Feb. 12, 1789. His original works hardly deserve notice; and it is upon his editions of Tacitus that his reputation is chiefly founded. The Paris editions, 4 vols. 1771, and 7 vols. 1776, differ considerably from each other, but in the English editions the two are incorporated. Brotie published also an edition of Pliny's 'Natural History,' in 6 vols. 1772, the revised edition of Pliny, 1789, and Amyot's translation of 'Plutarch's Lives,' in 22 vols. 1783, revised and republished in 25 vols. 1801.

BROTULA, a genus of fishes, of the order Subbranchial Malacopterygi and family Gadidae, chiefly distinguished by the dorsal and anal spines being of the caudal and forming one fin, which terminates in a point. The only species known (B. barbatus of Cuvier) is from the Antilles.

This genus is closely allied to Brosnita.
BROUGH. [WESTMORELAND.]

BROUGHON ARCHIPELAGO is a cluster of rocky islands in the Pacific Ocean to the E. of New Zealand, between 44° and 45° S. lat., and 180° and 182° E. long.; it consists of a great number of small islands and islets, and a few of moderate size. The largest is Chatham Island, and next to it Pitt's Island and Cornwallis Island.

BRONCKER, or BRONNER, WILLIAM, Viscount Bronner of, Castle-Lyons in Ireland (which title was created in 1585) and who had been in the office of Muster of Munster in 1645), was born about 1650. In 1646 he was made Doctor of Physic at Oxford. In 1660, having then succeeded his father, who died in 1645, he subscribed the declaration issued in April by the friends of the restoration. In 1660 and 1668 he was named President of the Royal Society in the charters of incorporation then granted; which office he held for 15 years. He was also chancellor of the Queen, a lord of the admiralty, and master of St. Catherine's Hospital. He died April 5th, 1684.

Lord Broncker was a mathematician, and is the author of two remarkable discoveries. He was the first who introduced continued fractions, as follows. When Wallis was engaged upon the interpolation which led him to his well-known theorem on the quadrature of the circle, he applied to Lord Brourell to ask the question; and the latter arrived at the following conclusion, if \( r \) represent the ratio of the circumference to the diameter, then

\[
\frac{4}{\pi} = 1 + \frac{1}{2 + \frac{9}{2 + \frac{25}{2 + \infty}}}.
\]

This theorem was first given by Wallis (Arith. Inf., Works, vol. i. p. 469) with a demonstration, the heading of which is so ambiguously worded, that we are left in doubt whether it was his own demonstration, or his own account of Lord Brooncker's. Montucler states the first in one place, and in another ('Hist. Math., vol. ii. p. 355).

Broncker was also the first who gave a series for the quadrature of a portion of the equatorial hyperbola ('Phil. Trans.', 1668, No. 34). There is also a paper of his (1673, 'Phil. Trans.') in which he shews how to discover the discovery of the Neumann parabola; and another (to which we cannot find the reference) on the recoil of guns. Some letters of his to Archbishop Usher are at the end of R. Parr's life of the latter; and some to Wallis, in his 'Commensuratio Epistolicum' (Prop. 17, &c.).

BROUSONNETIA, a dicotyledon tree, from whose inner bark the Japanese and the Chinese have manufactured a kind of paper and the South Sea Islanders the principal part of their clothing. The only known species forms a small tree with soft, brittle, waxy branches, and large, hairy, rough leaves, either heart-shaped and undivided, or cut into deep irregular lobes. Some of the individuals are sterile, others fruitful. The flowers of the sterile trees grow in a cluster, but into one after a year and a half, and are pollinated by the pollen; these catkins are composed of little greenish-purple membranous calyces, each seated in the axil of a hairy bract and containing four elastic stamens. The flowers of the fruitful trees are collected into round green heads, and consist of a calyx like that of the sterile tree, with a small simple pistil occupying its centre, and having a long downy stigma. The heads gradually push forth little oblong greenish bodies, which are the ripening fruits, which at maturity have a bright scarlet colour, and are of a pulpy consistence, and a sweetish taste, which is bitter and dry; one of its qualities is the great virtue it has in producing the discovery of the Neumann parabola; and another (to which we cannot find the reference) on the recoil of guns. Some letters of his to Archbishop Usher are at the end of R. Parr's life of the latter; and some to Wallis, in his 'Commensuratio Epistolicum' (Prop. 17, &c.).

Broussonetia papyrifera, or the paper mulberry, as it is usually called, is not uncommon in the shrubberies of this country, where it proves perfectly hardy; but it is liable to be broken by winds, and soon becomes an unsightly object. It produces leaves like that of many other trees, but are soft, spongy, and of no value. In the tenacity of the woody tissue of its liber or inner bark it also corresponds with the general character of that order. It is from that part that the 'pharmaceutical' bows and arrows have been obtained by the Chinese.

James Smith gives the following abridgment of Kempfer's account of the preparation of paper from its bark by the Japanese. 'For this purpose the branches of the present year, after the leaves are fallen, in December, are chosen, and the trees are cut down. They are boiled in the bark shrinks and is easily separable from the wood, which is then thrown away. The bark being dried is preserved till it is wanted. In order to make paper it is soaked for three or four hours in water, after which the external skin and the green internal coat are scraped off; at the same time the stronger parts of the pieces are selected, the produce of the youngest shoots being of an inferior quality. If any very old portions present themselves they are, on the other hand, rejected as too coarse. All knotty parts, and every thing which might impair the beauty of the paper, is removed. The remains are then ground strong; if strong, but deficient in strength and solidity. Upon the various degrees and modes of washing the pulp, much also depends as to the quality and beauty of the paper. Mascage obtained from boiling rice, or from a root called Ormum, and some of the mallows tree, is after, carried to the pulp. The paper is finished much after the European mode, except that stalks of rushes are used instead of brass wires.'

BROUWER. [Brovwer.]

BROWN, CHARLES BROCKDEN, the first eminent American novelist, in point of time, was born at Philadelphia in 1771. From childhood he manifested an engrossing love of study. He chose the law for his profession, but took a distaste to it, and was never called to the bar. Thenceforward he devoted himself to literature, politics, and arts. His first work was 'Alcune,' a wild series of speculations on the fancied evils of marriage; for which, however, he found himself unable to avail a remedy. 'Wieland,' his first novel, appeared in 1798. It was followed by 'Lowood,' which is a tale of the life of a young girl, 'William Howard,' before 1801; and by 'Jane Talbot,' in 1804. 'Carwin,' and some other unfinished pieces, were published after his death, in 1822. He established two literary journals: 'The Monthly Magazine and American Review,' commenced in 1802, and continued to the end of 1809; and 'The Literary Magazine and American Register,' commenced in October, 1803, and continued five years. In 1806 he commenced a half-yearly work, 'The American Register,' of which he lived to complete 9 vols. He published almost a score of novels, some of which are pedestrian, others ingenious and satirical, and others religious and pious. He was the first who brought into English such authors as Rousseau, Diderot, and Voltaire, and was the most powerful supporter of the French mode of writing. He was the first who brought into English such authors as Rousseau, Diderot, and Voltaire, and was the most powerful supporter of the French mode of writing. He was the first who brought into English such authors as Rousseau, Diderot, and Voltaire, and was the most powerful supporter of the French mode of writing. He was the first who brought into English such authors as Rousseau, Diderot, and Voltaire, and was the most powerful supporter of the French mode of writing. He was the first who brought into English such authors as Rousseau, Diderot, and Voltaire, and was the most powerful supporter of the French mode of writing.
the events of his life, as they are now of little interest. He was born in 1735 at Dunse, in Berwickshire, of parents in very limited circumstances, who designed him for the occupation of a weaver; but a love of learning, which he acquired when a child, he thought might dispose him to study for the church. Accordingly he went to Edinburgh, and while pursuing his own studies, he taught Latin to obtain a livelihood. Having been employed to translate a medical thesis for a friend, and having been recommended to Dr. Cullen, he was admitted to his medical studies, and began to attend the lectures of several of the medical professors of the University, among others, those of Dr. Cullen, who having discovered his knowledge of Latin, made him tutor to his sons. Having completed the requisites for a medical degree, he was enabled to obtain a degree of doctor from the University of St. Andrew's. His improvment habits soon involved him in pecuniary difficulties, and his hasty temper in quarrels with his medical brethren. He imagined that Dr. Cullen did not assist him to the extent he had expected, and he conceived a dislike to his former preceptor and benefactor, which he displayed in a way that he thought would be most annoying and humiliating to Cullen. It is most probable that Dr. Cullen had withdrawn his countenance from Brown on account of his immoral language and conduct. Cullen's system of medicine was then in the highest repute, and Brown conceived the idea of bringing forward a rival system, which would supersede that of his master. Actuated by these motives, he proceeded to frame a system, of which, with the approbation of General Johnson, the system of anatomy should be the basis and recommendation. This was the origin of his Elements of Medicine. The fundamental doctrine of this system was that life was a forced state, only sustained by the action of external exciting agents. The body was endowed, at the commencement of existence, with a certain amount of excitability. If the power or force of the external exciting agents was within a certain limit, the body was maintained in equilibrium, or in health: if the force fell short of a certain amount, the excitability acquired in the body, and produced diseases which he termed asthenic; while the external agents, if in excess, exhausted the excitability too rapidly, and produced asthenic diseases. The means of remedying these diseases were in accordance with his system. He made few drugs, but he employed, and confined himself to two—alcohol in any of its forms, as wine, brandy, &c., as a remedy for the one set of diseases, and opium for the other. He kept the students, but the fatal results which followed the application of these doctrines to practice brought discredit upon them in Edinburgh; and their author, hoping for greater success, removed to London, where he died of apophlegm in 1756. Brown, however, possessed distinction and fortune, which he expected. His system never found much favour in this country, except among a few whose minds inclined them to the adoption of hasty generalizations, such as Dr. Beeldoes, who edited an edition of the Elements of Medicine, 2 vols. 8vo. London, 1795, with a life of Brown prefixed. His whole works, with a more ample life, were published by his son William Cullen Brown, 3 vols. 8vo. Lond. 1804.

Brown's doctrines met with a more general reception in Germany and Italy; in the former country they were propagated by a writer who claimed them as his own. Rakov made them known in Italy, and at first believed them to be well-founded, but experience convinced him of their inaccuracy, and he subsequently renounced his belief in them. 

BROWN, THOMAS, son of the above, died at Kirkcudbright, 29th of January, 1776, at the instance of the parish of Kirkmabrook, in the Stewart of Kirkcudbright.

About a year after her husband's death Mrs. Brown removed with her family to Edinburgh. Before he was three years old Thomas prevailed with his mother to return with him to Kirkmabrook; but, when he was seven years old, having left school, he was induced by a desire of obtaining a place in a family to return to Kirkcudbright. He was then about six years old. He was placed in the family of the Black family of Blackhall, at Kirkcudbright. He was placed in the family of the Black family of Blackhall, at Kirkcudbright. He was placed in the family of the Black family of Blackhall, at Kirkcudbright. He was placed in the family of the Black family of Blackhall, at Kirkcudbright.
and they were soon after joined by Lord Webbe Seymour, Horner, Jeffrey, Smyth, Gillespie, &c. This society gave rise to the 'Edinburgh Review,' to which Brown contributed two or three articles in the beginning, but owing to some difference of opinion on a point of connexion with it ceased. The first article in the second number is by Brown, on the 'Philosophy of Kant;' a subject of which he knew very little. All he knew of Kant's doctrines was derived from a fantastic French account of them; and though acute and just remarks occur in his critique, it is as bad as his preparation of writing it was imperfect.

A few months after taking his degree Brown published two volumes of poems written while he was at college. They pleased, it is said, the ladies and great people whom they praised; but poems on the 'Sun,' the 'Moon,' 'Pursue of Love,' and the 'War Fiend,' attracted little notice from any one else.

In pursuance of a system they had long adopted, the high church party, on the promotion of Professor Playfair to the chair of Natural Theology in the University of Edinburgh, determined to elect a clergyman to the chair of Mathematics, although the superiority of Mr. Leslie, the lay candidate, was incontestable. The approbation which this gentleman, in a note to his 'Essay on Heat,' had expressed of Mr. Leslie's doctrine of heat, was made the ground of a charge of infidelity. Brown published a pamphlet on the occasion, in which he proved that no such consequences flowed from the doctrine. The 'Edinburgh Review' alluded to the pamphlet in the most flattering manner, and that Brown was the most probable candidate in the north of Scotland for the chair of Mathematics.

A second and considerably enlarged edition was published in 1806, and in 1818 a third, in which the work was improved and matured; the fourth and last edition of this excellent work was published in 1835. The peculiar cause of causation which it contains is this: "A cause is that which immediately precedes any change, and which existing at any time in similar circumstances has always been and will always be immediately followed by a similar effect. The causes of the variation of antecedence in the past and future sequences supposed, are the elements and the only elements combined in the notion of a cause. By a conversion of terms we obtain a definition of the correlative effect; and power is only another word for expressing abstractly and briefly the antecedence itself, and the invariability of the relation. The words property and quality admit of exactly the same definition, expressing only a certain relation of invariable antecedence and consequence in changes that take place on the mind, and are a species of the latter. This is a difference, that property and quality as commonly used comprehend both the powers and susceptibility of substances—the powers of producing changes and the susceptibility of being changed—and with this difference only, power, property, and quality are terms exactly synonymous. Water has the power of melting salt; it is a property of water to melt salt; it is a quality of water to melt salt: all these varieties of expression are synonymous. When water is poured upon salt the solid will take the form of a liquid, and its particles be diffused in continued combination through the mass. When we speak of all the powers of a body we consider it as existing in a variety of circumstances, and every time all the circumstances may be in these circumstances, its immediate effects. When we speak of all the qualities of a body we mean nothing more and we mean nothing less. For an estimate of this doctrine see Causation.

Brown had a very unusual success; he convinced on one point the person at whom it aimed. On the question whether even after experience we are able to infer the relation of cause and effect as to the phenomena of the nature of matter, the composition of forces, and such like subjects, Professor Playfair declared himself completely convinced by his arguments.

In 1806 Dr. Brown became the partner of the eminent Dr. Gregory in his large practice. But his bias was to a literary life. In 1799 he was a candidate for the Rhetorical chair in the University of Edinburgh, but was defeated. In both cases unsuccessfully. Owing to the decline of his health Mr. Stewart required a substitute in the Moral Philosophy class who could read lectures of his own. This Brown undertook, and lectured for a short time in session 1808-9. A similar request in the ensuing session led him to deliver a series of lectures, which were honoured by the attendance of many distinguished members of the bench, bar, and pulpit. When Mr. Stewart resumed his lectures, Brown took a seat in the lecture-room, and in the opening of their number to congratulate him on his recovery, and express their admiration of his substitute. Stewart, anxious to have Brown with him in the chair as assistant and successor, personally solicited every member of the town-council in his behalf, and according to the express instructions of Dr. Gregory, Professor Playfair, and Lord Meadowbank he was elected in May, 1810.

Devoting himself to the cultivation of his health by air and exercise during the vacation, Dr. Brown made no preparation for the labours of the winter. He seldom began to write his lectures until after tea on the evening before the day on which he was to deliver them; he then wrote until two or three o'clock, slept a few hours, and resuming his work, wrote until twelve, when he hurried off to his class. Light reading or a walk occupied the time until the recommencement of this routine. His lecture and theory of avarice were begun after one o'clock in the morning, and finished before twelve next day. Under colour of disagreeing with Dr. Reid he covered his differences with Stewart, his colleague. Nearly all the lectures contained in the first three volumes were written during his first session, and all the rest in the next. They have been published almost verbatim. The following are the more important of the peculiar and new opinions which they contain.

In physics he expressed a great anxiety to discover the parts of which bodies are made up, or to ascertain the changes they undergo—the elements which compose them, and their causes and effects in relation to each other. Bodies which, in relation to our sight, are one, and which the author considers as two, are only simple because we cannot see the spaces which intervene between the corpuscles of which they are made up. What we can now perceive only by means of chemical and mechanical decomposition, finer powers of perception would perceive without decomposition. The author also argues, and justly, that we can see the second object of physical inquiry—the changes of bodies—in the relations of the parts to each other, and of the whole to other bodies; and on this point reason is equally incapable a priori of assisting us. More we can never know of any substance than the parts of which it is compounded, and the changes which it undergoes.

Every one will admit that the changes of the mind are as capable of investigation as the changes of a material object; but some will not see so readily how the mind is also divisible into parts, and that these parts are analogous to the elementary parts. But the inquiry is not into the parts and changes of the mind itself, viewed as a substance, for this is quite inscrutable; the object of investigation is thought, which being both changeable and complex, may be examined in respect of both the causes of its changes and the parts of its combinations.

The phenomena of mind, which may be considered either as successive or complex, as causes and effects, or as subjects of analysis, are the qualities, states, or affections of the mind of which we are conscious, such as perception, memory, reason, and emotion. Since the states of the mind are made known by consciousness, and relate to itself, a consideration of them involves an examination of consciousness and personal identity. Consciousness is a general name for the states of which the mind consists. The supposition of the existence of the mind in two separate states, sensation and consciousness, at the same moment, is absurd. The proposition, 'I am conscious of a sensation,' involves, besides the feeling of the sensation, a reference to self. When it means a present feeling, it adds to it a retrospect of some past feeling and the relation of both to the mind. Belief in our personal identity resolves into intuition.

Brown divides the states of mind, according to his supposed, internal and external states or affections; the external are the perceptions or sensations of bodies affecting the senses; the internal affections he subdivides into two great classes, the intellectual states and the emotions.

Reid defines perception to be the feeling of the organ of sense and the intellectual sense to be the reference of this feeling. In opposition to this, Brown maintains that the sensation is referred to its object by the power of association, and not by a peculiar mental power.
The intellectual states he divides into two generic capacities, simple and relative suggestion. Simple suggestion is that which gives rise to the successions and connexions of ideas and emotions, which occur according to certain primary and secondary laws. The primary are resemblance, contrast, and nearness in time or place; the secondary, by which the former are modified, are, 1st, the length of time of resemblance; 2nd, degree of liveliness; 3rd, frequency; 4th, recurrence; 5th, existence; 6th, original constitutional differences; 7th, differences of temporary emotion; 8th, changes on the state of the body; 9th, general tendency produced by prior habits.

The faculty of conception, memory, imagination, and habit, he reduces to Perthampton’s laws. The arguments by which he resolves memory into simple suggestion are these:—remembrances are conceptions of the past; the state of mind is complex; the conception and its relation of resemblance to the present time; conceptions and suggestions are the same, Annales, which he put in operation on account of memory in time, attributable therefore to the capacity of relative suggestion. When combined with desire, perception becomes attention, and memory becomes recollection, and a similar difference is produced on the phenomena of imagination, as it occurs with or without desire.

Imagination without desire is reverie, and with it, combined with simple suggestion and the feeling of relation, all its phenomena are produced. Habit is suggestion and nothing more, and the increased tendency to certain motions by repeating them is explained by its primary and secondary laws.

Relative suggestion is the feeling which arises in the mind when two or more objects are perceived or conceived, with the relation of the Quam in relationes, and the Nomina in connection. The relations which do not involve any regard to time he subdivides according to the notions, 1st, of position; 2nd, resemblance or difference; 3rd, of degree; 4th, of proportion; 5th, of comprehensiveness or the relation of the whole to its parts. The individual resemblance is the source of classification and definition. The process of reasoning he defines to be the succession of analyses. Judgment, reason and abstraction are reduced to relative suggestion.

Brown finished his 'Paradise of Coquettes,' which he had begun six years before. It was published anonymously in London. Anxious to learn its fate, he came to London, and was received into the society of the principal persons connected with the Whigs in politics. The poem was reviewed in some of the reviews as the production of a noble author of political eminence. In the winter of 1815 he published another volume of poetry under the name of 'The Wanderer in Norway.' After the rising of his class he generally spent the summer in some rural retreat in New England, and his 'Spring in the Air' appeared in the autumn of 1816. In 1817 he gave his opinion on a case of great difficulty,—the accusation of child-murder brought against a woman who was born deaf; and in the summer, while living at the house of Belmaclaine, he wrote his 'Scriptures of Spring,' which was published in 1819.

In the end of autumn, 1819, on his return to Edinburgh, in high health and spirits, being anxious to publish outlines of his lectures, he engaged in the preparation of them with great labour. After Christmas he felt unwell, and was other wise, but he died suddenly on the 11th of April 1819. His illness increasing, his medical advisers recommended him to take a voyage to London. He died at Brompton, near London, in 1820.

Brown’s metaphysical genius was of the highest order, and the possession of that essential faculty, the power of analysis, in a higher degree than any other philosopher of this country. His style is bad in the estimation of persons of chastened taste; but its very exuberance has given such a degree of popularity to his lectures that they have preserved more of his orations than any other public speaker. His methodical and analytic nature had the good fortune to find a biographer in Dr. Johnson, whose memoir we shall do more than compress. Brown was born in St. Michael’s, Cheapside, October 19, 1605: during his childhood his father (a merchant of ancient family at Upton in Cheshire) died, leaving him what in those days was considered an ample fortune. He was educated at Winchester, and afterwards entered as a gentleman-commoner at Broadgate Hall (now Pembroke College), Oxford. Having graduated, he entered on the study of medicine, and practised for a short time in Oxfordshire. He then visited Ireland with his father-in-law, who had some public employment in the inspection of the fortifications of that country; and after having rambled through France and Italy he took the degree of Doctor of Medicine in 1646. The ‘Religio Medici,’ which appeared surreptitiously in 1642, is supposed to have been written about seven years before, on his return to London from the Continent. It had great success, and was translated into Latin, Italian, German, Dutch, and French. In 1646, with the Duke of Buckingham, he having obtained considerable practice was in the next year incorporated Doctor of Physick at Oxford. Notwithstanding very ungodly opinions advanced in the ‘Religio Medici,’ he married a lady who is described as both beautiful and attractive. Miss Ingram, a daughter of the folk family, bore him ten children, of whom a son and three daughters survived their parents. In 1648 he published with his name a work evincing most extensive learning and observation, and on which his name is principally founded: ‘Inquiries into Vulgar and Curious, and Informed Wit.’ It was a Letter on six editions in 27 years. A reply to it was attempted by Alexander Ross, a great lover of the marvellous. It was immediately translated into Dutch and German, and in later years into French, Hebrew, French, and Latin. The ‘Inquiries’ was a complete with antiquarian knowledge, and occasioned by the discovery of some antiquities in Norfolk. To this work was added a much more fanciful essay, entitled ‘The Garden of Cyrus, or the Antiquity of the Quakers.’ In 1650 he published a Letter to Mr. Hawks and Falconey, Antient and Modern.’ He was one of the Antients, artificially, naturally, and mystically considered.

So imbued was Browne with respect for his fx vourite figure, that an incautious reader (to use the powerful language of Johnson) ‘would imagine that decuswas was the great business of his world and that patch, and art had no other purpose than to exemplify and imitate a quincunx.’ These were all the works published in his lifetime. Two collections of posthumous tracts found among papers transcribed and corrected by his own hand contain the following titles:

1.‘Observations on several Plants mentioned in Scripture.’
2. ‘Of Garlands, and coronary and garland Plants.’
3. ‘Of the Fishes eaten by our Saviour with his Disciples after his Resurrection from the Dead.’
4. ‘Answers to certain Queries about Finches and Birds.’
5. ‘A Letter on Hawks and Falconey, Antient and Modern.’
6. ‘Of the Cymbals of the Hebrews.’
7. ‘Of Ropetie or gradual Verses.’
8. ‘On Languages, and particularly the Saxon Tongue.’
9. ‘Of artificial Hills, Mounts, and Barrows in England.’
10. ‘Of Theocritus, and the Oracle of Apollo at Delphos to Crousus King of Lydia.’
12. ‘A Prophecy concerning the future State of several Nations.’
13. ‘Museum clausum sive Bibliotheca adscendit.’

The above were published in one volume folio, together with works acknowledged by Browne himself, by Archbishop Tennyson in 1684; to which were added in 1722 in 8vo. Repertorium, or some Account of the Tombs and Monuments in the Cathedral of Norwich. Other pieces by Browne were published by his son in 1700. ‘1. An Answer to Sir William Dugdale’s Inquiries about the Fen.’ 2. ‘A Letter concerning Ireland.’ 3. ‘A Letter concerning the Ursi newly discovered.’
4. ‘Short Strictures on different Subjects.’
5. ‘A Letter to his Friend,’ and in the Biographia Britannica is inserted a Letter containing Instructions for the Study of Physic.

In 1655 Browne was chosen honorary member of the College of Physicians of London, being, with others, made a freeman and themselves in their volume a Virtute et litteris ornatissimius. Charles II. knighted him in 1671 at Norwich, where, after a short illness, he expired on his birthday, 1662. He was buried in the church of St. Peter Mancroft, in that city, and a short and unpretending Latin inscription on a murr table on the south pillar of the altar records his memory. His surviving son, Edward Browne, published an account of his own travels in Germany and Turkey, and practised as a physician with much reputation during and subsequent to the reign of Charles II.

The life of Browne by Dr. Johnson was prefixed in 1756.
to a second edition of 'Christian Morals,' 12mo, which first appeared in 1716 printed from the original correct MS. of the author by John Jeffery, D.D., archdeacon of Norwich. This edition, which he dedicated to his father, in the belief that he had had a great influence on the style of Dr. Johnson. It is a style too peculiar and idiosyncratic ever to be generally liked, but Browne wrote at a time when our language was in a state of transition, and had scarcely assumed any permanence. The effect of this is still apparent in his writings, which may be answered that it would be difficult to substitute adequate English words for those which he has employed, and that he by no means seeks to give false elevation to a mean idea by sounding phrases, but that he is compelled, by the form, which had his origin from the unconscious apprehensions of the East, to express ideas. It is only possible to read it without acquiring a strong conviction of the author's sincerity. In the summer of 1800 Mr. Browne went by way of Berlin and Vienna to Trieste, where he embarked for the Levant. After seeing a great portion of Greece and Turkey he proceeded by a land journey from Constantinople to Adrianople, whence he went to Cyprus and Egypt. In 1802 he visited Salonika, Mount Athos, Albania, the Ionian Islands, and then went to Venice. In 1803 he carefully examined Sicily and the Lipari islands, and then returned reluctantly to England. Of this extensive and interesting tour he himself never published any account, but seven years after his death some curious extracts from his journal were included in Mr. Walpole's 'Memoirs relating to European and Asiatic Turkey.'

After a long interval of repose Mr. Browne resolved to penetrate to the Tartar city of Samarcand and the central regions of Asia. He left London for Constantinople in the summer of 1812: at the end of that year he went from the Turkish capital to Smyrna, which city he left in the spring of 1813 to resume his journey. Accordingly he left England towards the close of 1791, and arrived at Alexandria, in Egypt, in January, 1792. After visiting the Oasis of Siwah (the antient Ammonium), he returned to Alexandria in the month of April. On the 25th of June he arrived at Esna, where he diligently studied the Arabic language and cultivated the habits by which he made himself so familiar as to pass for an Arab even among Arabs.

In September, 1792, he started for Abyssinia, but a Mamblik, or nomad, in an ill humour, prevented him from getting farther than Assosan (Syene) and the first rapids of the Nile. On his return down the Nile he turned off at Kenne, and visited the immense quarries near Cosseir, on the Red Sea.

In the month of March, 1793, Mr. Browne set out from Egypt with the great Soudan Caravan (Caravan of the country of the Negroes), whose destination was Dar-Fur, a Mohammedan country west of Abyssinia and north of the great western branch of the Nile—the Baher-el-abiad, sometimes called the White River. He hoped to penetrate in this direction into Abyssinia; and the novelty of this route into the interior of Africa, and the circumstance that Dar-Fur had never yet been visited by a European traveller, were in themselves very strong inducements. After many hardships and exposures, which annoyed the caravan, the Mamblik, prepossessed with the idea of catching him from getting farther than Assosan (Syene) and the first rapids of the Nile. On his return down the Nile he turned off at Kenne, and visited the immense quarries near Cosseir, on the Red Sea.

In the month of March, 1793, Mr. Browne set out from Egypt with the great Soudan Caravan (Caravan of the country of the Negroes), whose destination was Dar-Fur, a Mohammedan country west of Abyssinia and north of the great western branch of the Nile—the Baher-el-abiad, sometimes called the White River. He hoped to penetrate in this direction into Abyssinia; and the novelty of this route into the interior of Africa, and the circumstance that Dar-Fur had never yet been visited by a European traveller, were in themselves very strong inducements. After many hardships and exposures, which annoyed the caravan, the Mamblik, prepossessed with the idea of catching him from getting farther than Assosan (Syene) and the first rapids of the Nile. On his return down the Nile he turned off at Kenne, and visited the immense quarries near Cosseir, on the Red Sea.

In January, 1797, Mr. Browne embarked at Damietta for Syria, and in the course of that year he visited Acre, Tripoli, Damascus, Balbec, &c., and then, proceeding through the interior of Asia Minor, arrived at Constantinople on the 9th of December. He returned to London in September, 1798, having been absent nearly seven years. In the spring of the year 1800 he published his Travels in Africa, Egypt, and Syria, from 1792 to 1798. As a writer Browne has no great merits;—he was frequently quaint and odd without being amusing; and not a few occasions he trespassed on delicacy, and he indulged in extravagant paradoxes. One of these he says was the belief that the Latin states of the East were far preferable to those of civilized Europeans, and that they excelled us as much in virtue as they did in happiness. But notwithstanding these blemishes his book contains a great deal of information which was then new and valuable, and it is impossible to read it without acquiring a strong conviction of the author's veracity.

In the summer of 1800 Mr. Browne went by way of Berlin and Vienna to Trieste, where he embarked for the Levant. After seeing a great portion of Greece and Turkey he proceeded by a land journey from Constantinople to Adrianople, whence he went to Cyprus and Egypt. In 1802 he visited Salonika, Mount Athos, Albania, the Ionian Islands, and then went to Venice. In 1803 he carefully examined Sicily and the Lipari islands, and then returned reluctantly to England. Of this extensive and interesting tour he himself never published any account, but seven years after his death some curious extracts from his journal were included in Mr. Walpole's 'Memoirs relating to European and Asiatic Turkey.'
article, 'Had Mr. Browne only worn an English hat he might have gone safely through Persia.' The only public fruits of this last journey are a few short extracts of letters from Mr. Browne to his friend Mr. Smithson Tennant, which were not published until Mr. (Sir) Robert Brown's Own Book of Travels; and Memoirs relating to European and Asiatic Turkey, edited by the Rev. Robert Walpole. (1829.)

BROWN1818, a name given to a religious party which arose during the 16th century. The reformation recognized the principle of independent judgment in spiritual matters; and it was a natural consequence of the removal of the restraints imposed by the church of Rome, that the period in which the liberty of private judgment was first enjoyed was distinguished by the diversity and contrary opinions. In the 16th century contests were perpetually recurring between parties who desired a more complete reformation than yet taken place, and those whose sympathies were connected in some degree with the past, and whose views having been satisfied by the reforms which had already been effected, wished to arrest the religious movement of the age. It was at this period that the Brownists arose; at least we have the authority of Neal and Mosheim for the fact. In Adama's Dictionary of all Religions it is stated that the sects of the Brownists had been professed in England, and churches established in accordance with their rules, before the date usually assigned, and that therefore Robert Brown was not their founder. The writers whom we have named, however, look upon him as the first important and conspicuous figure of the sect together. Neal, in his History of the Puritans, enumerates the leading principles of the Brownists. He says, 'The Brownists did not differ from the Church of England in any articles of faith; but were very rigid and narrow in their modes of worship, and religion. As England to be a true church, and her ministers to be rightly ordained. They maintained the discipline of the Church of England to be Popish and anti-Christian, and all her ordinances and sacraments invalid. They apprehended, accordingly, that the church in the true and strict sense, for the above reasons, was confined within the limits of a single congregation, and that the government should be democratical. The whole power of admitting and excluding members, with the deciding of all controversies, was in the brotherhood. Their church officers, for preaching the word and taking care of the poor, were chosen from among themselves, and separated to their several offices by fasting and prayer, and imposition of the hands of some of the brethren. They did not allow the priesthood to be a distinct order, or to give a man an inordinate estimation. At the same time they would not consent to the name of an officer, and gave him authority to preach and administer the sacraments among them, so the same power could discharge him from his office, and reduce him to the state of a private brother. Every church or society of Brownists met in a place open to the view of the Brownists, a body corporate, having full power within itself, to admit and exclude members, to choose and ordain officers, and when the good of the society required it, to depose them, without being accountable to classes, convocations, synods, councils, or any jurisdiction whatsoever.' (Vol. p. 376. Edition 1732.)

Robert Brown, the founder of the sect, was nearly connected with the Lord Treasurer Cecil. He was educated at Corpus Christi college, Cambridge, and preached some time in the same college. He seems to have derived much of his delivery gained him reputation with the people. He was subsequently a schoolmaster, and afterwards a lecturer at Islington. Neal terms him 'a fiery, hot-headed young man;' and Mosheim, 'an insinuating man, but very unsettled and inconsistent in his views and notions of things.' He went about the country inveighing against the discipline and ceremonies of the church, and exhorting the people by no means to comply with them. In the year 1580 the Bishop of Norwich caused him to be taken into custody, and in 1581 he was in the Tower, where he was released. In 1582 he published a book entitled 'The Life and Manners of True Christians;' to which was prefixed 'A Treatise of Reformation without tarrying for any; and of the wickedness of those preachers who will not reform themselves, till they be driven from their post, be garrisoned, and compel them.' He was again taken into custody, but released on the intercession of his relative the lord treasurer. Four years afterwards he again travelled through various parts of the country preaching against bishops, ceremonies, ecclesiastical courts, ordaining of ministers, &c., for which, as he afterwards boasted, he had been committed to thirty-two prisons, in some of which he died at the stake.

At length he formed a separate congregation on his own principles, being forced being forced to leave the kingdom in consequence of the persecutions which they met with, they accompanied Brown to Middleburg in Holland. Neal observes, that 'when this handsome support was delivered to them, they crumbled into parties among themselves, insomuch that Brown, being weary of his office, returned into England in the year 1589, and having renounced his principles of separation, became rector of a church in Northamptonshire, where he lived an idle and dissolute life (according to Fuller) far from that sabbatarian strictness that his followers aspired after. He had a wife, with whom he did not live for many years, and a church in which he never preached. At length, being poor and proud, he struck the constable of his parish for demanding a rate; and being belched by nobody, the officer summoned him before Sir Rowland St. John, who committed him to Northampton gaol. The decrepit old man, not being able to walk, was carried thither upon a feather-bed in a cart, where he fell sick and died in the year 1630, and 51st year of his age.'

After Brown's death his principles continued to gather strength in England. The Brownists were subsequently known both in England and Holland by the name of Independents.

BRUCE, EDWARD, second son of Edward Bruce of Blairhall, in the county of Elgin, was born about the year 1549; and having passed advocate at the Scottish bar, was early appointed one of the judges of the Commissary Court of Edinburgh—a court instituted soon after the Reformation in the place of the pre-existing Church Courts. He was descended from an ancient Cornish family. In this chair he succeeded Robert, Dean of Aberdeen, who had been also a lord of session, and was superseded, in January, 1576, on account of his 'inhabitability.' The date of Bruce's appointment, however, is, from the loss of records, uncertain; and it is to be observed that in the rotuli archivii, vol. iv., p. 468, there is an entry under the date of 1574, which is thus transcribed: 'Ad Eri. (Eri.)'—we learn that on the 14th July, 1574, Bruce appeared before the Judges of the court of session, and declared, that though nominated Commissary of Edinburgh in the room of the Dean of Aberdeen, yet he would take no benefit therefrom; and, after the Lord George Stewart, and Sir Archibald Grant, and the other lords, had declared that he was not to take a benefit, he withdrew from their favors, and sought to divert himself from their places in the church, and now thought to exclude them also from their places in the state, which the prelates hoped his majesty would not suffer, but would punish as a presumptuous arrogance. Mr. Robert Pont, a presbyterian minister, and one of the commissioners, was stopped in his reply by the king, who will him to be quiet, and present their petition orderly to the lords of the articles, through whom they should be answered. When the petition came before the lords of articles, it was rejected without observation.

In 1594 Bruce was dispatched on an embassy to England—an employment which at that time not unfrequently devolved upon the judges of the court of session or other superior courts of justice to complain of the same sort, given by the solicitor of the Scottish court to Mr. Bruce, and of the harbour afforded him in his dominions; and though Elizabeth refused to deliver up Bothwell as desired, yet, in consequence of the remonstrances of the ambassadors, she commanded him to depart the realm. In 1597 Bruce was named one of the commissioners of the election of the bishop of Aberdeen, by parliament to the king for furnishing ambassadors, and other important purposes; and on the 2nd December same year he was made a lord of session. In 1598 he was again sent to England on the same commission; and in 1600 he was reappointed to the commission for the election of the bishop of Aberdeen, and on the 11th September of the same year he was appointed judge of the court of session.
BRUCE

478

BRUCE

ambassador to England. He failed in securing the main object of his mission, which was to obtain the queen's recognition of his accessions; but his qualities, his skill and address, he gained over many of the English to his master's service. He was once more sent to England in 1601, in company with the Earl of Marlborough, to intercede for the Earl of Essex; but arriving too late for their purpose, the attempt was unsuccessful, and the Earl of Essex was beheaded. He wrote to his friend, Sir Francis Pickering, congratulation on her escape from the consciencers. On this occasion Bruce had the good fortune to settle a correspondence between the kinsmen, which contributed not a little to James's peaceable accesion to the English throne. In reward for these services Bruce was knighted, and created a peer by the style of Baron Bruce of Kinloss; and having accompanied James to England, he was, on 3rd March, 1603, called to the king's council board, and then made master of the rolls, when he resigned his seat on the Scottish council board. He was also made master of the rolls, in 1619, by Sir Edward Phillips, and died on the 14th January, 1611, in the 62nd year of his age. By his wife, who was daughter of Sir Alexander Clerk of Balbirnie, some time Lord Provost of Edinburgh, he had two sons and a daughter. Through the former he was ancestor of the noble houses of Aylesbury and Elgin; and, with the daughter, King James gave 10,000l. with his own hands, as a marriage portion to William second Earl of Devonshire.

BRUCE, JAMES, was born at Kinmonth, in Stirlingshire, the 26th April, 1639. He was the eldest son of David Bruce, Esq., of Kinmonth, and of Marion Graham, of Airth. When eight years of age he was sent to London to school, and after three years he was removed to Harrow, where he remained till 1716. At Harrow he became acquainted with David Hume, and made their friendship the life-long object of his affection. On his return to Scotland he was entered, by his father, at the University of Edinburgh, to study the law, in which he made but little progress, and he shortly after removed into the country on account of his health. In the country he found much more agreeable employment, and his studies were taken up with reading, and he was a good marksmen. In 1753 he set off for London with a view to obtain leave to settle in India as a free trader. In London he made the acquaintance of Mrs. Allan, the widow of a wine merchant, whose daughter he soon after married, and became a partner in the business after two months. In 1757, before his marriage his wife died; Bruce however continued for some years in the partnership, and, in 1757, he made a journey through Portugal, Spain, France, and the Netherlands, partly on business and partly for his own information. Some of his remarks on those countries are quoted in his life, by Dr. Murray, from Bruce's MS. journals. His father died in 1758, and Bruce returned to England to succeed to the family estate, with a moderate income, which, however, he increased by business. His education was increased in consequence of the establishment of the Carolina Company. In 1761 Bruce dissolved his partnership in the wine trade. He had for some time past applied himself to the study of Arabian, and had likewise turned his attention to the East India Company. He became engaged in this country, and drawing, under able teachers. By means of his friend, Mr. Wool, the under Secretary of State, he became known to Mr. Pitt, who consulted him about an expedition intended against Ferrol, which however did not take place. At the beginning of 1762 Lord Halifax, at the suggestion of Mr. Wool, appointed Bruce Consul-general at Algiers, with the understanding that he was to visit the interior of Barbary, and make sketches of the antiquities which, according to Shaw, existed there. In a conversation which Bruce had with Mr. Pitt, it was arranged to send the Consul to the Morea, the year 1181, or 66 Hen. 11, and no doubt "Guillaumes de Bourbon, regis cancell.", to witness to the deed of donation by Emile Henry, son of David I. of Normandy to the Bishop of Flushing, for the church of St. George, on the occasion of which he was granted the estate of the monks of Rouen, the church of St. George. Consequently that Dugdale and his followers have erroneously inserted the dukedom of Normandy instead of the dukedom of Rouen; and this, too, fifty years later than their cited authority would direct. Prince Henry, the greater of the duke in question, having died in the year 1180, and some of the Winchester MSS. still persist.

* * *
the medical art. After spending about two years in Syria he proceeded to Alexandria in June, 1768. At Cairo he was introduced to All Bey, the Mameluke chief, whose Coptic minister, Maimer Rish, had conceived a high opinion of Bruce, whom he fancied to be a great astrologer. Bruce had fixed his plan of going to Abyssinia. He met at Cairo Faiz, the bey of Algiers, and who was now Archimandrite under Mark, Patriarch of Alexandria. He also obtained letters from the patriarch for several Greeks who were in high stations in Abyssinia, and from All Bey for the sheereef of Mecca, the mayyid of Constantinople, and the Bey of Mecca. Travelling on, he set off for Upper Egypt, a country which was then far from being accurately known. Whatever interest Bruce's account of Egyptian antiquities which he gives in the first book of his travels might possess at the time, has now passed away into the background of the history of the country; but he corrected several common errors; he confirmed Pococke in fixing upon Monastery as the site of Memphis, and he visited some of the painted tombs at Thebes. From the Nile he crossed the desert to Cosseir, from whence he sailed for Jida in April, 1769; but instead of going direct to Jida he went, according to his own statements, up the gulf to Tor, and thence along the Arabian coast to Jida. He gives his observations on the hydrography of his courses, the position and bearing of the towns and harbours, &c. The number of the ships which, under the different charters of the straits of Bab el Mandeb, have been by some considered as fictitious, and Dr. Murray himself in his correspondence with Salt (Hall's Life of Salt) acknowledged that 'the dates are contrary to their existence,' but yet it is a fact that Bruce sailed once round the coast of Arabia and the southern part of the coast of the Red Sea (Notes on Bruce's Chart in the Journal of the Geographical Society, vol. v) made under the orders of the Bombay government.

At Jida Bruce received every encouragement for his Abyssinian voyage. The Englishman, a Jida, and especially Captain Price of the Lion East Indianam, kindly exerted their influence with the authorities of that place. Mehetel Aga, the minister of the sheereef of Mecca, originally an Abyssinian slave, was well acquainted with Ras Michael, the Bey of Mecca, and at that time the most powerful chief in Abyssinia. At Captain Price's suggestion Mehetel Aga agreed to send one of his confidential servants, Mahomet Gibberiti, a native of Abyssinia, to accompany Bruce in his journey, and he went to Ras Michael, recommending the traveller as an English physician, and of his protection against the nayib of Masowa, a kind of independent chief, whose cruelty and avarice were the dread of strangers. This precaution of Mehetel Aga proved very useful to Bruce.

On arriving at Masowa, Gibberiti went on shore first and dispatched the letters to Ras Michael, after which Bruce was detained several weeks, annoyed and threatened by the nayib, and in some danger of his life. Bruce exhibited his works to the nayib, and in particular his treatise on the tigers of Abyssinia; he obtained his secret by Ahmed, the nayib's nephew, and a better man than his uncle, for whom Bruce had brought a letter from Mecca. At last messengers came to Masowa from the interior, bearing letters from Ras Michael and from Jami, his agent at Aden, persuading the nayib immediately to forward the foreign physician. On the 15th November Bruce left Arkeeko with the caravan, and after crossing the Tarat mountain arrived at Dixin, the frontier town of Tigre. On the 6th December he arrived at Tigre, where the chief was absent on a campaign in Ambra. Bruce was kindly received by the deputy Jami, with whom he remained till the middle of January, 1770. He visited Axum and other places in the neighbourhood, and continuing his journey through Sire and other places he passed through Ambra, a part of the Samen range, and arrived at Gonder about a month before the middle of February. The Ras and the young king were still absent with the army, but Bruce became acquainted with Ayto Ahn, a man of rank and very partial to foreigners, and with his help he frequented the Haggare queen dowager, and afterwards to her daughter Orozoro Esther, Ras Michael's wife, who continued Bruce's constant friend during his residence in Abyssinia.

Bruce remained nearly two years in Abyssinia, which he spent entirely in that division of the empire called Ambra, and in that part of it which borders on the lake Debs, without ever again visiting Tigre. Concerning the physical geography of the country his information is scanty and inaccurate. The southern provinces of Shoa, Efat, &c., he did not visit. The country was in a state of confusion, owing to a civil war between Ras Michael and otherchieftains. The campaign of that year 1770, after beginning unfavourably to Michael's cause, ended by his complete triumph, which was attended by the speedy flight of Abdallah, that clever but cruel chief of Meke. In November of that year Bruce succeeded in reaching the sources of the Abawi, which was then considered as the main stream of the Nile; thus accomplishing what he had from the beginning fixed as his main object of his chief's design and purpose.

As Bruce's narrative of his residence in Abyssinia has been the subject of much controversy, and as doubts of its veracity have been by some carried to an unreasonable extreme, it is well to state here what credible native witnesses who have known him at first hand have had to say of him. Salt, in his second journey to Abyssinia, became acquainted with Dofter Esther, a learned old man, much respected in the country, who, when a young man studying at Gonder, had been intimately acquainted with the inhabitants of Ambra, and, after forty years, still spoke of him in terms of friendly regard. He said that when Bruce first arrived at Gonder, Ras Michael was absent with the army, but that having questioned two Greeks, Sydros Petros and Paulos, who gave a favourable account of him, and that they would like to see him, he was received with great attention. Bruce's reputation was greatly increased by his having cured one of Ras Michael's children, and also Ayto Confu, Orozoro Esther's son by a former husband, of the scurvy. Orozoro Esther, the aged chief, was afterwards taken down by Ayto Ayh, who, finding himself the leader of the country, turned him out of his house. After remaining some time at Gonder, he set out, with the king's permission, to visit the sources of the Abawi, under the protection of Faizi, the governor of Damot and Gonder, who had then made peace with Ras Michael. Bruce went with Balgani, a Christian man, who attended him on his travels. After failing in a first attempt, in which they were plundered, they succeeded in a second, and returned safe to Gonder. Dofter Esther described Bruce as a man of mark, who conducted himself remarkably well on a black horse of his own; the king sometimes lent him a horse out of his stud. Bruce was greatly noticed by the king, and was one of the favourites or favourites at court, Ras Michael was also attached to him, but seldom gave him anything. After residing a little at Ambra he went to a seat partly at a house near Kedus Raphaël, which was given him by the king. Kella Yasous and many other persons of rank in the country were much attached to Bruce, and when the latter quitted Abyssinia, Dofter Esther said 'he left behind him a very great friend in Abyssinia.' But when he arrived in the country, he could read the written characters of their books, but did not possess any great knowledge of the Geez, though in this respect, as well as with regard to the Ambare, he considerably improved himself during his stay. He was conducted on an interpreter of the name of Michael, through whom he generally conversed. He spoke however Arabic with some of the Musulman inhabitants. Bruce never commanded a body of horse, as he stated; the king had no body-guard, though he had a body-guard. Most of the troops were commanded by Idris, a Musulman. Bruce was not actually engaged in war, but he was present at one battle, probably the second battle of Serbraxos. This is confirmed by Bruce's original journals, quoted by Dr. Murray in his edition of the Travels, and which differ immensely from Bruce's text in the narrative. No shummut or district was ever given to Bruce, though he was said to have frequently asked for the government of Ras el Feel, which he had at one time during his residence at Gonder. He was said to have told Orozoro Esther that Ahma Yasous, prince of Shoa, never visited Gonder, and that Bruce's time, all connexion between Shoa and Gonder having been broken off long before. It may be observed here also that in Bruce's original memoranda (see Appendix, vol. iv) there is no mention of this visit as stated in the narrative. The description of the Gallia chief Guangoou, Dofter Esther said was strongly misrepresented; he remembered his visit to Gonder, when
the Gaal was becomingly dressed, as most Galles are when they come to court. With regard to the story of the Worari or plundering parties on a march cutting a piece of flesh from the living animal, Dolter Esther had heard of the practice, and believed it true. In a letter to the author fully described it (Salt's Life and Adventures of Nathaniel Pearce, edited by Hall). On being told of Bruce's disgust at the destruction of Abyssinian banqueters, Dolter Esther said he had never witnessed such practices, and expressed great abhorrence at the thought. He admitted that the levities of the higher orders was carried to much greater lengths in Amhara than in Tigre (see also Peace's Life, and Coffin's account of his excursion to Gondar annexed to it), but said that the scene described by Bruce was certainly greatly exaggerated, and as a proof of its insincerity, he pointed at the drinking of healths, a custom unknown in Abyssinia (Salt's Abyssinia, ch. 8). Such was Dolter Esther's sober statement, the accuracy of which was confirmed to Salt from other quarters, among others by Janni, Ras Michael's deputy, 'who had always spoken of Bruce with great respect' (Salt, ch. 9). Gobat (a recent missionary to Abyssinia) observes that the description of the feast as given by Bruce, 'I admit that such a feast may have taken place among the most shameless libertines, but excesses of that kind are not customary, either as to their cruelty or their indecency.' It is worth observing, that in speaking of the occurrence on the occasion of the marriage, at which Bruce was present, he merely states that 'all the married women ate, drank, and smoked like the men' (vol. iv. ch. 9), but afterwards, in ch. 11, where he assumes to give a general sketch of Abyssinian manners, he alludes to the custom of the feast, but does not say that he ever saw it.

It appears evident from all this that when Bruce composed his narrative, he did not consult or did not scrupulously adhere to his journals, but borrowed largely from his own imagination, especially with regard to the dates, and jumbled together distinct incidents and circumstances, either through carelessness or for the sake of effect. 'He was become old and indolent,' says his friend Dr. Murray, 'I have reason to believe that after nearly twenty years he had eloped since his return from Abyssinia, his tale to his amansuensis resembled more that of an old veteran by his parlour fire-side in a winter evening, than the result of fresh and accurate observation. He wished to be believed that he had seen and done more than he had in fact seen and done, that he had travelled, but performed — a species of ambition seldom reconcilable with fact.' (Hall's Life of Salt.) There are however some points in Bruce's narrative which cannot be accounted for so easily. The Axum inscription, with the preliminary and explanatory notes of Poclemont, seems to me to be the noblest of these [Axum]. He also totally omits throughout the narrative of his journey to mention Balugani, a young Italian artist whom Mr. Lunisidan had engaged for him at Rome, and who had joined Bruce at Algiers, and had been the constant companion of all his mood, who as far as Gondar and the sources of the Nile, had kept his journals, assisted him in drawing, and had been evidently of material use to him. Bruce mentions in his introduction the fact of his having engaged Balugani, and afterwards says no more. It seems to me that the end of his memoirs speaks of his death in a vague manner, as if it had happened soon after his arrival at Gondar, somewhere about March, 1770, and several months before his journey to the sources of the Abassi, and when he adds that Salt 'in a later part of his narrative' speaks of the visit of a European who had ever visited the sources of the Nile, and that he accordingly throws discredit on the accounts of the Jesuits Paez and Lobo, who had described them before him. He also omits in his narrative to mention the fact of three Franciscan friars from the Propaganda having reached Gondar only twenty years before him, where they rose for awhile into great favour, and made several proselytes to Catholicism, among others Bruce's friend Aytio Ayle and the iehee of queen dowager Ayeje (Salt's Abyssinia, vii.). At the end of February, 1744, we find it stated 'that Aytio Ayle had been converted by Father Antonio, a Franciscan, in 1750.' (Salt, ch. 10, and Appendix III., where the journal of the Franciscans is translated from the Italian MSS. and an account of the last Emperor's Joe's body being dismembered, about which there is a palpable inconsistency between Bruce's original memoranda and his printed narrative (Salt, ch. 5). With regard to Bruce's translation of the Annals of Abyssinia, Dr. Murray says in a letter to Salt, 29th of February, 1772: 'The bulk of the facts are true, but they are often misplaced in time and local circumstance. The Portuguese and Abyssinian accounts are blended together, and the whole does not merit the title of an accurate narrative. Bruce often committed blunders in an unconscious way, classic quotations and minute facts of ancient history, which he was not qualified by literary habits to balance and collate.' (Hall's Life of Salt.) The latter part of this remark leads us to observe that Bruce, though he has had a character for learning among those who have none themselves, was very far from being an exact scholar or a really learned man. His dissertations on various subjects show sometimes great ignorance, and nearly always equal presumption and deficient judgment. Such and the dissertations you will find in the Traité d'Abyssinie, in its earliest Ages, on the 'Origin of Characters or Letters,' the 'voyage to Ophir and Tarshish,' and others.

With these numerous defects, Bruce will always rank high among African travelers, as a journey to Abyssinia forms a part of the annals of discovery, for he may be said to have re-discovered a country of which no accounts had reached Europe for nearly a century, and to have renewed our intercourse with it, which has been followed up since by Salt and his contemporaries Burman, and Rüppel. The Ethiopic MSS. which he brought to Europe formed likewise a valuable addition to our literary treasures. A list of them is given in the Appendix to Bruce's Life, by Dr. Murray, 4to, 1808. Bruce's courage, activity, and presence of mind are deserving of the highest praise.

The campaign of 1771 having turned against Ras Michael, and that chief being deserted by his followers, and taken prisoner, the opposite faction got possession of the king's country. They proceeded northwards by the Red Sea, and reached Assouan, where they disembarked, and proceeded to Assouan, and in which he was near losing his life through thirst and exposure. He then went to Cairo, where he was received with much kindness, and entertained as a friend. Taking leave of them, he proceeded by Ras el Feel, Tea, and Beylah, to Sennar, where he arrived in May. Here he was detained till the month of September, and it was with much difficulty he found means to leave that barren country. He proceeded northwards by Her-bagi, Halfay, Shendi, and across the Atbara or Tabacass to Goz, in the Barabra country, and then plunged into the desert, which he was a fortnight in crossing to Assouan, and in which he was near losing his life through thirst and exposure. He arrived at Assouan, in January, 1774, where he found that Sir John Mackenzie had arrived some time at Cairo, proceeded to Alexandria, where he embarked, in March, 1775, for Marseilles. In France he was received with marked attention by the Count de Buffon and other distinguished men. He thence went to Italy, and at last returned to England in June, 1774, after an absence of twelve years.

Bruce was present at court, and the king, George III., received him in a flattering manner; but he obtained no more substantial rewards, except a gratuity for the drawings which he had made in Egypt. After this the story he told in company about the Abyssinians and the Gallas interested his hearers, but at the same time excited envy and ill-natured strictures. Some even went so far as to pretend that he had never been in Abyssinia. Bruce's vanity and disdainful manner were exposed to much ridicule and sarcastic criticism. After some months spent in London, he went to Scotland, where his family affairs were in great disorder owing to his long absence. Upon these he bestowed much of his time, giving up meanwhile all thoughts about
his Abyssinian journals. He married, in May, 1776, Miss Dunias, with whom he lived in quiet retirement till 1785, when, on the death of his wife and his favorite friends, and especially Daines Barrington, he set about preparing his Travels for publication. This work was published in 1790, in five 4to volumes, Travels to Discover the Sources of the Nile, in the Years 1766-73. The attractions of each of these volumes were considerable, and the character of Ras Michael has been particularly admired, and its truth is authenticated by the MSS. of the ‘Annals of Abyssinia,’ vol. v., which includes the history of that chief down to the murder of the Emperor Jos in 1769 (Appendix to Murray’s Life of Bruce, in 4to), as well as by the current report in the country.

Bruce’s work was sharply assailed in the critical journals of the day, especially in the ‘Monthly Review.’ The Rev. Hugh Blair, Daines Barrington, and others, spoke highly in his favor, but to be the exception. He has written and into German by J. Valkna, with notes by J. F. Blumenbach.

Bruce died on the 27th of April, 1754, at Kinnaird, of a fall down stairs as he was going to hand a lady to her carriage. He was buried in the church-yard of Larbert, in the same tomb with his wife.

In 1805 his friend Dr. Alexander Murray published a second edition of Bruce’s Travels, to which he added a biography of the traveller, and copious extracts from his other works. Murray has seized upon the chief instructive and entertaining parts of their correspondence, and the editor’s notes and remarks in the life, the reader is enabled to separate the reality from the fiction or exaggeration which prevails in many parts of the author’s narrative. Mr. Salt’s two memoirs are of more than a supplementary value in this discussion, Dr. Murray entered into a correspondence with Salt, which serves greatly to elucidate the question. He acknowledged that Bruce’s map of Abyssinia was worth little. A third edition of Bruce’s Travels, published in 1815, is still the best edition of the book. The second edition of the previous edition. The preface by Dr. Murray, in which he advertts to Salt’s correction of several of Bruce’s statements, is deserving of attention.

BRUCE, MICHAEL, was born at Kinneoss, in the parish of Fingask, county of Kinross, on the 27th March, 1746. His father was an operative weaver; and, in his religious sentiments, of that class of seceders called Burghers. He had eight children who, having little or nothing to inherit from their parents, were all brought up to rely on their own industry for their support. One of them we accordingly find an operative weaver like his father; but Michael, who was the fifth child, was destined for the office of a minister of the Gospel. To the great body of the people of Scotland that office has long been one of much reverence; and one of the greatest are the duties of a minister of the Gospel. And it is here to this day an object of nearly universal ambition. The strict and religious parents of Bruce partook in the common feeling; and in his devotion to reading from his earliest years, and the anxiety he felt to make himself fit for the profession which he had in view of.

Optimists indebted for the cultivation of his mental powers, Mr. David Arnot, a farmer on the banks of Lochleven, deserves to be first mentioned. He directed Bruce to the study of Spenser, Shakespeare, Milton, and Pope, supplied him with books, and became at once a counsellor and the constant companion of his favorite pupil. David Pearson, of Easter Balgedie, a village in the neighborhood of Kinneoss, a man of strong parts and of a serious and contemplative turn, also contributed not a little to lead him to the love of reading and the study of poetry. In his youth he was one of these two individuals that spent most of his leisure hours while in the country; and soon after his coming to Edinburgh he contracted an acquaintance with Logan, whose congenial spirit made him the intimate companion of Bruce in his lifetime, and his warm elogist and editor of his works after his death. So long as Bruce remained about his father’s house, his wants, which were then indeed but few, were readily supplied; but after his removal to Edinburgh his resources diminished, while his wants, both mental and bodily, increased. He was discontented, and his desires increased in intensity. But poverty was not the only difficulty with which the youthful Bruce had to contend. He had also the narrow prejudices of worthy but illiterate parents, who seem to have regarded general learning as unnecessary, and especially the study of languages, though he did not but feel how unnatural these prejudices were, what injustice they did to those powers and aspirations with which he was endowed and which glowed within him. He was too dutiful a son, however, to give his parents any cause of offense, and accordingly, when about to return home from college, he took the precaution of sending to Mr. Arnot such volumes in his possession as he thought his father would disapprove of. ‘I ask your pardon, says he, in a letter to Arnot of the 27th March, 1783, ‘for the trouble I have put you to, and I have made you no payment. I have sent you a subscription to the works of various writers that have made me take this method. I have sent Shakespeare’s Works, 8 vols., Pope’s Works, 4 vols., and Fontenelle’s Plurality of Worlds.’

It was about the date of this last letter we find, in his correspondence, the first mention of that morbid melancholy which is frequently the attendant on a poetical temperament, and was in him also the forerunner of a fatal disease. In December, 1764, he writes to Arnot, ‘I am in health, except a kind of settled melancholy, for which I cannot account, of which I have had several fits, and which, if I believe, I should fall into a state of stupidity and delirium. I have some evening scholars, the attending on whom, though few, fatigues me, that the rest of the night I am quite dull and low-spirited. Yet I have some lucid intervals, in the times of which I can study pretty well.’ In these letters he refers to his occupation of a schoolmaster, for though only a youth himself he was already a teacher of youth. He spent the winters at school or college, and in the summer he endeavored to earn a small pittance by teaching a school, first at Garney Bridge and afterwards at Forrest Mill, near Alloa.

‘In the autumn of 1766,’ says Dr. Anderson (British Poets, vol. ii. p. 277), ‘his constitution, which was ill calculated to encounter the austerities of his native climate, the exertions of daily labour, and the rigid frugality of humble life, began visibly to decline. Towards the end of the year his ill health, aggravated by the indigence of his situation, and the want of those comforts and conveniences which might have fostered a delicate frame to maturity and length of days, terminated in an illness which, after a long subdu- tion he quitted his employment at Forrest Mill, and with it all hopes of life, and returned to his native village to receive those attentions and consolations which his situation required, and to which there were nothing to be added by the sentiment of friendship. He lingered through the winter, and in the spring he wrote the well-known ‘Elegy’ in which he so pathetically describes his feelings at that time, and calmly anticipates his dissolution.

Of the latter part of the Elegy, part of which is just quoted, Logan says, ‘It is wrought up into the most passionate strains of the true pathetic, and is not, perhaps, inferior to any poetry in any language.’ This elegy, from the circumstances in which it was written, the nature of the subject, and the state of the poet, may be considered as the last effort of popularity. It was the last composition which Bruce lived to finish; by degrees his weakness increased, till he was worn gradually away. His poems are not numerous—for which his early death may well account—but they evince talents of a very high order. They are distinguished for their elegance and harmony; and what is singular, we find

Vol. V.—3 Q
disappointed the powerful lords of the house of Brus; but he had already experienced their friendship, as he had no reason to fear the arge of his enemies in his flight from the English crown, and he was now anxious to foster the submission to his award which their retirement held out. Accordingly in 1295, the same year in which the aged De Brus died, Edward appointed the father of Bruce constable of Dunure, and in 1296 made him subject to Edward; and in 1298 they attended the parliament of Berwick, where they renewed their oath of fealty and submission to him. Even the nobler stand of Wallace did not for some time rouse their patriotism; and when those to whom the forms of the western districts had been committed summoned them to Carlisle, Bruce not only obeyed the citation and swore fidelity to Edward, but to evince the sincerity of his declaration immediately after laid waste the possessions of the knight of Liddesdale, and carried off the English prisoners, and in the year 1298. Scarcely however was this act of violence committed, when he abandoned the English party and joined the national standard, expressing at the same time his hope of absolution from the oath which he said had been extorted from him. A few months afterwards the Scots were obliged to capitate at Irvine; and Bruce, with others, made his peace with Edward. Wallace retired into the northern parts of the kingdom with a few adherents.

The signal victory gained by Wallace at Stirling on the 12th September 1297, was a signal blow to the national standard. He took no active part in the struggle however, but while Wallace and his followers fought at Falkirk shut himself up in Ayr Castle, where indeed, by preserving the communication open between Carrick and the Earldom of Galloway, he hindered the English from obtaining service to the cause. Edward, following up his victory marched into the west with a determination to chastise Bruce, who, after burning the fortress, retreated into the fastnesses of Carrick, and Edward at length directed a strong army against it. Meanwhile Robert de Bruce, the son of the baron, accompanied King Edward I. to Palestine in 1269, and was ever after greatly regarded by that monarch. In 1271 he married Margaret, daughter of Carrick, in whose right he became earl of Carrick, and by whom he had 12 children.

Of these Bruce was the eldest son. He was in the tenth year of the reign of Edward, and the father encouraged him with the other magnates of the realm in a solemn acknowledgment to King Alexander III. that his granddaughter Margaret, the maiden of Norway, was heir presumptive to the Scottish throne. Two years afterwards the king died, and a formal contest ensued to the throne; but in September 1296, parties having now begun to be formed among the nobles with a view to a competition for the crown, Robert de Brus, the grandfather, met several important persons of the kingdom at Turnberry Castle, the seat of his son Robert de Bruce, who, probably from a like motive, had about a fortnight before resigned the earldom of Carrick, which he had held in right of his wife, only deceased, to Bruce, their eldest son and heir, and shortly afterwards, retiring into England, left the administration of the same house to Bruce.

Edward could not but see that his determination had
sealed by both parties and confirmed by their oaths of fidelity and secrecy. Comyn however revealed the matter to Edward, who determined on revenge; and having one evening drunk freely, was imprudent enough to discover his purpose to the nobles of his court. The Earl of Douglas, a kinsman of Bruce, had notice of his friend's danger, and anxious to save him, yet afraid in so serious a matter too rashly to compromise his own safety, sent him a piece of money and a pair of gilded spurs. Bruce understood the meaning, and expressed his determination to proceed out for Scotland, accompanied by his secretary and a single attendant. He is said to have reached Lochmaben Castle on the fifth day after his departure from London, and thence repairing to Dumfries, where Comyn was, he sought a private interview with him. There occurred a story which cast doubt on the part of Comyn, the meeting took place in the convent of the Minoret friars. Here Bruce passionately reproached Comyn for his treachery, and after some altercation drew his dagger and stabbed him to the heart. Immediately hastening from the spot he fled for his safety. The alarm soon became general; and the English judges, then holding a court in a hall of the castle, not knowing the extent of the danger, hastily barricaded the doors. Bruce, assembling his followers, surrounded the castle, and with power and might put all within to flight, and expelled those within to surrender. He soon afterwards proceeded to Scone, the antient seat of Scottish inauguration, and was there crowned king of Scots on the 27th January, 1306. Edward had carried the regalia to Westminster, but refused to accept as his son-in-law. The bishop of Glasgow furnished from his own stores the robes in which Bruce was arrayed; and a slight coronet of gold being got from the nearest artist, the bishop of St. Andrew's set it on his head. The bishop of Glasgow also presented to the new king a suit of apparel purchased with the money which he had concealed in his treasury, and under it Robert received the homage of those who devoted themselves to his service. The ears of Fife had from a remote antiquity enjoyed the privilege of crowning the kings of Scotland; but Duncan, the representative of the family, favouring at this time the English interest, his sister, the Countess of Buchan, with a boldness and enthusiasm which must have added to the popular interest felt for the young king, repaired to Scone, and asserting the privilege of her ancestors, placed a crown on his head. At this time the eyes of all Scotland were now directed towards Bruce. Comyn was no more; and the brave Sir William Wallace had been executed by the English. Bruce was therefore without a rival: he was the heir of the throne, and his past conduct had given able proof of his valor and prudence: he was regarded as the last remaining hope of his country.

Edward heard of the murder of Comyn and of the usurpation of Bruce when residing with his court at Winchester. He immediately despatched a messenger to the pope, to pray the assistance of the holy see; he directed the garrison towns on the Marches to be strengthened; and nominating the earl of Pembroke guardian of Scotland, he ordered an instant levy of troops for that kingdom. Pro- ceeding hither together with his army, he ordered about 300 youths selected from the best families of England, and conferred on them the honour of knighthood amidst a pomp and magnificence well calculated to rouse the ardour of the nation. He made also a splendid banquet in honour of the new-created knights, at which he uttered a solemn vow to execute vengeance upon Bruce and his adherents. Bruce, on the other hand, had prepared no system of offensive warfare nor even of defence; his followers were few, and when he first resolved to assert his claim to the crown, he had neither summand nor aide. St. Andrews, the bailiwick of Lochochain and Kildrummie. He had seen however the success of Wallace in less happy circumstances, and he witnessed an enthusiasm for his person which he knew the prospect of success would kindle into a wide and irresistible flame. Prompted therefore perhaps by the hope of striking an early and effectual blow, he sent a challenge to Pembroke, who had established his head-quar-
prisoners and ordered to instant execution. When Bruce wandered among the fastnesses of Carrick, after the defeat of his auxiliaries at Loch Ryan, his army did not amount to 60 men. His own personal prowess however in an encounter which, were it not for the authority from which it is derived has been found to be generally correct in its other particulars, would be looked upon as fabulous or exaggerated, restored the confidence of his countrymen in the ultimate success of his cause. The people of Galloway, hoping to re-enter their country, under the pretence of joining the party, collected about 200 men, with bloodhounds to track the fugitives through the forests and moors. Notwithstanding the secrecy of their preparations, Bruce had notice of his danger, and towards night withdrew his men to a post on the north of the other a rivulet which had only one narrow ford, over which the enemy must necessarily pass. Leaving his followers to their rest, Bruce proceeded to the ford, where the approaching yell of a blood-hound soon fell upon his ears, folowing which they vanished, and after destroying in this way bloodhounds, true to their nature, led the Galloway men directly to the ford where the king stood, who, fearing the destruction of his whole party should the enemy gain the ford, boldly resolved to defend it alone. The Galloweans, finding that they had been outmaneuvered, turned on the opposite side to dispute their way, the foremost of their number rode boldly forward; but in attempting to reach the other side of the stream, Bruce, with a thrust of his spear, laid him dead on the spot. The same fate was shared by four of his men, who were killed on another side of the ford, apart from the others. Dismayed at so unexpected and fatal a reception, they fell back for a moment in some confusion; but instantly ashamed that so many should be baffled by the prowess of a private individual, returned furiously to the attack. Then the king, however, so valiantly repulsed by the king, that the post was still maintained; and at length the loud shout of Robert’s followers, advancing to his rescue, warned the enemy to retire, after sustaining in this unequal conflict the loss of 14 men. The danger which Bruce had thus exposed, and the bravery which he had manifested on this occasion, roused the spirits of his party, and called many to his standard.

Bruce indeed required all the aid he could receive; for Pembroke, the guardian, was already advancing upon him with a great body of men, having also obtained the assistance of John of Lorn, whose followers were well acquainted with that species of irregular warfare to which Bruce was obliged to have recourse. Lorn had with him a blow, however, but one which was fatal to the post. To this post, and was so familiar with his scent, that if once it got upon his track nothing could divert it from its purpose. This Bruce found to his experience, and well nigh fatally; for having arrived at the place where Bruce and his army lay, the animal was, for a time, at a loss, which in fact was its stratagem that could be devised to elude it, the animal singled him out and led on the enemy in his pursuit, till at length Bruce and his companion (for to these two only had he successively subdivided his men) reached a rivulet, in the middle of which was a strong stone, and the strong scent upon which the hound had proceeded, turned into the adjoining thicket, whence he regained in safety the rendezvous of his followers. Here, having learnt the state of security in which the English had fallen asleep, and the danger in which that Scottish army was now totally dispersed, Bruce collected a few men, and dashing upon a detachment of about 200 of the enemy, put the greater part of them to the sword. Pembroke shortly afterwards with the rest of his whole force, turned towards England, and after another disaster, similar to that just mentioned, retreated to Carlisle.

Bruce, encouraged by success, ventured down upon the low country, and reduced to his obedience the districts of Kirkcudbright and Dumfriesshire, determined again to take the field; and putting himself at the head of a strong body of cavalry, he advanced into Ayrshire, and came up with the army of Bruce when encamped on Loudon Hill. Here, though his army was greatly inferior to the English, and consisted wholly of infantry, Bruce gave Pembroke battle; and so well conducted was the conflict by Bruce, that while the loss of the Scots was extremely small, Pembroke’s whole forces were put to flight, a considerable number being slain and many made prisoners. Three days after this Bruce encountered Montherm at the head of a considerable body of English, whom he also defeated with great slaughter. These successes proved the greatest consequence to Bruce’s cause, which was still further strengthened by the death of the Earl of Carrick, which occurred on the 7th July, 1307, in his progress towards Scotland. With his last breath he commanded that his body should accompany the army in its march, and remain unburied till the country was wholly subdued; but his son, determined to justify his father, led the army to Pelham, in Wiltshire, the king, and that the clergy willingly did homage to him in that character.

Finding at length his authority established at home, and that Edward was sufficiently employed by the dissensions which prevailed in his country, Bruce resolved by an invasion of England to retaliate in some measure the miseries which it had inflicted on his kingdom. He advanced accordingly as far as the bishopric of Durham, lay at war with the king, and that his country with England at a sort of truce, and without entering into open hostilities. Edward at first complained to the pope, but soon afterwards made advances towards negotiating a truce with Scotland. Robert however, knowing the importance of following up the successful career which had been opened him, refused to accede to his proposals, and again invaded England. In the same year also he took various fortunes in his kingdom which hitherto remained in the possession of the enemy. The last of these forresses was the castle of Abercorn, upon which the king of the English now depended, and Edward accordingly collected all his forces for its defence. It was on this occasion the famous battle of Bannockburn was fought, 24th June, 1314 [BANNOCKBURN], when a complete victory was obtained by Bruce. By this event the sovereignty of Bruce was established, and the remainder of his public life was occupied in invading and defending himself from England, in negotiating treaties with that kingdom, and framing laws for the ordering and consolidating the power which he had acquired. In these negotiations Bruce includes between the two kingdoms of England and Scotland a treaty of permanent peace, the principal articles of which were the recognition of Bruce’s titles to the crown, the sovereignty of the kingdom, and the marriage of Johanna, the sister of Edward, to the King of Scotland, to David, the son and heir of the king of Scots.

Bruce did not long survive this event. The hardships and sufferings he had encountered brought upon him a disease, in those days called a leprosy, which the ardour of his enterprise and a natural strong constitution had hitherto enabled him to triumph over. The two last years of his life were spent in comparative seclusion in a castle at Cardross, on the northern shore of the Firth of Clyde, but in occupations every way befitting his high station. He was almost constantly sick, without signation, and not without deep expressions of repentance for the sins he had committed, as well as sorrow for the blood which he had spilt. He died on the 7th June, 1329, in the 52nd year of his age, and after his reign. His heart was extracted and embalmed with a view to its being carried, according to his request, to the Holy Land; and his remains were interred in the abbey church of Dunfermline.

BRUCHSAL, a bailiwick (Oberamt) on the right bank of the Rhine, in the N. part of the Grand Duchy of Baden. It is in the circle of the Middle Rhine, is traversed by the Painz, and contains the two towns of Bruchsal and Heidelheim, 9 villas, 3 hamlets, about 5900 families, and 30,000 inhabitants, of whom four-fifths are Germans. Bruchsal, the seat of judicial administration, is an old town on the Salzach. It is mentioned in ancient records between the years 937 and 996, when it was called Bruxole: it was the residence of the bishops of Spires from the year 1024,

* Incorrectly stated to be July 24 in the article BANNOCKBURN,
and came into the possession of the grand dukes of Baden in 1818. It is surrounded by a wall, hence known as the Old Town, the New Town, founded in the last century, and the suburbs of St. Peter and St. Paul, which the Salzach separates. The buildings most deserving of notice are the palace, a handsome structure in the Italian style, and its group of gates and courts, of which the chief is the valley of the Rhine; the splendid chapel attached to the palace; spacious barracks and stables; three parochial and three auxiliary churches, the finest of which is that of St. Peter, where the last four bishops of Spires lie interred; an ecclesiastical seminary; a gymnasium; a military hospital, another well-arranged hospital for 70 patients, conducted by an anatomical theatre and a lecture-room, and a general house of correction for the circle of the Middle-Rhine. There are several wine taverns, and the town is distinguished for the year 1748, and derive their supplies from the spring at Ubstadt, which lies at a distance of about 3 m. from the spot; but they are in a state of decline, and do not now produce more than 350 tons of salt per annum. In 1833 Bruessel contained 810 houses, 1747 families, and 7139 inhabitants, whose principal occupation is making and selling wine, and mechanical labour. In 1824 the pop. was 6686, and in 1817 5447. It is on the high road from Carlsruhe to Heidelberg, about 11 m. to the N.E. of the former and 23 m. to the S.W. of the latter.

BRUCHUS, a genus of insects of the section Tettanerga and family Rhychnophora. Technical characters:—head slightly produced, and forming a short and broad rostrum: labrum distinct; antennae eleven-jointed, either filiform, serrulate; wings wanting. This species is found in the larva of certain beetles, before than behind, anteriorly rounded, posteriorly furnished with a lobe near the scutellum: elytra somewhat oblong, not reaching to the s泄 of the abdomen: femora of the hinder legs thick and generally dentated.

The beetles deposit their eggs in the yet tender germ of various leguminous plants; the seed becoming mature is devoured by the larva, which lives entirely within the seed, where it undergoes its metamorphosis. The holes so often observed in peas and other seeds of a similar nature, are formed by the perfect insect to effect its escape; after which it is generally found in flowers.

From the habits of these insects as above related, it may easily be conceived that when numerous they become exceedingly destructive. In Kirby and Spence's Introduction to British Entomology we are told that in North America a species (Bruchus pisi) 'is most alarmingly destructive' to peas, 'its ravages being at one time so universal as to put an end in some places of the culture of the grain.' This insect is less than a quarter of an inch in length, of a blackish colour, and has a grey spot at the base of the thorax in the middle, and several spots of the same colour on the elytra, which are striated. The scarab jointed is fuscous, and the anterior tibia and tarsi are red. The thorax has a little luff on each side, and the femora are also dentate.

Bruchus pisi is a native of our own country (having most probably been introduced in the seeds of the pea), but fortunately is not sufficiently abundant to do much mischief.

Two other species of Bruclus also infest the pea, Bruchus granarius and Bruchus pectinicornis: the latter is common in China and Barbary; the former is a native of this country, and is found among beans, vetches, and other seeds of a similar nature, and is not of much account; of which it devours the seed.

It very much resembles Bruchus pisi, but is rather less.

The true Bruchi are generally of small size.

BRUCIA, a vegetable alkalai, discovered by Pelletier and Caventou, in the bark of the false angustaria, which is the bark of the styraxum nux vomica, and not, as was supposed when its name was given to it, of the brucia antidesperterica. This alkalai is found combined with gallic acid, in the bark and with igsacuric acid in the fruits of some of the different species of styraxum.

It is seen that the best method of preparing the brucia to be dissolved in water, mixing the solution with a little oxalic acid, and evaporating it to the consistency of a syrup. This is to be treated at 32° Fahrenheit, with anhydrous alcohol, which dissolves every thing but the oxalate of brucia; this salt is then to be boiled in water with magnesia; the precipitated brucia is to be dissolved in boiling alcohol, from which it crystallizes on cooling.

When a little water is added to the alcoholic solution of brucia, and the mixture is put to evaporate spontaneously, the brucia crystallizes in colourless transparent oblique four-sided prisms. By rapid evaporation, nearly scales or crystals, in the form of cauliflowers, are obtained. These crystals contain water; they have a strong bitter taste, which remains for a long time. When the hydrate is heated rather below 212° Fahrenheit, it melts and loses about 16 per cent. of its weight of water; the fused mass is a non-crystallized body resembling wax in appearance. It is decomposed by a strong heat.

Brucia resembles the leaves of plants of the order Malvaceae, and parts of cold water and 500 of boiling water for solution. It is readily soluble in alcohol, and even in spirit of wine of specific gravity 088; the volatile oils dissolve a small portion of it, but neither the fixed oils nor ether take it up. One of the distinguishing characters of the alkalai is the appearance of a red precipitate on the addition of magnesia, which imparts to it is changed to a fine yellow by protochloride of tin. The constituents of brucia are, according to Liebig

The crystals contain 16.4 per cent. of water.

The salts of brucia have a bitter taste, and most of them are crystalline; they are decomposed not only by the alkalis and alkaline earths, but by morphia and strychnia, which precipitate brucia.

Nitrate of brucia, the neutral salt, does not crystallize, but gives a gummy mass by evaporation; the suprinate is obtained by adding a little nitric acid to the neutral one. Some crystalline salts are obtained on the surface of the suprinate, they are precipitated on adding water, and are dried on the summit. When heated, it becomes first red, then black, and afterwards detonates with the disengagement of light.

Muriate of brucia crystallizes in quadrilateral prisms obliquely truncated, which are sometimes as fine as hair.

It does not take up any of the impurities.

Salpht of brucia. The neutral sulphate is very soluble in water, and crystallizes in long quadrilateral needles.

The alcohol dissolves it in small quantity. According to Liebig, it loses 2 equivalents of water by efflorescence, and retains 2; the effloresced salt contains 12.94 of acid, 92.64 of base, and 2.32 of water. The supersulphate crystallizes readily when a little acid is added to the neutral sulphate.

Oxalate of brucia crystallizes in long needles, especially which it contains excess of acid.

Phosphates of brucia is not crystallizable, but the super- salt crystallizes in large square tables, which dissolve readily in water, and effloresce by exposure to the air.

Acetate of brucia is very soluble, but uncrystallizable.

Medical Uses. The alkalai is stated to have medicinal properties in several species of styraxum, as well as in the bark of the false angustaria; and as it is employed on all hands that this bark is not obtained from any species of brucia, it has been proposed to change the name of it to Cantramia (derived from Cantrini, and the name under which the styraxum nux vomica is described in Rheed, Hort. Malabaric., vol. i. p. 67). This name is quite unobjectionable, as it exists in the styraxum nux vomica along with strychnia; but it is far from certain that the false angustaria is the bark either of the styraxum nux vomica or of the styraxum colubrina, as conjectured by Virey. [GALIPPE.] It is most probably obtained from some undescribed South American species of styraxum.

Cantrinia acts on the human system as a violent poison.
and in precisely the same manner as strigilis, but more genly, being much less powerful. Hence it has been prop-
osed to be substituted for it. The same precautions must
be observed in its use, and the same contra-indications
are observed. As it is a sudorific and the only useful
paralytic from lead, diarrhoea from atony of the intestines, and perhaps cholera saphrophylia or Indian cholera.
It is important to bear in mind the anhydrous state of
the salt is one-fifth more powerful than the crystallized.
In case of poisoning, emetics may be given, and also tincture
of opium or pilocarpium.

STRACHYNOUS.

BRUCKER, JAMES, a laborious scholar of the last
century, was born at Augsburg, January 22, 1696. He
was educated for the church at the university of Jena, where
he took the degree of Master in 1718. In 1723 he was
appointed parish minister of Kaufbeuren, where he gradually
acquired a reputation for learning, which led to his being
elected, in 1731, a member of the Academy of Sciences at
Berlin, and, soon after, to his being appointed senior minister
of the church of St. Ulrich, at Augsburg, where he spent the
rest of his life, and died in 1770.

At an early age he applied himself to the study of phi-
losophy, and his first work, 'Tentamen Introductions in Historiam Doctrinae de Ideis,' was published in 1719; it
was afterwards enlarged and republished in 1723, under the
title 'Hist. Philos. Doct. id.' In 1726 he published
a history of philosophy in seven volumes 12mo., from
the creation to the birth of Christ, in the form of question and
answer, which contains some details of literary history not to be
found in any other work, in which a complete and
'lar critical History of Philosophy from the infancy of the
world down to our own age,' was printed in 1741-4, in five
volumes 4to., and met with considerable success, for
an edition of 4000 copies was disposed of in 25 years; and in
1744 it was revised and enlarged, with a new volume, con-
sisting of supplemental and corrections. Of his other works
the chief are: 'Pinacotheca Signorum nostrae emere litteris
illustrium,' 2 vols. fol. 1741-55; 'Livros de German Scholars
in the 16th, 17th, and 18th centuries,' in German, 4to.,
1747; 'Historia historia after the discovery of America,
Crusias et a Sparsam edita uno unico facsimilis,' 8vo., 1748.
He undertook to superintend a new edition of Luther's translation
of the Bible, but death overtook him in the course of
the work, which was finished by Teller.

Brukner is now remembered by his Critical History
of Philosophy. The title is ill chosen, for a discriminating
and correct judgment is the very point in which he is most
defective. He was very laborious, and has amassed a vast
quantity of materials; but he wanted the power of arranging
them in a systematic manner. Consequently his work is
wearsome in the extreme, from minutess of unnecessary detail, as well as dryness of style. He
seems to have had the same sort of notion of his subject as
a fly might have of the dome of St. Paul's, after crawling over it. This occurs so often in his work, that it is
felt as a whole, or of the connexion of the several parts.
His book, however, is remarkable and useful, if it were only as an attempt (we believe the only one) to grapple with so
enormous a subject; for he gives an account of every school
from the Hebrew, Chaldean, Egyptian, Phoenician, &c.,
descending through those of Greece and Rome to the sects
of Christian and Judaic philosophers, the schoolmen
and their successors after the revival of learning, the Saracens,
and the nations of modern Asia, Persia, China, and Japan; and the followers of those who with the 17th
century. Horizons. Written being in Latin, this book is accessible to
many who cannot avail themselves of the labours of later
German scholars. As a book of reference, therefore, it is
very valuable in the hands of the lector who is charged with frequent
error, arising partly from inaccurate scholarship, partly from
too much readiness to take his opinions at second-hand. It
will be prudent, therefore, for those who are careful
inquirers, to corroborate Brukner's statements by at least occa-
sional verification.

BRUYS, ADRIALR, was a lieutenant in the French
navy before the revolution, and afterwards became a rear-
admiral in the service of the republic. He had the com-
mand of the Toulon fleet which sailed in June, 1798, for
Egypt, in order to support Napoleon's expedition in
North Africa. After landing the troops, Admiral Bruys anchored his fleet in Aboikur Roads close to the shore, thinking himself safe
from attack. The English Admiral Nelson came in sight of
the French fleet on the 1st of August, and immediately
prepared for battle. Some of the English ships steered be-
tween the French and the shore, and thus the French found
themselves between two fires. [NELSON.] After a dreadful
fight, most of the French ships, being disabled, surren-
dered, and 39 French ships were lost. Admiral Bruys, among
the guns, defending himself against two English ships, was
killed by a cannon shot, just before the Orient was dis-
covered to be on fire. The Orient blew up with most
of the people on board, on the evening of that day. Bruys
must not be confounded with Admiral Bruys, who
was one of the admirals of the fleet of 1798, under the
minister of marine under the Directory, commanded the
fotilla of Boulonne in Bonaparte's time, and died at Paris
in 1803.

BRUGES, the capital city of W. Flanders, in the king-
dom of Belgium, is situated in a level country, in 51°
N. lat. and 3° 13' E. long.; about 6 m. from the sea at
Blankenberg, and 39 m. N.W. from Brussels. Its Flemish
name Brugge is derived from the number of bridges which
cross the canals. Bruges is the French name of the
town. Bruges is a very ancient place. In the 7th century
it held the rank of a city. In 827 it was fortified by Baldwin,
count of Flanders (called Iron-arm), in order to form a
barrier to the progress of the Normans, who then ravaged
Flanders. The city was surrounded by walls in 1033, and
enlarged in 1370. It was almost entirely destroyed by fire
on three several occasions—in 1184, 1215, and 1280. It
was further enlarged in 1331 by Count Lewis de Creycy.

In order to commemorate the high degree of perfection
to which the woollen manufacture had been carried in
the 13th century, King Edward I. of England, gave in
1297, the Golden Fleece. While under the dominion of the
dukes of Burgundy, Bruges became a principal emporium of
the commerce of Europe. The merchants of Venice and
Genoa conveyed thither the produce of Italy and the
Levant, which was distributed through the cities of the
N. of Europe. The tapestry of Bruges was at that time the
most esteemed of any in Europe, and this reputation it long
enjoyed. When, 160 years after the date last mentioned,
Henry IV. of France was desirous of establishing the manu-
facture of tapestries in France, he appointed at Bruges a
manufacturer of Bruges for its management.

In addition to the woolen manufacture Philip the Good
gave encouragement to many other branches of industry,
and particularly to the production of silk and linen fabrics.
In 1488 the citizens rose against the Archduke Max-
imilian, and placed him in confinement. Having vainly
solicited the king of France to support them in this act of
violence, they were reduced to submission by the emperor
of Germany, who marched to the deliverance of his son.
When this army retired, a great number were banished; the
city was deprived of its privileges, and was subjected to a heavy
fine. From this time the city lost its commercial importance, which
was in great part transferred to Antwerp.

The Bruges tapestry was saved by the bath in 1704. Two
years afterwards it surrendered to the allies; and it was twice
taken by the French—in 1708 and 1745, but reverted to
the house of Austria. In 1794 the troops of the French repub-
lic took possession of the city, which was soon after incor-
porated with France, and continued until the close of the
war in 1814, when it became part of the kingdom of the
United Netherlands.

The streets are narrow but neat and clean, and the houses
are mostly large and well-built; many of them have an
ornamentation of statues and statuesque ornaments, with the
former inhabitants. The town-hall is a good specimen
of Gothic architecture. The original building was destroyed
by fire in 1280, and the present hall was built on the same
site in 1360. The town is divided into forty-five streets, in each of which is a Roman Catholic
church, besides which there is a church for protestants.
The Catholic churches contain several fine paintings
and magnificent tombs; those of Charles the Bold and his
father Philip the Handsome, and of the saintly Bruges, are particularly handsome. In the same church is a marble
statue by Michael Angelo of the Virgin and the infant
Jesus.

Bruges contains a museum, a botanical garden, a cabinet
of natural history, a public library, and an academy of fine
arts.

The trade of the city is facilitated by canals which com-
municate by way of the river Scheldt, and of the canal from
Ostend allows the passage from the sea to Bruges of ves-
sels from 200 to 300 tons burren. There are be-
sides a wet dock and a dock for the building and repair of
vessels, and warehouses for receiving goods in entrepot : the
last of which was increased by the town in 1708.

The present manufactures of Bruges consist of linens,
lace, woolen and cotton goods, salt and sugar refining,
carthenware, paper, distilling, and other minor branches
of industry.

Of which in 1814 was 34,015, had increased on the 1st of January, 1834, to 41,914 souls. A statement pub-
lished by the Dutch government gives the number of births
and deaths from 1700 to 1814; the former being 126,744,
and the latter 118,810, show a natural increase of the pop-
ulation in the 11 years of only 8214, or a mean annual increase of two
in a thousand.

The college or Athenaeum of Bruges contained in 1832
131 scholars, 34 of whom received gratuitous instruction,
82 of the scholars received only elementary instruction, and
only ten were attending the class for the higher branches
of mathematics.

The city is badly supplied with water, which is conveyed
to the houses in casks from the canals.

BRUGMABNSIA. To this genus belongs the plant commonly
found in the gardens of the monks of the convent of the
Boscochetto of the Comunians. This latter, like the rest of
the natural order Solanaceae, is narcotic in a high degree.
We extract the following account of it from the Botanical Register. 'This remarkable plant is a native of
elevated and cold situations in the provinces of Tarma, Xauxa, Huanoches, Canta, and Humakas, where it grows
among rubbish; it is also found near the village of La
Cruz and on the banks of the river Mayo, between Alma-
quen and Pasto in New Grenada, where it was found by
Humboldt and Bonpland at nearly 7000 feet above the sea.
It begins to flower in June and ceases in November. By
the Peruvians it is called Floripondio encarnado and Cam-
purillas encarnadas; by the Colombians, Bovochoeto.
Its stature varies from 10 to 12 feet, the stem being generally
unbranched and terminated by a roundish leafy head.
The flowers are either a bright yellowish-orange colour or a
dark orange-red: we believe they change from the former to the
latter. They are succeeded by an oblong, smooth, yellow,
pendulous capsule, which is as much as eight inches long.
This plant belongs to the genus Stramonium, and is
narcotic in a high degree. In the Temple of the Sun, in the
city of Sogamoza, there is a famous oracle, the priests of
which inspired themselves with the intoxicating seeds of this
plant, just as the Pythoness at Delphi is said to have re-
cieved the influence of her God breathing in the navel and
inhalations of the vapors of this plant. From the fruit itself the
Comunians prepare a drink called Tonga, which when weak
is merely soporific, but drunk in stronger doses produces
frenzy, which can only be removed by administering imme-
diate draughts of cold water.'

This plant has lately been introduced into the gardens of
this country, where it proves hardly during the summer, but
requires the protection of a greenhouse in winter.

BRUHL, HENRY, COUNT VON, was born in Au-
gust, 1717. He was a son of the prince of Saxo-
Weissenfels. Henry entered as page into the service of Augustus II, elector of Saxony and king of Poland, gained
his favour, and became his chamberlain. After the death
of Augustus, 1733, Bruhl, who had charge of the crown
jewels at Warsaw, set off with them for Dresden, where he
delivered them to the new Elector Augustus III., and
assisted him, by his manoeuvres, in ascending the throne of
Poland. From that time he became the king's favourite, and
having obtained the dismissal of his rival, Count Sul-
kowitz, he became the minister of this dark monarch, whom
he kept in a state of complete tutelage. Bruhl lived in
great splendour: his establishment was larger than the
king's, and he kept above 200 servants. 'Of all men of
his age, says Frederick II. of Prussia, 'he had most watchs,
dresses, and pleasures; he would have put him among the
numbers of those well-dressed and perfumed heads of which he was not afraid.' The king was indolent to excess, and Bruhl, who took care not to
turb his apathy, and always supplied him with money,
was obliged to borrow to such a degree, that the trea-
sury became bankrupt at last. Bruhl involved Saxony in
financial positions against which it was impossible to
release Saxony army prisoners in the camp of Pirna, and took Dresden,
while the king and Bruhl escaped into Poland. After the
peace they returned to Dresden, where Augustus soon after
died. Bruhl was disliked by both Poles and Saxons, and
was forced to leave the country. After he had been
in Octover, 1764. He had amassed great wealth, which he
left to his children; his fine library of 20,000 volumes was
purchased by the elector for 50,000 crowns. His son Frer-
deric Louis wrote several German plays, which were pub-
lished at Leipzig in 1785-90, in 5 vols. 8vo.

BRUMOY (PIERRE). Father Brumoy belonged to that
order which cultivated the arts and sciences with a
success unrivaled by any other religious community, espe-
cially as far as regards the universality of their acquire-
ments and the extent of their labors. It is remarkable,
however, that the Jesuits are unable to claim with ordinary
writer or one great work in the republic of letters,
and that the little band of Port Royal recluses presented
the world, in a few years, with productions incomparably su-
perior to any which had ever emanated from the whole body
of the disciples of Loyola during the long term of their
existence.

Brumoy was born at Rouen in 1669, and entered the
society of the Jesuits in 1704. He was subsequently in-
volved in the affair of the pretended priest of Talmont,
and became a contributor to the Journal of Treasures.
In 1742 he introduced himself to the public by 'Thoughts
on the Decline of Latin Poetry,' and afterwards edited 'The
History of Tamerlane,' written by Margret, a brother Jesuit,
and published by the printing house of the order in
1747. Shortly after his death, his superior's allowed to him
the continuation of 'The History of the Anglican Church,' of
which work he had already published 11 volumes and was completing the 12th, when he died at Paris on the 16th April, 1762, in the 54th year of his age.

Among all who have done honour to the Society of Jesus,
both by their moral character and their literary talents,
Father Brumoy stands preeminent. With the study of
literature he combined that of the mathematics, which he
taught from 1725 to 1730, and it is to this circumstance
that we are indebted for his discourse 'Upon the Utility of
Mathematics as connected with the Belles Lettres.' His
work consists of- 1. 'A Life of the Empress Eleonora,'
Paris, 1723, 12mo., imitated from the Latin of Father
Fontaine, 3 vols., 8vo.; 2. 'An Essay for the Regain of the
Discourses and Remarks upon the Greek Theorists,' Paris, 1742.

His work, which, although highly and justly esteemed for the
greatest learning which it exhibits, is deficient in simplicity and
precision of style, and even occasionally betrays the want
of a perfect comprehension of the original text; these errors
have been rectified in the editions of 1785-1789, 13 vols.
8vo.; 5. 'A Collection of various Pieces in prose and verse,'
14 vols., Paris, 1741, including discourses, epistles, tragedies,
comedies, Isaac, Jonathan, the Coronation of David, Paulina's
Discourses, and Remarks in praise of the Rhine. Father
Brunoy also made a new edition of J. Murguia's 'Treatise
upon French Poetry,' Paris, 1724, in 12mo. He also trans-
lated two Orations of Father Porés, one upon public exhi-
bitions, and the other upon the question whether the
monarchical or the republican form of government was
best fitted for forming the heroic character. 7. Brunoy
completed, in conjunction with Father Rouillé, 'The
Revolution of Spain,' by Father d'Orelie, Paris, 1734, 3 vols.
4to.; assisted in compiling 'The Memoirs of Tuvex,' and
published the 'History of Kieni' of Father de Courcoun,
Paris, 1733, in 12mo.

BRUN, CHARLES LE, the son of a sculptor of Scotch
eextracion, was born at Paris in the year 1619. The singu-
lar merit of his juvenile sketches attracted the attention
of the Chancellor of France, who recommended his
education, and placed him, at the age of eleven, with Vaugé,
and afterwards with Nicholas Poussin. He remained in
Italy six years, studying the antique and the works of the
old masters. He accordingly cultivated a knowledge of his artist's costume. On his return to Paris in 1670, he was received into the Academy. From this time employment and honours poured in upon him. Having attained the highest rank in the Academy at Paris, he was appointed principal painter to the king, was invested with the order of St. Louis, ultimately made a chevalier of the Academy of St. Luke at Rome, although absent, and a foreigner. A change in the ministry, which had so long favoured Le Brun, carried political animosities into the painter's studio, and, although still honoured by the council, of the long disabléd of favour and vexation at the continued annoyances which he met with at court, in 1690, leaving a widow, but no children.

Le Brun was an industrious and a learned artist; his drawing is bold and correct, and his design often replete with originality. His portraits, however, express the character of his countenances is neither refined nor elevated, and the grandeur of his pictures belongs rather to the physical than the moral development of the subject. His groups are well arranged, and natural; the action of individual figures is also reported to have made them the progress in the several affections of grace in some part or other. His works are principally at Paris. The Battles of Alexander, which are so well known by engravings, are very characteristic specimens of his style, and would alone enable him to be of his rank. The Passion of the Gracianus, and the Battle of Arbela, are works of great power and feeling. His defects of colouring have been partly attributed to his neglecting to visit Venice; but his excusers have forgotten that Giorgione and Titian had no Venetian studies.

His facility in drawing was such, that having procured the delay for one moment of the car which conveyed the Marquise de Brinviller to execution, in 'four strokes of the pencil,' says his French biographer, he sketched a likeness. With the brush he was equally ready. Louis XIV., who daily spent two hours in watching his progress, while painting the 'Family of Darius' at Versailles, desired him to paint at once the head of Parysatis, which he executed within a week. He devoted the 'Promotion of Corton,' to Bernard, who was not among the number of his friends.

BRUCK, RICHARD FRANCOIS PHILIPPE, was born at Strasburg, December 30th, 1729. He was educated by the Jesuits in the college of Louis le Grand at Paris, and is reported to have made both are the progress in the several branches there taught. An early engagement in the affairs of active life suspended his taste for literature while he was employed as military commissary. He had attained his thirty-fifth year, when, during a residence in winter-quarters at Giensville, he was invited to go with him on his campaign and to lodge in the house of a professor, who revived in him a love for letters. On his return to Strasburg he devoted himself to study, to which the possession of an easy fortune allowed him entire application; and the professor of Greek, who was of the obliging character of the great Young, became his constant companion. Bruck quickly became well versed in that language. No sooner did he feel his own strength than he distinguished himself by his criticisms: but his emendations, which are sometimes happy, are always hazardous; and acting under a connexion, and that of the errors of the text in all cases preceded from the fault of copyists, he corrected with a more 'shaking hook' than even Bentley himself ventured to employ. His first work was an edition of the Greek Anthology, published under the title of Anthologia poetarum Graecorum, Strasburg, 3 vols. 8vo., 1776; which contains, besides the epigrams usually given in an Anthology, several of the minor Greek poets, Anacreon, Callimachus, &c. entire. Anacreon appeared in a separate edition, in 1775. In St. Petersburg he was immediately received with pleasure, and excited a great desire for the appearance of a complete edition of Sophocles which he had announced. His favourite author, Apollonius Rhodius, employed him in 1786, and was followed in 1783 by aristophanes, which superseded all his predecessors, and has since in turn been entirely superseded by other editions. In the year following he prepared the fragments of Theognis, Solon, Simonides, and other didactic and moral Greek poets, under the title of 'Rheus Pheges,' sive Grammaticale Poetorum, 3 vols. 8vo., 1785. In 1786 he issued an edition of Virgil, in which he was the established text. His Sophocles at length attracted the attention of scholars in 1786, and may be considered as the work upon which his reputation is chiefly founded. Subsequent critics however have found plenty to do with Sophocles notwithstanding the labours of Bruck, and one part of their business has been to restore the MS. readings which this daring editor had replaced by his conjectures. It appeared at first magnificently printed in 2 vols. 4to.: a little later, after a second edition and a third, in folio, in 1786, and there is a third edition, under his own eye, in 4 vols. 8vo., 1786-89. He prepared a copy of Plautus for the Bibliotaph of the classics in 1788. On the breaking out of the revolution he embraced the popular side with ardour; and not hesitating Le Brun, in return for a presentation copy of the quarto Sophocles superbly printed on vellum, had conferred on him a pension of 2000 francs. Bruck enrolled himself among the earliest members of a revolutionary society established at Strasburg. During the Reign of Terror he retained his post of secretary of the Academy. On the 10th September 1793 he was beheaded. Reverses of fortune, produced by the public troubles, obliged him in 1791 to dispose of part of his library, and in 1801 of the remainder. His taste for Greek literature became extinct with the peace of Leipsic, and after the death of his son he never spoke without tears. He still however retained some fondness for the Latin poets. In 1797 he printed an edition of Terence in quarto; and at the time of his death, which occurred on the 12th of June, 1803, he was engaged in superintending a manuscript, of which the result was an edition most remarkable. Instead of referring the printer to any former edition, he always transcribed the entire text of the author upon whom he was engaged. Thus he twice copied Sophocles, and Apollonius at least five times. Many of these manuscripts, together with his notes, are still preserved in the Bibliothèque Royale at Paris. The margins of his books were crowded with conjectures, which in numberless instances showed the boldness rather than the judgment of their author. He was a member of the Academy of Inscriptions and Belles Lettres, and also of the French Institute.

BRUNE, MARSHAL, was born at Brives, dep. de la Corrèze, in 1736. His father was an advocate, and Bruno, after a military career, entered the army, and served under Dumouriez, and later under D'Erlon. He was quickly promoted, and was general of brigade in the army of the interior under Bonaparte in 1795. The following year he joined the army of Italy, and served in the invasion of Austria before the peace of Leipsic. Of his retirement from active service he was sent by the Directory as commander-in-chief of the army which invaded Switzerland. [BRUN.] After the fall of Bern he took the command of the army in Italy, and obliged the king of Sardinia, who was the forced ally of France, to conclude a peace not to his satisfaction. In 1799, he became commander-in-chief of the capitol, Turin. After having thus prepared the fall of that monarchy, he was replaced by Joubert, who finally effected it in December, 1798. Bruno was next sent into Holland, where, in 1798, he defeated the Russians on the Helder, in which he was obliged to retreat. About that time he was appointed general of the French empire. He commanded for a while the camp at Boulogne. Being sent to Hamburg in 1807, as governor of the Hanseatic towns and commander of the reserve of the Grand Army, he had a long interview with Gustavus king of Sweden, near Aix-la-Chapelle, which seems to have given rise to suspicions on the part of Napoleon. In the surrender of the island of Rügen by the Swedish General Toil, agreeably to a convention with Marshal Brune, the latter happened to omit in the text of the convention the titles of the Emperor Napoleon, and mentioned simply the French army and the Swedish army as parties to the agreement. Napoleon, who was highly offended, sent Brune his recall, sting his conduct a scandal never seen since the time of Louis XIV., and he was therefore retired and disgraced, till Napoleon's first abdication, when he made his submission to Louis XVIII., who gave him the
cross of St. Louis. During the 'hundred days' he joined Napoleon, who sent him to command a corps of observation on the Var. After the battle of Waterloo he proclaimed the king, and having been taken prisoner at Avignon on his way to Paris, when he found himself in the midst of the reaction that took place in the southern provinces at that time. A furious mob forced its way into the inn at Avignon, where Brune was, and after insulting him, and having thrown stones, articles, and other objects, at his body, taken part in the massacres of August and September, 1792, to which Brune calmly replied that 'he was at that time fighting on the frontiers against the enemies of his country, they shot him in the room of the inn as he was standing with his back to the door. They took his body, then dragged through the streets, and thrown into the Rhone. (Nouvelles Causes Politiques et Criminelles.)

BRUNEAU, the younger daughter of Athagnade, king of the Visigoths of Spain, married, in 565, Siegbert, the Frankish king of Metz or Austrasia. Her eldest sister Galsuinda, married Chilperic, Siegbert's brother and king of Soissons. Galsuinda was soon after murdered by Fredengoda, the mistress of Chilperic, who then married her. Brunehaut, determined to avenge her sister's death, induced Chilperic to make war upon his brother, and Chilperic only obtained peace by giving up part of his states. Other wars took place between the brothers, at the instigation of their wives, and in the end Chilperic having lost his territories, war commenced. The death of the king, whom the assassins, hired by Fredengoda, murdered Siegbert in his camp, 575. Upon this Brunehaut came out of Tournai, and made Brunehaut and her son Childredibert prisoners. Meroveus, son of Chilperic, falling in love with Brunehaut, enabled her to escape into Austrasia, and Meroveus was in consequence murdered by Fredengoda. Chilperic himself was soon after murdered, 584, and by the order, it was believed, of Fredengoda, who remained regent and guardian of her infant son Clotaire II. The history of the Merovingian kings is a continual tale of dissensions, and, on the death of Thierry, seized upon Austrasia and Burgundy, and thus reunited under his sceptre the whole kingdom of the Franks. Brunehaut, being taken prisoner by Clotaire, was condemned to a monastic cloister. Afflicted by the insults she was tied to a horse's tail and thus driven about till she was dead, when her body was burnt and the ashes scattered to the winds. Her old enemy, Fredengoda, had died many years before, in 597. The true character of Brunehaut has been the subject of much controversy. Several of her contemporaries, such as St. Gregory of Tours, and Pope Gregory the Great, speak highly of her, while those who asperse her memory, such as Fredengoda, Aimoin the monk, &c., lived at least a century after her. Brunehaut is said to have given her nun's habit to Clotaire, and probably also to the nuns of the nobles of her own dominions. Pasquier, Velly, Du Tillet, and other writers, have also taken the defence of Brunehaut. The part of her reign against which charges have been raised is that about the time of the religious training of her two grand-children, when she had to struggle against the nobles. A monument was raised to her in the church of St. Martin of Autun. She is said to have promoted the preaching of Christianity in England.

Filippo was accordingly initiated in those studies which would prepare him for whichever of the two pursuits he should adopt; yet although not deficient in application, the more serious and philosophic sciences did not perhaps kindle his imagination so much as the study of art and sculpture in particular, of which latter it might in fact be considered a direct branch. In fact, it frequently served as a kind of apprenticeship to the last-mentioned art, as happened in Brunelleschi's case. Led on by his own talent and the intimacy he had formed with the celebrated Donatello, he applied himself to sculpture, and with such success that he was admitted as one of the competitors in the designs for the bronze gates of the Baptistry at Florence.

After this he began to think of signifying himself in architecture, and as Donatello was about to proceed to Rome, resolved on accompanying him thither for the purpose of acquainting himself with the ancient buildings in that city. Here he perceived what a career was opened to him who should endeavour to revive a style of architecture altogether so different from that which had prevailed for so many centuries. In 1407 he returned to Florence, where it was proposed to complete the structure of Santa Maria, which had been commenced by Arnoldo di Lapi shortly before, as is said, of his own design. Some say, 1298, and which was afterwards carried on by Giotto. With this view the most eminent architects were invited from all parts to devise in what way it would be practicable to cover the spacious octagonal area between the four branches of the cross. How it was originally intended to effect this, in accordance with the other parts of the edifice, does not now appear. Owing to the magnitude of the space to be covered by a single vault, very formidable difficulties presented themselves, and the possibility of doing the work on the plan of the dome of Santa Sophia, the diameter of which is something more, there was no precedent or example by which to be guided, unless it was by St. Mark's at Venice, and the cathedral at Pisa, which however are so different that they could not have afforded much information for the purpose. While the rest were engaged in fruitless debates, Brunelleschi was assiduously employed in maturing his plans, models, and schemes of operations, and contented himself with pointing out the hazardousness of a project which he had assured himself he should be able to accomplish. Twice over he prepared the means for the purpose of leaving all his rivals in perplexity, and each time he was solicited to return. At length after a multiplicity of proceedings, into which our limits render it impossible to enter, Brunelleschi's model, explaining the means of its execution, and showing how it was to be publicly exhibited, and convinced every one of his success. He was commissioned to commence the work, but it was soon determined to associate with him a colleague, no other than Lorenzo Ghiberti. Upon this his indignation knew no bounds; he resolved upon abandoning both the work and the city itself for ever; nor was it without extreme difficulty that his friends prevailed upon him to change his determination. Resolved upon manifesting Ghiberti's incapacity, which he knew would betray itself, should he be left unaided, Brunelleschi could not be restrained, for Ghiberti being unable to proceed alone was removed, and Brunelleschi was constituted sole architect. He now gave all his energies to the work, and had the satisfaction of seeing this chief d'œuvre terminated before his death of 1446.
work, it was by no means the sole one of any magnitude which he executed. Among his other productions may be mentioned the church of San Lorenzo at Florence, and the celebrated Hospital of St. Luke at Pisa, which was afterwards continued and completed by Ammannati. He is more remarkable for its severe simplicity and massiveness than for any of the graces of architecture, or for what belongs to design. Its idea, in fact, appears to have been derived from the ancient Greek style, and it has the form of certain monstrosities, owing to the unvaried repetition of the same features, namely tiers of arches, it also possesses the character of a vast and solid construction, which produces an impression not so much by form as by bulk and positive quantity.

Bruni was also employed on several works at Mantua and in its vicinity. In his private character he is said to have been a man of a noble and generous spirit; and that as an architect he was enthusiastic in devotion to his art, there can be little doubt. He died in the year 1444 (that of Bramante's birth), and his last endeavours were to found a monastery at Santa Maria del Fiore, his remains resting within that edifice which he had contributed to his skill, and which will perpetuate his name.

Bruni, Leonardo, was born at Arezzo, of humble parents, but studied Latin and Greek, at Florence, under the learned Coluccio Salutati, and afterwards went to Rome, where he obtained the post of secretary in the papal chancery, (Bracciolini,) under Innocent VII. In a tumult, which took place at Rome against the papal govern, he was shipwrecked by the Turk, and escaped the difficulty to Viterbo, where the pope took shelter. Bruni continued in his office, under Innocent's successors, and he attended John XXII., in 1414, to the Council of Constance. After the deposition of that pope, Bruni returned to Florence, and was elected rector for 1426. In 1427 he was appointed chancellor to the republic, an office which he retained till his death. He was also sent by the state on several missions. When the Emperor John Paleologus and the Greek patriarch came to attend the council of Constance, he received them in the name of the republic. He died in 1444, and was buried, with great honours, in the church of Sta. Croce, where he is seen on his monument reclining on a bier with the volume of his 'History of Florence' on his breast, and a crown of laurel round his head, for in this manner he was buried by order of the community. Giannozzo Manetti received a long and learned oration at his funeral, but his friend Pfeiffer, not being satisfied with it, composed another and more eloquent panegyric. Piglio also wrote an eloquent address to the people of Florence, in argument of his friend Poggio, and he did not indulge so much as the latter in violent disputes and virulent invectives. Once, however, he quarrelled with his friend Niccolo Nicolli, and wrote a bitter libel against him, which has never been printed. Bruni's name is preserved in the annals of Florence. Bruni was commonly styled L'Aretino, from the place of his birth, which circumstance has led some travellers, and Mme. de Staël among the rest, to mistake his monument at Sta. Croce for that of the obscure writer Pietro Aretino, and he was buried at Verona (Valery, Voyages en Italie.) Bruni wrote a great number of works, many of which are now forgotten, and have never been printed. Méhúx gives the titles of 63 of them in his biography of Bruni, prefixed to the edition of his 'Epistoles,' vols. 6vo, Florence, 1741. Among his last works was a history of the Poles, entirely new, of great breadth from 'Procopius;' a commentary on the Polloepanian war, a book on the first Punic war, to fill up the void of the lost books of Livy, a history of his own times from the schism of Urban VI., and Clement, in 1368, till the victory of Cassano by the Florentines, in 1446; and the 'Historia Florentina.' This last, Bruni's principal work, begins from the foundation of Florence, and is carried down to the year 1404. It was printed at Strasburg, fol. 1610, and was also translated into Italian by Donato Acciaiuoli. Vignon, Angiuglia, by the mob, and Bruni in the face to his own 'Storie Fiorentine,' says of his two predecessors, Bruni and Poggio, that they related diligently the wars and other external transactions of the republic, but were either silent or very brief in their accounts of the civil factions and other internal transactions, either through prudential reserve or because they looked upon those domestic contents as beneath the dignity of history. Bruni translated into Latin 'Plato's Epistoles,' and dedicated them to Cosimo de Medici; his dedicatory address is given in Rocce's 'Lorenzo,' vol. i. Appendix 3. He also translated the Second Part of Polidoro's 'History of Florence,' and the speeches of Demosthenes and Aeschines; and made numerous other translations from the Greek. He wrote, in Italian:

1. 'Vite di Dante e del Petrarcha,' Florence, 1672, which are not among the best biographies of these two illustrious men.
2. 'Storia d'India in India,' London, 1680, a very curious and remarkable book, and afterwards it turned into Italian, printed, for the first time, by Bodoni, Parma, 1804.
3. 'Novella di Messer Leonardo d'Arezzo,' inserted among the 'Novelle di Varg, Autori,' and published again separately at Verona, 1817.

It is founded on the story of Stratton, wife of Seleucus, and her step-son Antiochus. (Mazzuccelli, Scrittori d'Italia.)

BRUNI'ACE, a small natural order of exogens, belonging to the albuminous group, and, notwithstanding the different habit, nearly allied to the currant tribe (grossularia). The species are small heart-like shrubs with minute, closely imbricated leaves, and small flowers condensed in little compact heads. They have a superior 5-celled calyx, 5 petals, 5 perigynous stamens, and a discococcus or indehiscent 2 or 1-celled fruit, crowned by the persistent calyx. The seeds are solitary or in pairs, and have a short aril. All the species are from one from from Holland to Cape of Good Hope. They are of no known use. Bruniaceae differ from Grossulariaceae in their dry fruit and central placenta; from Escalloniaceae, in the very small number of their seeds; from Rhamnaceae, in their minute emargined and rounded petals; and from Ulmaceae and Araliaceae, in their flowers not being in umbels.

Brunings, Christian, was born in 1736 at Neckerau in the patinate. He early applied himself to the study of hydraulics, and ultimately became one of the best hydraulic engineers of the Ancien Régime. He was of Holland having appointed him in 1769 inspector-general of the rivers and canals, he effected many useful works, drained several tracts of land, repaired the dykes of the Haarlem Meer, deepened the bed of the Oosterwaer, and opened the end of the Delft canal, which communicates between the Waal and the Rhine. In the course of these operations he invented an instrument to measure the rapidity of streams, and to determine the same at any depth. He explained the principles and the use of this invention, which goes by the name of the Brüning's Strommesser, in a treatise which has been translated from the Dutch into German under the title of 'Abhandlung über die Geschwindigkeit des fließendes Wassers, und von der mitteln dieselben auf einen tiefen zu bestimmen.' 4to. Kéhre, 1782. It is a kind of cumber, with gilded letters, beaking, councillor of Hesse Darmstadt, in which the great services rendered by Bruning to Holland are enlarged upon. Bruning died in 1805. The government of the then Batavian republic proposed to erect a monument to his memory, but the French consequent political changes prevented its being carried into effect. Several scientific essays of Bruning's are inserted in the 'Memoirs of the Haerlem Sociëty of the Sciences.' There is another Christian Bruning, a native also of the patinate and a professor, who wrote a book on the 'Antiquities of Greece,' Frankfort, 1724, which was published again some years after with an appendix on the Roman Triumphs.

Brünn, a circle of the Austrian Margravate of Moravia, on the N.W. by Bohemia and on the S. by Moravia, on the N.E. by Austria, and on the W. by the Oder. It contains about 1,732 sq. m., it contains 13 towns (among which are Brünn, Mikulov or Nickoburg, Bockowitz, Wischau, and Austeritz), 56 m. t. and 649 vill., and a pop. of about 330,000 souls, which shows an increase of about 25,000 since the census of 1827. The N. districts are occupied by mountains, with some fertile valleys among them: the S. parts, which are more level and have a richer soil, produce large quantities of wine. The circle is watered by the Zwitava, Schwartzava, and Iglia, which fall into the Thaya, the latter the principal river of the, between the valleys of the Thaya near Landshut at the S. extremity of Brün. The inhabitants subsist principally by agriculture and wine-making, spinning, weaving linens and woollens, and making leather, potash, &c. The country produces grain, hops, flax, fruit, timber, iron, and alum, and other minerals. The breeding of cattle is also of some extent.

Brünn (in the native tongue Brno, a term which corre-
responsible to our English word 'fodst,' has been the capital of Moravia, since 1641, when the seat of government was transferred from Olmutz. It lies in the centre of the circle near the confluence of the Zwittova and Schwartzava, which run on each side of it; is situated in the middle of a fine open country; is set in a fine group of buildings; and commands some beautiful and extensive prospects. The town is surrounded by a deep ditch and high walls, and was formerly protected by a citadel which takes its name from the Spielberg, a hill 816 ft. in height, on the summit of which it is constructed; but since the partial demolition of its defences by the French, in 1809, it has been converted into a state-prison and a house of correction. East of the Spielberg is another eminence, the Franzensberg, about 600 ft. in height, along one side of which the residences of the rich citizens of Brinn have been erected. Independently of the Spielberg, the town is about 1¾ m. in circuit, and has four gates facing N. E., S., and W.; the streets are irregular, narrow, and crooked, but well paved, provided with flagstones for foot passengers, and well lighted at night. There are seven squares ornamented with fountains, the largest of which is the vegetable market; the houses, which are in general of regular construction, amount to about 2300, including the ten suburbs. Within the last twenty years the pop. has increased, and which was then about 5500, and 2700 military and 2700 individuals not natives of the town or environs. The finest square is the Large Square, which is of spacious dimensions, and embellished with a handsome column dedicated to the Virgin Mary, a corps-de-garde, and a statue; in reality, indeed, the residence of six parishes, and has as many parochial churches besides those in the suburbs. The cathedral stands on the Petersberg, a rocky height in the W. part of the town, and has no particular claim to architectural beauty. St. Jacob's is a fine example of the style of architecture of the fourteenth century: the roof, which is very lofty, is supported by two rows of columns, and is covered entirely with copper: the steeple, said to be the highest in Moravia, is 276 ft. in elevation; and the interior contains a handsome marble monument, in which are interred his remains, and the portrait, with the date 1686, of the victor over Brinn against the Swedes in 1644. The church of the Minorites, with the adjoining sacred staircase, and house of Loreto, is of peculiarly handsome construction; and the church of the Capuchins, celebrated for Sandriani's fine altar-piece, the raising of the Cross, as well as the Gothic church of the Augustine monastery, in the Albrunn suburb, with Krasch's Madonna, and a large library, are well deserving of notice. Among other public buildings are the Dicasterial House, which contains the governor's residence and audience-room, the police department, the town-hall with embellishments in the Gothic style; the theatre, and its assembly-room; the college of the Jesusites, at present used for soldiers' quarters, the northern front of which occupies one side of a whole street; the government buildings; and some of the commanding sites in the town; the handsome mansions of the Dietrichsine, Kaunitze, Liechtenstein, Zierotin, and others of the nobility; the military hospital, formerly a church belonging to the Premonstratensian order; and the Maria-schule, a school for females of noble birth. There are several delightful promenades in and near Brinn, the most attractive of which are the gardens on the Franzensberg, which are ornamented with an obelisk, 69 ft. high, erected in 1818 in honour of the late emper. Francis I. The obelisk is partly in the English and partly in the French style. Brinn is the seat of government for the Margraviat; and also of the high courts of judicature. It is the centre of episcopal jurisdiction, and the Protestant consistory is established there. The National Society for the encouragement of agriculture, natural history, &c., has the Franzens Museum, with its valuable collection under its care. The academical institutions consist of an Episcopalian seminary, a gymnasium, an academy for educating teachers, a school for the instruction of young women, an academy for young females attached to the Ursuline convent, and several schools for the lower classes. The principal benevolent institutions of the town are a general infirmary, founded by Joseph II. in 1785; a lying-in hospital and lunatic asylum; an orphan asylum; a society for the relief of the poor at their own houses; a refuge for the widows and orphans of teachers in Moravia and Silesia; asylum for decayed liver-servants, for the blind, and the deaf and dumb; and a national loan-bank. Independently of the house of correction on the Spielberg, there is another here for the province in general.

Brinn is the seat of some considerable manufactories, particularly of woollen goods and leather. The manufacturers of Hungarian and Viennese markets: of these there are seventeen establishments at work. The other fabrics chiefly consist of silks, ribbons, yawns, and machinery for the woollen manufactures, leather, cotton prints, woollen caps, and vinegar. No town in Moravia has so extensive a domestic trade, in which it is much favoured by its central position with respect to Prague, Breslau, Pesth, and Vienna. It has four wholesale markets in the year, which are each of 14 days' duration, and to which the manufacturers of Bohemia, Moravia, Silesia, Galicia, and Poland, send their goods in considerable numbers. The trade of Brinn in colonial and other foreign productions is also extensive.

The Spielberg is in 49° 11½' N. lat., and 16° 36' E. long.; and the town is about 70 m. due N. of Vienna.

Bruno, GIORDANO, was born at Nola in the king dom of Naples, about the middle of the sixteenth century. He entered the order of the Dominicans, but being of an inquisitive turn of mind, he began to express doubts on some of the dogmas of the Roman church, the consequence of which was the persecution to which he was exposed. Upon this he went to Geneva, where he spent two years, but soon incurring the disfavour of the Calvinists, on account of his general scepticism on religious matters, he removed to Paris, where he published, in 1583, a satirical comedy, 'II Candeletto,' and in 1589, a work entitled 'La Guerra della Ciumenta,' this comedy was afterwards imitated in the French anonymous play, 'Boniface et le Pédant,' Paris, 1633. Bruno gave lectures on philosophy, in which he openly attacked the doctrines of the Aristotelians, which had already been combated in the West by S. Augustine and A. Ragionieri, and had made himself many enemies among the professors of the Paris university, as well as among the clergy, he went to England in 1583, where he enjoyed the protection of Castelnaeu, the French ambassador, and gained the friendship of Sir Philip Sidney, and, having formed a project for the establishment of a university at Padua, he entered into a correspondence with Bruno against the Swedes in 1644. The church of the Minorites, with the adjoining sacred staircase, and house of Loreto, is of peculiarly handsome construction; and the church of the Capuchins, celebrated for Sandriani's fine altar-piece, the raising of the Cross, as well as the Gothic church of the Augustine monastery, in the Albrunn suburb, with Krasch's Madonna, and a large library, are well deserving of notice. Among other public buildings are the Dicasterial House, which contains the governor's residence and audience-room, the police department, the town-hall with embellishments in the Gothic style; the theatre, and its assembly-room; the college of the Jesuits, at present used for soldiers' quarters, the northern front of which occupies one side of a whole street; the government buildings; and some of the commanding sites in the town; the handsome mansions of the Dietrichsine, Kaunitze, Liechtenstein, Zierotin, and others of the nobility; the military hospital, formerly a church belonging to the Premonstratensian order; and the Maria-schule, a school for females of noble birth. There are several delightful promenades in and near Brinn, the most attractive of which are the gardens on the Franzensberg, which are ornamented with an obelisk, 69 ft. high, erected in 1818 in honour of the late emper. Francis I. The obelisk is partly in the English and partly in the French style. Brinn is the seat of government for the Margraviat; and also of the high courts of judicature. It is the centre of episcopal jurisdiction, and the Protestant consistory is established there. The National Society for the encouragement of agriculture, natural history, &c., has the Franzens Museum, with its valuable collection under its care. The academical institutions consist of an Episcopalian seminary, a gymnasium, an academy for educating teachers, a school for the instruction of young women, an academy for young females attached to the Ursuline convent, and several schools for the lower classes. The principal benevolent institutions of the town are a general infirmary, founded by Joseph II. in 1785; a lying-in hospital and lunatic asylum; an orphan asylum; a society for the relief of the poor at their own houses; a refuge for the widows and orphans of teachers in Moravia and Silesia; asylum for decayed liver-servants, for the blind, and the deaf and dumb; and a national loan-bank. Independently of the house of correction on the Spielberg, there is another here for the province in general.

Bruno, GIORDANO, was born at Nola in the kingdom of Naples, about the middle of the sixteenth century. He entered the order of the Dominicans, but being of an inquisitive turn of mind, he began to express doubts on some of the dogmas of the Roman church, the consequence of which was the persecution to which he was exposed. Upon this he went to Geneva, where he spent two years, but soon incurring the disfavour of the Calvinists, on account of his general scepticism on religious matters, he removed to Paris, where he published, in 1583, a satirical comedy, 'II Candeletto,' and in 1589, a work entitled 'La Guerra della Ciumenta,' this comedy was afterwards imitated in the French anonymous play, 'Boniface et le Pédant,' Paris, 1633. Bruno gave lectures on philosophy, in which he openly attacked the doctrines of the Aristotelians, which had already been combated in the West by S. Augustine and A. Ragionieri, and had made himself many enemies among the professors of the Paris university, as well as among the clergy, he went to England in 1583, where he enjoyed the protection of Castelnaeu, the French ambassador, and gained the friendship of Sir Philip Sidney, and, having formed a project for the establishment of a university at Padua, he entered into a correspondence with
confirmed heretofore, and he was given up to the secular power. After being detained eight days in the city prisons, he was taken to the Campo di Fiore, and burnt alive on the 17th February. Scipio the Latinist, who seems to have been present at the execution, relates, in a letter to Rittershusius, that as the man was burnt, Scipio himself threw a stone on him, upon which Scipio exclaimed, 'Such is the manner in which we at Rome deal with impious men, and monsters of such a nature!'

Bruno’s works, some of which had been very rare, while others remain unedited, have been collected and published together by Dr. Wagner, with a life of the author: "Opera di Giordano Bruno Nolano ora per la prima volta raccolte e pubblicate," 2 vols. Svo. Leipzig, 1830.

BRUNO, S., born at Cologne in 1651, studied at Paris, and afterwards at the University of Louvain, and was directed to the school of Calvianism. From this, and a direct intercourse with the schoolmen of the religious establishment, he was driven, and decided to travel in different parts of Europe, and to pursue his studies independently. He visited Paris, then the seat of learning, by the advice of his father, and became involved in disputes with the Jesuits, who expelled him from the university. He then went to England, and to the universities of Cambridge and Oxford, where he continued his studies. In 1681, he published his "Tractatus de fide," which was translated into Latin and published in London the same year. The tract was republished in 1684, and again in 1689. Bruno was a man of great learning and erudition, and his works are of great value to the history of modern philosophy. He was a,.....
rises in the Harz, passes into the Hildesheim territory. The chief streams which discharge their waters into the Elbe or Harz are the Lippe and the Bode. The Bode is the principal riv. of Blankenburg.

Bruchow contains a great number (according to Venturini 600) of natural pieces of water. The Wippersteich, near Vorsfelde, is still the largest of them, although a considerable number of smaller ones has been added here from the recitation of the local mineral springs of some note at Helmstedt and near Steinfurt. The Harz, and sulphured waters near Bisperoe and Bessingen. The great moras which formerly extended from the Ocker to the Bode has been drained by the navigable can. which now under the name of the Weser flows a mean of recovering several hundred acres of land, which are at present converted into luxurious meadows and pastures.

The valleys between the mountain-ranges of the S. and W. parts of Brunswick are by no means so favorable to the growth of vegetation as the lands near the vicinity of the Weser and Leine. The eastern highlands are low-lying, and are cold and stony for agricultural purposes, are used for grazing and supplying timber; but the N. part of Brunswick, where the sand usually acquires its presence from the loss of loam or mould, yields good crops of most kinds of grain. The country is seldom parched by excessive heat and winter is usually limited to three months' duration in the northern districts; and even in the southern, the atmosphere is cold and exposed to storms only among the mountain-regions of the interior. In the harvest season the second or third week of July and ends in the middle of November; and in the southern it is not above fourteen days.

It has been estimated that thirty-three out of fifty-five parts of the entire surface of Brunswick have been made pleasant, and suitably drained. Of this area 45,520 acres are arable, 19,800 cultivated in fruits and vegetables, 48,520 used as meadows; that the woods and forests occupy 322,600, the meadows and commons 235,460, and the ponds and pools 2560. The yearly produce of corn, rye, wheat, rye, and malt for animal food is calculated at 1,500,000 meadow and 3,500,000 shecelf. Of and of this produce the winter wheat is a ready surplus for exportation. The quantity of beans and peas grown is about 175,000 shecelf of; of potatoes the quantity is considerable; of tobacco, between 6000 and 7000 cwt. of hemp, between 15,000 and 20,000 cwt. of rape-seed, sufficient to yield 600 tons of oil; and of flax, about 4200 tons. Much chichory is raised as a substitute for coffee in the neighbourhood of the capital, and the whole produce amounts to between 16,000 and 20,000 cwt. per annum.

Horses are but partially reared, and most of them are of an indifferent stock; and though some good has arisen from the ducal stud kept at Harzburg, the best continue to be imported from Mecklenburg, Lüneburg, and Holstein. In 1800 there were 1400 horses, in 1818, 1300; and in 1828, about 55,610. With respect to horned cattle, the breed on the richer soils is, from want of care, far inferior to that in the upland districts. The farmer of Wolfsbütte, for instance, will obtain but four pounds of butter from his cow where the farmer of the Harz will obtain seven. In many parts the breed has been improved by intermixture with Friesland and Swiss cattle; and the stocks have increased during the last twelve years from 86,400 to about 92,100. Great attention has been paid of late years to sheep; the number of which was 255,955 in 1812, and present to be little short of 306,650, while the yearly produce of wool now exceeds 5000 cwt. In 1812 the stock of swine was not more than 46,408, and they are not now estimated at more than 48,000. Of goats there is but a scanty supply, about 8000; and even of poultry, the quantity fed is inadequate to the wants of the country. The number of bee-hives is about 10,000, and they are kept almost exclusively in the sandy districts where hens occur. Game is becoming scarcer every day. Fresh-water fish, such as carp, pike, and eel, are not found.

Wood, which is one of the staple products of Brunswick, has been so seriously injured by neglect and waste, that all the woods and forests have been placed, since the year 1827, under the control of a public board. Their most extensive sites are at Helmstedt, Mansfeld, Lippe, and the Weser, where the felling and preparing of timber, and the working it into utensils and for other domestic purposes, employ a vast number of hands. The most common kinds of wood are beech, fir, pine, and oak. Of oaks there are 71,000 in the district of the Weser alone.

The mines of Brunswick are of two classes; one class comprising such as are worked in conjunction with the Hanoverian government, and the other independently of it. In the former are annually wrought out of the mines of the Ramelsberger, in the Upper Harz, has ever since the year 1788 been divided into seven shares, of which Hanover takes four and Brunswick three; and the shares accruing to the latter party, one year with another, according to the yield of the mine. The Ramelsberger is a mine of gold, copper, 52 of lead, and 70 of litharge, 115 of zinc, 955 cwt. of vitriol, 954 cwt. of sulphur, and 80 cwt. of potash; to which must be added 85 lasts (about 164 tons) of salt from the works at Julius-hall. These mines are under the direction of a joint stock company at Gutersloh, the proprietors being three of the copper, and lead, and three copper and sulphur works. The net yearly revenue, which Brunswick derives from this partnership, is not estimated at more than 2000l. sterling. The "Communion-Harz" also includes a high furnace and two other smaller mines, both in the Harz forest. The Independent mines lie on the Lower Harz, in the principality of Blankenburg, near Seesen, and the district of the Weser; their principal produce is iron. They give employment to 11 large works, which annually yield on an average about 20000 tons of iron, 865 of cast iron, 1600 of rod iron, 450 of flattened iron, &c.; 500 of raw and 1520 of cast steel, 45 and upwards of tin plates, and 420 cwt. of iron wire.

Brunswick produces marble (near Blankenburg), alabaster, limonite, and in some parts of the county, serpentine, stone, agate, jasper, chalcedony, garnets, porphyry, sandstone, freestone, coal (near Helmstedt), and in other places, where there are beds more than adequate to supply the whole duchy with fuel, and alum. There are four saltworks; namely those near Zahlberg (1300), Schöningen (1300), Saltzseihenbad (800), and Juliusithau (250); the last-mentioned forms part of the Communist Harz. Cobalt and ochre are obtained from the Ramelsberger.

The first census of the pop. of Brunswick, which was made in the year 1760, stated it to amount to 158,980 souls; in 1788, it had increased to 184,708; in 1793, to 191,713; and in 1795, to 209,527. But we are not enabled to speak of the present pop. of Brunswick, as we have no one have been made public since 1812 and 1830, when the number of inh. was 299,527 (101,598 males and 107,929 females) in the first-mentioned, and 245,783 in the last-mentioned year. Of families there were 11,459 in 1803. In 1815 there were 135,269; these in the present year may be said to amount to 250,000 souls, of whom about 150,000 belong to the 748 sq. m. forming the northern, and 100,000 to the 777 sq. m. forming the southern possessions of Brunswick. Out of the 28,000 houses, about 7200 are in towns. Independently of the town and village population, we must not omit the military and naval forces. The peasantry use the Low German, and the townspeople and persons of education the High German dialect. In 1830, a classification according to religious persuasions (Allgemeine-Verwaltung) was compiled, from which it appeared that the number of Lutherans was 45,241,745, and there were subject to the consistory at Wolfsbüttel, 6 general and 29 local superintendentships, and divided among 238 par. and 262 auxiliary flocks, in which were 398 churches and chapels. The Reformed Lutheran Church had at that time 165 followers and one place of worship; the Roman Catholic faith, 2386 followers and three churches (at Brunswick, Wolfsbüttel, and Helmstedt); and the Jews, five synagogues. There were some families of Herrntheaters then resident in the duchy. The value of all ecclesiastical property was estimated, in the year 1812, at 1,560,000 (332,920 dollars), and the incomes of benefices at 17,975 (130,000 dollars). Of these beneficiaries, the duke of Brunswick then held the patronage of 116, landowners of 44, magistrates of 10, prelates of 46, parishes of 10, and foreign nation one. The Duke of Brunswick has long been the endowments for the reception of unmarried females at Steyerburg, Wolfsbüttel, Brunswick, Helmstedt, and Goalar, which had been suppressed by the Westphalian government in 1812, were reinstated in their properties in 1814, and opened in 1816.

The government has at all times paid great attention to the intellectual improvement of the people, nor has Brunswick had reason to regret the closing of her national university at Helmstedt and her seminary for candidates in divinity at Riddagshausen, both of which were suppressed.
by the Westphalian government in 1812. In return for the
advantages which she now derives from the neighbouring
university of Göttingen, and the exemption of 40 of her
youth from payment of fees at that school, she contributes a 
small sum of money and an annual gift of books. At the head of
her own establishments for the purposes of education are the
Lyceum, formerly the Collegium Carolinum, in Bruns-
wick, conducted by 19 professors, and frequented by pupils
from the higher classes of society. There are also the an
ercological and scientific faculties, each presided over by
five professors and a demonstrator; the agricultural insti-
tute; an upper gymnasia, pro-gymnasia, and a real-
gymnasia (for youths designed for commercial and other
ordinary pursuits), the whole three constituting what is
called the Real-Institut, and conducted by a director and
35 teachers. All these establishments, as well as the cadet
academy for the gratuitous education of 12 pupils for
military service, are in Brunswick. There are gymnasia
also in Wolfenbüttel, Helmstedt, Blankenburg, and Hol-
zheim. For the poorer classes there are 3 schools of
industry, 32 civic schools, and 435 country or parochial
schools in the duchy. The Jews have likewise 2 schools
for youth of their persuasion. There is a museum, with
collections in natural history and numismatics, &c.; a
picture-gallery in Brunswick; and a public library at Wol-
fenbüttel, containing upwards of 200,000 volumes and
10,000 MSS., pamphlets, &c.; besides libraries and cabinets
in the capital and in other towns.

The constitution of Brunswick is a limited monarchy, the
federal districts and counties having no political existence.
A decree of the 12th of October, 1832, the sovereignty passes to the female, upon the failure of the male line, and the heir apparent comes of legal age on attaining his eighteenth year. The legislature is com-
pounded of the duke, an upper chamber consisting of 6 prelates
and the 78 holders of erasian estates, and a lower chamber composed of 6 prelates, 19 deputies from towns
(6 from Brunswick and 1 from every other town), and as
many representatives of the land-holders, who do not possess
the title of estates. No minister of state can be a representa-
tive of the province; and the upper committee of ministers
and the permanent committee of representatives acts as a legislative organ.
No law can be enacted without the consent of the chambers;
they have the right of proposing new laws to the duke, of
exposing defects or abuses in the existing institutions of the
country, and of impeaching the ministers, and even the
permanent committee itself, for violations of duty. In certain
cases, particularly of imminent danger to the state, they may
meet without being regularly called together. The legis-
lature must be assembled once at least every three years in the
country; and every point connected with the finances, and
indeed with the administration of national affairs, is
regularly presented to parliament by the duke, who presides at
the
lature. All Christian persuasions, if tolerated by the law,
joy equal protection and an equality of civil rights; and
they are all placed under the general superintendence of the
government. The property of the church, schools, and
charitable endowments cannot be diverted from its original
destination, nor can it be incorporated with the property of
the state.

There are three ministers of state appointed by the duke;
and there are four hereditary grand dignitaries—an earl
of the house of Calenberg, a bishop, a duke of Brunswick,
and a chamberlain. There are provincial boards in each circle
for its local government and police.

The revenue is derived, in the first place, from the ducal
demesnes, monopolies, &c., which yield a net income of
about 54,729L (839,000 dollars), out of which, by the sell-
ment made between the duke and the chambers in October,
1832, 32,590L (237,000 dollars) are applicable to the civil
list. The next source of revenue is the direct taxes, which
produce about 173,940L (1,265,000 dollars); and the last
and most important is the yield of the tobacco, 
(1,080,000 dollars). The net income of Brunswick from these
three sources averages, therefore, about 348,425L (2,534,000
dollars) in each triennial period, after deducting the civil
list expenditure; but to this there is yet to be added the
yield of the state's revenue from the excise, about
71,750L (525,000 dollars); and with this addition, the
net income for three years will be about 420,175L (3,054,000
dollars), or rather more than 140,000, per annum. In fact,
the estimate, as sanctioned by the chambers, for the expen-
siture of the duchy in the triennial period, 1834 to 1836,
amounted to 8,356,028 dollars; of which 5,075,576 dollars
were assigned to defraying the expenses of the military,
and about 63,870L (46,555 dollars) to the redemption of the national debt, which amounts to about
455,000l. (3,600,000 dollars). The disbursements on accoun-
t of the 'church and education' are paid out of the
domestic revenue. In addition to the annual stipends of
scholastic endowments, which produces a net yearly
sum of about 46,830L (346,600 dollars). Estimating the
pop. at 250,000, it would appear from these data, that each
individual contributes on the average a sum of about
174.4d. per annum, or 124.6d. per annum in the state every three
years, or about 12s. 6d. per annum.

The military establishment consists of the quota of men
which the duchy is bound to furnish to the tenth corps of
the army of the German confederation; namely, 1625 in-
fantry, 298 cavalry, and 172 artillery and pioneers; making
a total of 2096.

The mineral resources of Brunswick afford extensive em-
ployment for the labouring classes; but are also employed in
the spinning of yarn and weaving of linen. Yarn is spun
all over the duchy, and forms an important branch of
industry both in the country and in the towns; the
greater part is made into linen, and some is ex-
ported. The linen manufacture occupies employed above 2000
weavers, but it has greatly declined of late years. In
Brunswick and other towns quantities of stockings; and in the northern parts the pean-
sanity make their own with a species of cloth, half
of woolen and half of linen yarn, which is thence termed
'beiderwand,' or union cloth. Oil is almost wholly a pro-
duct of the duchy; bees and keeps 170 bee-houses, from
which about 300 tuns are obtained. Paper is manufactured
in 16 mills, to the extent of about 5000 bales; and with
the view of maintaining a regular supply, the exportation of
rags is prohibited. The number of gypsum works is 18, lime-
kilns 47, and tile and pottery manufactories 22. Earth-
brick houses and tile, and all tiles and faience are
made in Hanover. Heidelberg Castle contains a large china manufactory at Fürstenberg,
and glass and mirrors are made in the parts adjacent to the
Weser. The manufacture of woollens is small, and prin-
cipally carried on at Brunswick; ribbons are made in Bruns-
wick and Wolfenbüttel; soap is mostly manufactured at
Holzminden. The breweries, including the celebrated
'Mumm' brewery at Brunswick, have very much declined;
and the same remark applies to the once extensive tobacco
manufactures in Brunswick, Wolfenbüttel, and Holzminden.
The number of tobacco factories is 277, and it is worked by horses 6: besides these, Brunswick possesses 51
saw and other mills.

The duchy having no coast or navigable streams, its trade
with foreign parts is naturally cramped; the chief portion
of its commerce is still with the trading stations on the
Hanseatic League, and this arises from the transit of merchandise between the Hanse
towns and the interior of Germany. The chief articles of
home manufacture which are exported consist of yarn,
linen, grain, oil, chieco, madder, leather, timber, hops, and
branwne, the estimated value of which does not at present
exceed 150,000l. per annum. The importations are princi-
pally composed of colonial produce, raw materials, fish,
beaver, cheese, cattle, &c. (Venturini's 'Duchy of Bruns-
wick': Crono, Hassel, Stein, Meathus, &c.)

The inhabitants of this country are by some supposed to be descendants of the
Saxones or Cherusci, the former of whom were at an early
date settled on the lands which lie N. of the mouths of the
Rube and Weser, and the latter, in the time of their greatest
power, spread themselves over the whole of the Harz
mountains. Other writers, admitting this descent in part,
claim it also in favour of the Bructeri Majores, whose
easterly settlements lay close upon the banks of the Weser,
as well as of the Angrivari or Angri, who dwelt on both
banks of the river. At all events it seems to be well
ascertained that these tribes inhabited different parts of the
territory of Brunswick, and that the great northern
antagonist of the Romans, Arminius, was a Saxon,
whose native home was the banks of the Weser. In this
territory are the ruins of the city of Harsburg (Cebria Is. Tact.
Annal. II. 16), on which Arminius with his allies, who
had thrown off the yoke of Rome, met with a
signal overthrown from Drusus in the beginning of the first century. Monuments of the independent spirit of these warlike people are found at this day at the foot of the Ruhr, and even the chieftain who first founded the Weser both on the Brunswick and Hanoverian soil.

At a later date the Wends settled in these parts, and traces of their name still exist in Wenderell, Wendeburg, and Wendhausen, estates within the borders of the duchy. The Wends are mentioned by the ancient historians as being in the land of Germany, a branch of which is now seated on the British throne, derive their descent from Albert Azio I., margrave of Este in Italy, who died in 964. His great grandson, Albert Azio II. of Este, who held the sovereignty of Milan, Genoa, and other dominions in Lombardy, had for his first wife Kunigunda, daughter of Guelph II., who died in 1036, and was of the blood of the Altorfs, counts of Swabia. His son by this marriage, Guelph the First (more properly the Fourth), became possessed of the dukedom of Bavaria and founded the junior house of Guelph, to which the house of Brunswick traces its origin. This prince, who inherited the whole of the possessions of the Guelph family from his maternal uncle, died in 1101. Guelph II. (or V.), his eldest son, married in 1089 the celebrated Countess Matilda, but was divorced from her some years afterwards and married childless in 1112. His inheritance devolved to his brother, Henry the Black, whose union with the daughter and heiress of the last duke of Saxony brought him a considerable accession of territory in Lower Saxony. This prince was succeeded in 1125 by Henry the Proud (or Welfen), who, upon the death of his only daughter, the only daughter of Lotarius II., heiress of the vast possessions of the Billsings, added to the dukedoms of Bavaria and Austria, Brunswick, and the duchy of Saxony, by which acquisitions he became the most powerful sovereign in Germany. A Hohelstein and Mecklenburg was stripped by the ban of 1179 of Bavaria, Saxony, Austria, and other possessions in the S., and allowed to retain only his domains in Lower Saxony, consisting of Lüneburg, Calenberg, Göttingen, Grubenhagen, and the duchy of Brunswick-Wolfenbüttel. This was the death blow to the supremacy of the Guelphs. As Henry's eldest son was become, by marriage, count palatine, and his second son, Otho, had died on the imperial throne in 1218, William, a younger son, succeeded on the death of his elder brother in 1219, and by a praiseworthy act of generosity, the death of this prince, became the founder of the present dynasty, by virtue of his solemn investiture with the territory of Brunswick as a fief of the empire in 1235, on which occasion he was recognised as the first duke of Brunswick, Holstein, and Calenberg. William, who died in 1277, founded the elder branch of the Lüneburg house, which became extinct in the person of William of Lüneburg in 1369. In this way Magnus of the Chain, a great grandson of Albert, who died in 1373, united the possessions of each dynasty, which became the joint ancestors of the houses of Brunswick and Lüneburg. Of these two lines that of Brunswick, which in 1503 had split into the Calenberg and Wolfenbüttel branches, became extinct with Duke Frederic Ulrich in 1609. The other, which, by marrying into the House of Holstein, 1446, inheriting the principalities of Brunswick and Lüneburg as surviving representative of the intermediate line, was the founder of both branches of the existing dynasty; but the inheritance was again divided at his decease, by which partition Henry, his eldest son, established the line of Brunswick-Wolfenbüttel in 1569, and William, his younger son, established the line of Brunswick-Lüneburg. It was a descendant of the last-mentioned prince, Duke Ernest Augustus, who was raised to the dignity of ninth elector of the empire in 1592; and was succeeded in 1613 by his son Henry the Younger. Augustus ascended to the crown of Great Britain in 1714, by virtue of his descent on the female side from James I. Augustus, who acquired some celebrity as a writer under the designation of Gustavus Selenus, removed his residence from Hitzacker to Wolfenbüttel, where he founded the great library in that town. At his decease, in 1666, he left behind him three sons, the youngest of whom having had the sovereignty of Beornings assigned to him, founded the line of that name; his elder brothers became joint rulers of the remaining territories of Brunswick-Wolfenbüttel, and having in 1671 put an end to the personal union of the two,年内 taught the citizens to recognise them as their masters. Upon the death of the elder of the two brothers, Anthony Ulrich, who built the town of Salzdahlen, became sole ruler. On his death in 1714, he left two sons behind him, Ernest Augustus, who reigned in Calenberg, and George Augustus, who reigned in Wolfenbüttel, and Lewis Rudolphus, who made Blankenburg his capital, but afterwards removed to Wolfenbüttel, the decease of Augustus having re-united the disjointed principalities in 1731. As Lewis had no male heirs, Ferdinand Albert, of the line of Ernest I., succeeded in the dukedoms in 1735. Lewis Ernest, the third son of this prince, held the rank of field-marshal in the service of the Dutch states from 1759 to 1766, during which period he was captain-general of the United Provinces, and acting guardian of the hereditary stadtholder; the jealousy however of the patriotic faction exiled him to Bois-le-Duc, much to the prejudice of the welfare of Holland, and he died there in 1788. His next brother, Ferdinand, who entered the Prussian service, distinguished himself greatly in the Seven years' war, died the battle of Prague, and in 1757, at the head of the Prussian army in Westphalia, gained the victories of Corchfeld and Minden, and drove the French out of Westphalia, Lower Saxony, and Hesse-Cassel. The father of these two princes, Ferdinand Albert, after a reign of seven years, was succeeded by his son Charles, who transferred the seat of government to Brunswick in 1754, and there founded the celebrated ' Collegium Carolinum.' He was the steady and active ally of England during the Seven years' war, but at the expense of the peace and prosperity of his states as well as of his exchequer, which was embanked with a debt of nearly one million sterling in consequence of this alliance. He extinguished, however, one fourth of it before his decease, in 1760, when his son, Charles William Ferdinand, succeeded him. This prince, who had been educated as a soldier, at the head of the army, was brought up in the circumstances of a prince of the blood, and was by birth heir to the French crown, but as a prince of the blood, he was not a soldier, and was transferred to the command of the Prussian army in France. He had the good fortune to be present, in 1759, at the battle of Krefeld, during the Seven years' war, was instrumental in gaining the victory of Krefeld in 1758, and was acknowledged by Frederick the Great to be one of the first captains of his day. He married Auguste, princess of Wales, in 1764. At the close of the Seven years' war the domestic interests of his exhausted possessions afforded him a new sphere of action, in which, by the extinction of its debts and the wisdom of his general government, he showed himself as well fitted to govern a country as to command an army. Previous to 1745 the Spanish marriage was the object of a commission in the Prussian service as general of infantry; in this capacity, in 1787, he took the command of the Prussian forces, marched into Holland, and reinstated the Stadtholder in his dignity. In 1792 he was called upon to lead the Prussian army against the revolutionaries, and was sent to join the expedition against Pesth, which was no sooner completed than it was broken up, and the army was ordered to return to its old quarters. This was the signal which called forth the Younger Augustus to the charge of the business of the state, and so indifferently supported by his Austrian allies, that he determined to resign his command. He accordingly withdrew to Brunswick, and continued to employ himself with the cares of domestic government until Prussia called upon him to lead her troops into the battle of Austerlitz in the year 1806. The duke weighed down by years, unaccustomed with the improved science of modern warfare, and at the head of an inexperienced army physically inferior to the enemy, closed his distinguished career by the loss of battles at the Battle of Austerlitz, and was made a prisoner, broken-hearted and mortally wounded, to Ottsen near Hamburg, where he died on the 10th of November following. His duky fell a prey to Napoleon, and was incorporated with the new kingdom of Westphalia. His son William II. was married to Princess Maria Theresa of Saxony, and during the campaigns of 1792 and 1793, as well as in 1806, and had succeeded to the collateral inheritance of Brunswick- Celia in Prussian Silesia, remained an exile from his native
dominions until the Russian campaign shook Napoleon's power. The retreat of the French armies from the N. of Germany and the realisation that the possession of his Brunswick sovereignty in December of that year. But little time was afforded him to set it in order, for the renewal of hostilities with France in 1815 calling him into the field, he put himself at the head of his garrison, composed of French and Dutch prisoners, of allied forces in Belgium, and bravely fell in the conflict at Ligny on the 16th of June. From that day until his son Charles came of age, George IV. of England, (who had married Caroline of Brunswick, the sister of William Frederick), then prince-regent, advanced the arraignment of Brunswick as an appointed guardian. Charles, after a transient misrule of about five years, was forced in September, 1830, by an insurrection in the city of Brunswick, to seek safety by a precipitate flight from his capital; and under the resolution of the Confederation of the 2nd December following, he was succeeded by his brother, William prince of Oels, who assumed the government on the 20th April, 1831.

BRUNSWICK, the capital of the Duchy, which lies upon both banks of the Ocker, was known long before the times of Henry the Lion as a mere farm called Brunswick, belonging to the incumbency of St. Magnus. That prince, who was his real founder, divided the town into three quarters. It became the Hanseatic town until the middle of the 15th century, was accounted the chief town in Lower Saxony; but its prosperity declined with that of the Hanse towns. It is at present the residence of the Brunswick sovereigns and their seat of government. The fortifications were leveled in 1757 by the conqueror of the Seven Years war. Its area, which includes Richmond, the duchy's seat, Eisenbüttel, and the Münzberg, occupies about eight sq. m.; the town itself is divided into 6 districts, contains about 101 streets, 3400 houses, and 3600 inhabitants. Among the 10 churches are the cathedral, which are monuments to Henry the Lion and Matilda his consort, and the vault of the ducal family; and St. Andrew's, the steeple of which is 316 ft. high. The chief public buildings are the duke's palace (a new structure in course of completion), the old palace, consisting for the admiralty, navy-ultimate, the chair-tower, chancery, house of legislative assembly, mint, arsenal, ducal exchequer, opera-house, town-hall; trades-hall, old Altdorf town-hall, pack-house, Collegium Carolinum, and general and lying-in hospital. Between two of the gates (the Augustus and Steinhöre's) a handsome obelisk 60 ft. high, was erected in 1822 to the memory of the two dukes who fell in the campaigns of 1806 and 1815. The establishments for education consist of the college, founded in 1415; a gymnasium, and seminary; a college of agriculture, and a college of mechanics. The city of Brunswick is 157 59' N. lat., 10o 29' E. long.

BRUNSWICK, a town in Cumberland, N. Y., situated on the river Androscoggin at the falls, 26 m. N.N.E. of Portland, in 43o 59' N. lat., and 69o 52' W. long.

A canal established at this town, was incorporated in 1794; it derives its name from theHon. James Bowdoin, who endowed it with 6000 acres of land in Lincoln County, in the same state, and with some other property. By the legislature of Massachusetts this college was further endowed, with six townships of land, and an annual grant of 3000 dollars was made for its further support. This money payment was continued for a few years by the legislature of Maine after the separation of the state from Massachusetts. The college is built on a plain near the Androscoggin. It is under the legislative government of a board of 24 trustees, and the executive government of 58 overseers. The number of professors in 1834 was 10, and in 1835, 9, and there were 138 students. The college possesses a good philosophical and a chemical apparatus, a cabinet of minerals, and a library of about 8000 volumes, in addition to libraries belonging to the students containing 6000 volumes. A weekly paper called the Esquire was established by the students in 1826, and has since been regularly published. The town has the advantage of a considerable water-power, owing to the presence of several falls in the river. The town of Brunswick is employed in some mills and manufacturing establishments. The pop. of the town in 1820 was 2954, and at the census of 1830 was 3747.

BRUNSWICK, NEW. [New Brunswick.]

BRUNTISLAND. [Pars.]

BRUSSELS, called by the Flemings 'Brussel,' in Latin 'Bruxelles,' and by the French 'Bruxelles,' the capital of the kingdom of Belgium, in the prov. of S. Brabant, is in 50o 59' N. lat., and 4o 22' E. long.

Brussels is bounded on the north by a stream, a riv. which rises in the comm. of Naast, in Gheinault, and, flowing to the N.W., passes through Soignes and Steenkerque. Changing its course to the N.E., it enters S. Brabant, and flows past Hal to Brussels and Vilvorde, enters the prov. of Antwerp, and flows past Maastricht and Liége. The Senna enters the city of Brussels by two branches, one of which passes by the old market-place, and the other crosses the garden of the Chartreux. It forms four islands in the interior of the city, the two principal of which are called Sint-Servaas and Sint-Lambert. The width of the riv. where its different branches unite, at the fish-market, is about 30 ft., and its ordinary depth is 5 ft., which diminishes in summer, and increases considerably in winter. This riv. is not navigable in any part of its course. To remedy this inconvenience a large dike was thrown up in the river, and a channel was opened, through which the riv. was reduced to about 9 ft. of water. This riv. issues from Brussels, which is built on both sides of a canal, which issues from Brussels to the S. on the river Poite, in the prov. of Namur. Brussels is 100 ft. above the level of the riv. of Brussels, which difficulty has been overcome by means of 50 locks.

Another canal has lately been constructed between Brussels and Charleroi; the fall from the latter town to Brussels is 36 ft., and there are 15 locks. This canal commences at the Sambre, about 1100 yards above Charleroi. Near Hal it crosses the Sene by means of an aqueduct of three arches, and continues in a direct line towards Brussels, where, having repassed the Sene by another aqueduct of the same number of arches, it enters into the ancient fossé of the city; this can, was finished in 1830.

The greatest extent of Brussels from N.N.E. to S.S.W. is about one mile and a quarter, and its breadth about five-sixths of a mile. In form it is pear-shaped, the smallest part being to the N. The town is partly built on the side of a hill, which affords it a fine view of the country, and a scene of the utmost beauty. Brussels is full of charitable institutions, among which are a general establishment for the relief of the poor, 14 almshouses, 3 hospitals, a house of industry, and St. Leonard's, a spacious institution. The city of Brussels is in 50o 59' N. lat., and 69o 52' W. long.
Géry, so named after St. Géry, bishop of Cambrai, who built a chapel on the spot. It is said that the name of the city is derived from the bridge (called in the Flemish language brugh) which was thrown over the river. In the twelfth century the Bishopric of Cambrai included a castle in the island of St. Géry. The city was inclosed with walls in 1044 by Lambert Baldric, count of Louvain; but the walls were removed and the city enlarged in 1369. Two dreadful fires occurred in 1326 and 1405. It is said that on the second day of the fire 24,000 houses were destroyed. If these numbers are at all correct, the city must then have been of considerable size. The prosperity of Brussels was greatly increased in the twelfth century by the establishment of the manufactures of cloth and flax: that of fustian was introduced from Bruges and Ghent, and the latter from Normandy.

The first siege to which the city was exposed occurred in 1213, when it was taken by the English. In 1314, in consequence of incessant and long-continued rains, a contagious disorder carried off so many of the citizens that 60 were buried in the same grave. In 1370 the Jews were banished from the city and prov., and their property, amounting to more than 12,000,000 of florins, was confiscated.

Brussels was taken by surprise in 1488 by Philip of Cleves. On regaining possession, the emperor Maximilian, surnamed Philip the Handsome, in 1498, deprived the city of various privileges, which were bestowed upon Malines. In 1489 Brussels was visited by the plague, which prevailed to such a degree that the people died in the streets. By a similar visitation in 1578, more than 27,000 inhabitants fell a prey. The treatment of the city by the French general, duke of Alba, occasioned about 10,000 artisans to leave Brussels in 1567, many of whom settled in England.

In 1695 this city was bombarded by Marshal Villeroi, who demolished upwards of 4000 buildings, including the stadhuis and the Palace of the Dukes of Brabant. It was besieged by the elector of Bavaria, but was relieved by the army under the duke of Marlborough. In 1746 Brussels was taken by Marshal Saxe, who laid the inns under heavy contributions: it was restored to Austria at the peace of Aix-la-Chapelle. In the year 1794, the city was conquered by the French in the early part of the war of the French revolution. Brussels was declared by the directory to be the chief place in the dep. of the Dyle. On the 1st of February, 1814, the Prussian army took possession of this city just after the provisions of the treaty signed the same year, became one of the capitals of the newly-formed kingdom of the Netherlands. On the separation of Belgium from Holland at the revolution of 1830, the movements leading to which began in Brussels, this city became the capital of the independent kingdom and the new parlement of Belgium. Brussels contains about 300 streets and squares, besides numerous lanes and courts. Several of the streets are wide and airy; the houses are lofty and well built, and great care is taken to preserve their external cleanliness and neatness. The road leading to the city is the principal one, and the Place de la Grand-Place, situated in the centre of the city, is a regular parallelogram, surrounded on all sides by handsome buildings. The Hôtel de Ville and the halls of many trading companies occupy two of the sides. Other squares, the Place Royale, Place du Marché aux Pots, and the Place Saint-Michel, are remarkable for the regularity and beauty of their buildings. Among the ornaments of the town are the public fountains, 29 in number, erected in different parts, which supply the inh. with water. One of these fountains, that in the salon, contains a large group of statues of the twelve apostles, which, when finished, was erected in 1751, under the will of the earl of Aylesbury, "as an acknowledgment of the enjoyments he had experienced at Brussels during a residence of forty years."

Churches.—The city contains twelve churches, eleven of which are appropriated to Catholic worship and one to the reformed religion: there is also a synagoge. Among the Catholic churches is the cathedral church of St. Gudule, a Gothic building in the form of a cross, with two large square towers and a low, bold entrance building; it was begun in 1010; it contains a very remarkable pulpit, made of oak, and representing in bas relief the expulsion of Adam and Eve from Paradise. The tombs of several of the dukes of Brabant and numerous paintings are also in this church. The church of Notre Dame des Victoires was founded in 1134; it contains some fine statues by Du Quesnoy, and a marble altar designed by Rubens, besides several paintings by eminent masters. The church of Notre Dame des Victoires, built in 1288 by the first duke of Brabant to commemorate a victory obtained over the bishop of Cologne, is an ornamented Gothic building with painted windows, and contains many valuable paintings and statues. The Protestant church formerly belonged to the convent of the Augustines.

Public Buildings.—The Hôtel de Ville, one of the finest Gothic buildings in the Netherlands, was begun in 1401, but was not finished till 1442. The tower, which is stated by several authors to be 364 ft. high, is surmounted by a gilded colossal statue of St. Michael, 17 ft. high, which serves as a weathercock. The palace of the Fine Arts, situated in the Place Royale, was formerly the residence of the governors of Brabant; at present it contains a museum of paintings, statues, engravings, and drawings, from the Italian, French, and Flemish schools of art. The library, which contains nearly 100,000 volumes, besides numerous manuscripts, is open to the public five days in every week.

The king's palace in the Place Royale, near the park, was built in 1784, for the residence of the governor of the Austrian Netherlands. Opposite to this palace is the hall of the Chamber of Deputies, which was formerly the palace of Justice. The palace of the prince of Orange is a modern building, which was finished for the residence of the prince in 1787.

The most admired quarter of Brussels is called 'the Park.' About a century ago this was really what its name denotes, being then stocked with deer and other animals. The area, about 17 acres, now consists of three wide parallel avenues of trees, the middle one of which is kept well cut, in order that the walks may be always dry. In one of these avenues, which is opposite the king's palace and the hall of the Deputies, are several busts of Roman emperors, sculptured in blue stone; many of these were mutilated during the conflict that occurred in the park at the revolution in 1830. The city is lighted with gas.

In the year 1784 an order was given by the Emperor Joseph the Second, forbidding the burial of any persons within the city, and directing the formation of burial- places outside the walls. Several were accordingly established, one near the 'Hal' gate, another by the Flanders gate, and the third, which is the largest, by the Louvain gate. In addition to these, the English inh. of Brussels had established two cemeteries, one on the road leading to the vil. of Erpek, and the other in the vil. of Gent.

The manufacture of lace is carried on to a considerable extent; the quality is very superior, and large quantities were formerly used in England. Many other manufactures are also prosecuted, among which are hats, stockings, calico, mohair, fustians, hard-ware, and various chemical preparations used in the arts.

The pop. of the city was 84,004 in 1825, and 98,579 in 1850. The revolution which occurred in the latter year caused many mercantile men and persons attached to the old régime to remove to the country, and from Brussels to the Dutch provs., so that the pop. of the city was temporarily diminished. Other causes have since brought a considerable influx of inh., so that in 1835, when a census was taken, the numbers were found to be augmented to 102,703. It appears from the following figures that this augmentation has not proceeded from the natural increase of the people, but is rather to be ascribed to the attractions which in every country invariably draw considerable numbers from the country to the capital.

Deaths
1824 3,812
1825 3,763
1826 3,923
1827 3,801
1828 4,117
1829 3,948
1830 3,988
1831 4,022
1832 3,705
1833 4,117
1834 4,230

Marriages
1824 3,029
1825 3,146
1826 3,078
1827 3,029

1830 4,028
1831 3,348
1832 4,277
1833 3,863
1834 3,863

The ages of the persons who died in 1834 were as follows: 1116 under 1 year; 706 from 1 to 5 years; 183 from 5 to 10; 93 from 14 to 20; 283 from 20 to 30; 210 from 30 to 40; 243 from 40 to 50; 210 from 50 to 60; 292 from 60 to 70; 278 from 70 to 80; 156 from 80 to 90; 16 above 90 years; 1 age unknown; total, 3863. French is now the
has sufficiently proved in opposition to the assertion of Moreri, having early lost his father and elder brother by the cruelty of Tarquin, seized imbecility of intellect, in consequence of which, he was guilty of several imprudent and hazardous, through unknown lands, and seas yet more unknown, and Brutus, a name which Lucius Junius had received cut of contempt, accompanied the young princes, more as a buffoon to assist in their amusement, than as a companion to share the perils of their journey. On his entrance into the temple the offering which he made to the god was a bar of gold enclosed in a staff of cornel-wood hollowed for its reception, and intended to be emblematic of the votary's own situation. When the princes had finished their comment, he inquired in the gastronomic youth which they should reign at Rome hereafter. A voice from the adyton replied, 'That one of you shall obtain sovereignty at Rome who shall first kiss his mother.'

Titus and Aruns, in order to deprive their brother Sextus of participation in the chance-agreed to mutual secrecy and to the decision by lot of their own precedence. Brutus with more sagacity affixing a different interpretation to the response of the oracle, pretended to stumble, and kissed the earth, when he had fallen, as the common mother of all men.

After the atrocious violence offered by Sextus Tarquinius to Lucretia, Brutus was one of her kinsfolk whom the injured matron summoned to hear her complaint, and to witness her suicide. He plucked the reeking dagger from her breast, and threw aside the throwing aside the semblance of fatuity which he had hitherto assumed, he solemnly devoted himself to the pursuit and punishment of the whole race of Tarquin, and the abolition of the royal name and power at Rome. The populace was easily excited to insurrection. Brutus carefully avoided any personal interview with Tarquinius Superbus, who was detroned and exiled, and on the change of government which followed, himself and Tarquinius Collatinus, widower of Lucretia, were made the chief magistrates of the newly formed government. This institution was established in 1815, and is under the especial patronage of King Leopold.

The mean temperature of Brussels throughout the year 1833, as ascertained by observation at the Royal Observatorio, is 56.2° Fahr. The least cold occurred in January, when the centigrade thermometer stood at 24.73, equal to 76.9° Fahr.; the greatest cold occurred in January, when the centigrade thermometer stood at 3.23, or 26.9° Fahr. Observations on the atmospheric pressure during the same year show an establishment (on the 8th January) 775.29 millimetres, or 30.523 inches. The minimum pressure was observed in September, when the pressure in the barometer stood at 728.10 millimetres, or 28.556 inches. The mean pressure was 750.67 millimetres, or 29.554 inches. The number of days on which it rained was 150; there occurred 39 days of frost and 25 of frost and snow; it hailed on 5 days and snowed 11, and there were 7 thunder-storms during the year. Of these occurring in June and the same number in July. The present temperature was 58° Fahr. and the thermometer stood at 192 degrees, or one-half the year. From the E. N. and E. S., it blew 104 days; from the N. 30; from the S. 25; and from the N.W. 24 days.

Brussels is the seat of the supreme court of justice and of the council of appeal. The assizes for the prov. of S. Brabant are held in the city four times in each year. The city of the festival of the king, built in 1782, by the Archduke Albert. This palace stands in a fine situation, commanding view of Brussels and its environs. [BELGIUM, SOUTH BRABANT.]

(Gautier, Voyage dans les Pays Bas; Vander Maelen, Recueil des Documents Statistiques; Staten Uitgeven door de Commissie voor de Statistiek, 1839; Official Papers laid before the Legislature Chambers of Belgium, 1834.)

(Gautier, Voyage dans les Pays Bas; Vander Maelen, Recueil des Documents Statistiques; Staten Uitgeven door de Commissie voor de Statistiek, 1839; Official Papers laid before the Legislature Chambers of Belgium, 1834.)
Such is the story of Lucius Junius Brutus given by Livy (i. 56, Sec. ii. 1—6). A public funeral was decreed to him; the matrons of Rome, in honor of the champion and avenger of Lucretia, wore mourning for him during a year. He journeyed to Plutarch, a chosen statue with a sword in his hand to his mother, and placed together with those of the kings. (See Niebuhr's Roman History, Vol. i., 'Commentary on the Story of the last Tarquins.')

For this, the writer has drawn a tragedy on the history of Brutus, disguised by the plying love of Tullia, a daughter of Tarquinus, for Titus, the son of the consul; and an earlier dramatist on the same subject, Madile, Bernard, in a play under the same title, acted with great success in 1647, makes both the sons of Brutus in love with a daughter of one of the Albin, Brutus' own rank. It appears that on the death of Valerio, a daughter of the Consul Valerius, as enamoured with Titus, who does not acknowledge any mutual flame.

BRUTUS, DECIMUS JUNIUS, is believed to be the son of a father of the same name, who was consul A.D.C. 76.

On his adoption by Julius Postumius Albinus he took the name of the family into which he was received, so that he sometimes appears on medals as Albinus Brutus filius. Shakespeare has called him Decius, and both that poet and Voltaire in many particulars have conformed him with Marcus Porcius Cato. It is clear that Brutus is his name; but it is plain from the share which he took in the murder of the Dictator how deeply he enjoyed his confidence, and how extensive was the influence which he exercised.

On the ides of March, when all things were prepared for the assassination, it is only necessary to mention the intervention of Caesar that he should not attend the meeting of the senate, being deterred by some evil dreams which had visited both himself and his wife Calpurnia, and by indisposition. D. Brutus was employed to dissuade him from the resolution, and had some difficulty in overcoming the soothsayers, by showing Caesar that the senators assembled by his orders would think themselves insulted if they were dismissed on pretexts so frivolous, and above all by assuring him that it was intended on that day to nominate him consul. Caesar, it is said, was so touched with the speech that he might wear a crown except within the limits of Italy. (Plutarch, Cesar, ivx.)

The affection which the murdered Dictator bore to Decimus Brutus was exhibited in his will, in which he named that false friend among other persons to inherit his fortune in case of the failure of direct heirs. Caesar also had appointed him commander of his cavalry, consul for the succeeding year A.D.C. 711, and governor of Cisalpine Gaul, in which province Brutus attempted to maintain himself on the basis of the aristocratic principle. The Roman Senate, by which he hoped to support his authority were chiefly framed of gladiators, who gradually deserted; till Brutus, fearful of being left alone, after having been defeated at Mutina, endeavoured to make his way to the army in Greece. For some time he was hindered in the pursuit of his object, and attempted to pass through Aquileia to Illyricum. Although well acquainted with the language of the country which he traversed, he unfortunately fell into the hands of some banditti. Having inquired of his captors to which of the Gaulish petty princes Brutus belonged in which he had been taken, and having heard that it was ruled by Camillus, a chieftain whom he had formerly obliged, he was entreated to be led to his presence. Camillus received him with apparent goodwill, and sternly rebuked the robbers for having injured so great a man; but to Antonius, whom he had secretly corresponded at his capture, he employed far different language. Antonius, affecting compassion, refused to see the prisoner, and ordered Camillus to put him to death, and to send him his head. (Appian, De Bellis Cisalpinis, iii. ad fin.)

BRUTUS, MARCUS JUNIUS, son of Marcus Junius Brutus, by Servilia, sister of Cato of Utica, was born at Rome A.D.C. 656, B.C. 86. He was traditionally descended from Lucius Junius, the expeller of the Tarquins, a descent asserted by himself in a memorial commemorative of the actions of the repulsive, and also announced by Dionysius of Halicarnassus. A passage in the 1st Philippic of Cicero (c. 6) corroborates this opinion by stating that the expeller of kings, L. Brutus, has propagated his stock through 500 years, in order that a descendant might emblaze his virtues, by again freeing Rome from regal domination. But this allusion, which suited the purpose of Cicero, is only a rhetorical flourish. Plutarch, in the beginning of his life of M. J. Brutus, assumes his descent from the first Brutus, conformably to his practice in such cases, without troubling himself as to the credibility of the fact. He is sometimes stated, and Q. Cato Minor by both Cicero and Dion Cassius, and also on several of his coins, as Brutus, Procos, or Imp. occurs. He owed this name apparently to his adoption by his maternal uncle, Q. Servilius Caepio. On an unjust divorce from his first wife, Appia Claudia, he married Postumia, widow of Bibulus, and daughter of his maternal uncle Cato, under whose inspection he had been most carefully educated in philosophy and letters, after the loss of his father, who was put to death by Pompey in the war between Marius and Sylla. Plutarch says that he was not accompanied by all the Grecian systems of philosophy, but particularly attracted by the tenets of Socrates; and at least, he certainly adopted the Stoical tenets and discipline. When Cato, B.C. 59, was appointed under a law passed by the influence of Clodius to annex Cyprus to the Roman empire, Brutus accompanied his uncle, and during his residence in that island he appears to have been guilty of certain pecuniary extortions by no means consistent with integrity, but perhaps too much countenanced by the habits of the times.

When civil war broke out between Julius Caesar and Pompey, Brutus sacrificed his private resentment in a cause which he believed to be the better cause of the two, and appeared under the banners of the latter. After the defeat of Pompey at the battle of Pharsalia, Brutus was particularly distinguished by the clemency of the conqueror, who assigned to him lands, and pardoned him an injury to himself. However, he was distanced by the jealousy of his colleague, and Bartus, who had married his sister, and to Deiotaros, king of Galatia, for the latter of whom Brutus pleased in a set oration. Scandal attributed these acts of grace to a remembrance of his marriage with Julius Caesar. Brutus, however, to the life of Servilia; and a false report was circulated that Brutus was a son of the dictator. But the words which Suetonius has put into the mouth of Caesar when he perceived Brutus among his assassins, 'And are you among them, my son?' is rather, it is said, a personal allusion than as any acknowledgment of consanguinity. Brutus was only 15 years younger than Caesar himself.

When Caesar undertook his expedition into Africa against Cato, he committed to Brutus the government of Cisalpine Gaul, which was administered with the utmost prudence, and he afterwards preferred him to Cassius in a rivalry for the post of Praetor Urbanus. Notwithstanding these distinguished favours, Brutus was one of the principal assassins on the Ides of March. He retired to Athens, when Marcellus was defeated by Pyrrhus in the battle of Philippi, in Macedonia. The battle was fiercely contested, and Brutus, being mortally wounded, unwillingly to survive his defeat, fell upon his own sword, ascribing his death from Brutus, when he heard of the deed, that he was 'the last of the Romans.'

Brutus, in a second battle fought not long afterwards near the same spot, obtained a partial victory, but perceiving himself surrounded by a detachment of his enemy's soldiers, and in danger of being made prisoner, he despaired of ultimate success, and after more than one of the friends about him had declined the painful duty, he delivered the signal for the end of his life. And alluding to himself on its point, expired in the 44th year of his age.

Of his works, which were much praised by contemporaries, it is not certain that any have descended to us. His eulogy on Cato is certainly lost; some few letters in Greek, which are probably not genuine, have been printed in the collections of Alcius, Cujacius, and H. Stephen. He is said to have made a kind of an abstract or epitome of the history of Polybius, of the annals of C. Fannius, and of the history of L. Coelius Antipater. His Latin letters to Cicero have been preserved which in barbarous style, it is said, which he 'cannot read without astonishment.' His authenticity on the other hand is strongly supported by Conyers Middleton in answer to an attack by Tanstall. But Ruhnken expressed his opinion against them, and also F. A. Wolf.

When Brutus and Cassius were about to leave Asia for their Macedonian campaign, it is said that an apparition
admonished Brutus of his approaching fate. Brutus was of a spare habit, abstemious in diet and in sleep. One night, when he was overcome by watching, and was reading aloud in his study, from one o'clock till early morning, the whole army around him lay wrapped in sleep and silence, he thought he perceived something enter his tent and saw "a horrible and monstrous spectacle standing silently by his side. "What art thou," he said, "that dost thou the God of man, and art thy business with me?" The spectator answered, "I am thy evil genius, Brutus. Thou wilt see me at Philippi!" to which he calmly replied, "I will meet thee there. When the apparition was gone he called his servant, who, when he saw that his lord had no face, and spoke nor seen any vision. He communicated his adventure on the next morning to Cassius, who professed the philosophy of Epictetus, and argued on the principles of his sect against the existence of such beings as demons and spirits; or, admitting their existence, denied that it was possible for them to assume a human shape or voice, or have any power to affect us; in fine, he attributed the whole incident to sleeplessness and fatigue, which, as he justly remarked, suspend and pervert the regular functions of the mind. On this account, Brutus, that the spectacle again appeared and assumed its former figure, but vanished without speaking.

Plutarch also remarks that there is a diversity in the statements respecting the death of Portia; that Nicolas the philosopher and Valerius Maximus affirm, that being prevented from suicide by the constant vigilance of friends who surrounded her, she snatched some burning embers from the fire and held them in her mouth till she was suffocated; if however we admit the story of a leech, attributed to Brutus, this account must be a fabrication; for he laments in it the death of Portia during his own lifetime, describes her distemper, and praises her conjugal affection. (Plutarch, Brutus, cap. 53.)

Voting, wrote the tragedy, 'La Mort de César,' from which, contrary to the usage of the stage, he excluded all female characters. His plot is founded on an hypothesis which we have shown to be false, that Brutus was the son of Cæsar; and although the play abounds in fine lines, it does not appear to have been by any means successful. (Plutarch's Brutus; Apian, lib. 15, 16; Cicero's Letters and Orations; Dion Cassius.)

BRUYÈRE, JEAN LA. Notwithstanding the well-merited popularity of La Bruyère's works, scarcely anything is known of his private life. No greater eulogium, perhaps, can be passed upon philosophy than that he who had so acutely observed the inconsistencies, foibles, and passions of mankind, should have left few or no traces of them in himself. La Bruyère was born in 1645, near Bourbon, in Normandy. After filling the office of treasurer of France at Caen he removed to Paris. He was appointed teacher of history to the Duke de Bourgogne, under the direction of Bossuet, and passed the remainder of his life in the service of his pupil, in the quality of homme de lettres. In 1687 he was admitted into the French Academy on the 15th June, 1693, and died of apoplexy at Versailles on the 10th of May, 1696.

He is represented by the Abbé d'Olivet as a philosophe, whose happiness consisted in passing a life of tranquillity, surrounded by his friends and his books, in the choice of both of which he showed considerable judgment. He was polished in his manners, but reserved in his conversation, and free from pretension of every kind.

Of all La Bruyère's friends, Bossuet, to whom he had attached himself from a sense of gratitude, sympathized with him the least in character. Several anecdotes connected with those times give a faithful picture of their walks in the delightful gardens of Versailles, and represent with striking effect the imperious and acute La Bruyère, and pictures of his conversation and deportment of his companions. It was, no doubt, gratitude to his friend that betrayed him into the weakness of using his pen in favour of the Bishop of Meaux against Fénélon in the absurd affair of Quietism. Upon this theological controversy, they appear to have been more intimately acquainted than we should suppose familiar to a man like La Bruyère, he left some dialogues; and if we cannot wholly excuse him for having written them, we must admit that he showed his good sense by not publishing them. Among the somewhat large sacrifices which he thought it essential to make to the prevailing opinions of the day, his work frequently gives indications of a bolder manner of thinking—the precursor of the philosophy of the succeeding century. It even appears to have been his wish to let posterity into the secret of his prudent dissimulation, for he states his character, in a passage just quoted, as having been born a Christian and a Frenchman. Great topics are interdicted him. He enters upon them now and then, but soon turns aside to minor subjects, to which he imparts an interest and an importance by his genius and his style.

Since it was this twofold relation of subject of Louis XIV. and of Christian (he ought rather to have said Papist) that imposed upon La Bruyère the trammels of which he complains, it may be inferred, that notwithstanding his cold eulogies of the absolute monarch and his gloomy theology, he was not to be described as an apologist for the abuses of Popery which so strongly characterized the age of Louis XIV. The persecutions which rewarded the generous and liberal principles advocated, in his Télémaque, by the amiable Archbishop of Cambrai, whose domains had been completely even as those suffered by Malère, the inimitable delineator of the 'Tartuffe,' turned La Bruyère aside to less dangerous subjects, to the details of social, and the follies of private life. Malignity, however, assail him, even within the narrow limits of his book, but it is confined only to himself, of criticism on the morals and the habits of his time. In comparison with his 'Characters,' he showed the book to M. de Malèrè, who said 'this will procure you many readers and many enemies,' a prediction which was fully accomplished, for while the book was received with avidity the moment it appeared, intentions were attributed to the author of which he was certainly innocent. The originals of La Bruyère's portraits were discovered, as it was impudently pretended, and their names were published in a key to the Characters, which thus formed a kind of scandalous commentary, in which the persons denounced could not complain that they were calumniated, though they were held up to public ridicule.

La Bruyère is, perhaps, the only French moralist familiarly read in his own country. His observation, though rarely profound, is always judicious, natural, and nicely phrased. It is true, if his views of human nature are often too extreme, he ample compensates for the deficiency by the closeness of his inspection. He places the most trye and common characters in a new and unexpected light, which strikes the imagination, and keeps attention alive. Perhaps he too often affects strong contrasts and violent antitheses, and in wishing to avoid sameness he falls into the error of attempting too much variety, in which he loses his individuality. His style is characterised by strong powers of delineation, and the talent of a great painter must undoubtedly be conduced to this end, and he was not altogether free from the charge of occasional affectation.

If it be true, as has been remarked, that Theophrastus,* whose work was studied and translated by our author, may be said to have formed La Bruyère, it must be admitted that this is the highest praise that can be given to a modern author. But to compare, as some have done, the characters of the Greek with those of the French philosopher, is the height of absurdity: nothing is more false than this manner of drawing parallels.

It is impossible to judge rightly or even to understand the Characters of Theophrastus, without possessing accurate notions of the political, moral, and social condition of the

* Sequel de la Bruyère's pamphlet Dialogues upon 'Quietism,' continued and published by Louis Ediss Dupin, Paris, 1699, 10me.

† Histoire de l'Académie françoise published in France the first translation of the "Characters" of La Bruyére; (1615) and 1627, and in 1689, 1689; it has been forgotten since the appearance of that by La Bruyère in 1689. There are three other French translations of Theophrastus, by P. C. Le Royer, 1780; another by Mehill De Balz, 1790; another by Cover, 1799.
people whose features they represent. Voltaire showed his
kind of knowledge when he said that Aristophanes
was neither a poet nor a humorist. Shakespeare and Mo-
lière necessarily require commentators (at least, to be
thoroughly elucidated). But if we consider the obser-
vation of Louis of France, whom our forefathers shall undertake to criticise them, they must first
study the reigns of Elizabeth and of Louis, in order to avoid
erush decisions and ill-founded judgments. If we compare
for a moment only the political and social position of the
Autocrat of Morocco and the King of France, whose
pride and ostentation men of all ranks in France obse-
quiously bowed; if we identify and familiarize ourselves
with the respective circumstances under whose influence
the two authors wrote,—we shall no longer entertain
the idea of comparing Thomas of Le Blanc with La Bruyère: the same
resemblance between them consists in the minuteness and
accuracy of their observation, and in the justness and spirit of
the strokes by which each has delineated his characters.

La Bruyère's work, stamped as it is with the impress of a
sound judgment and a good-natured satire, is one of those
friends whom we always consult with pleasure and advan-
tage. It anticipates our knowledge of the world and per-
fects it; and although the manners and characters therein
delineated may undergo changes and modifications, its in-
terest will be always the same, because, like all great works
which take nature as their basis, it will always be true.

BRUYN, BRUIN, BRUN, or LE BRUN, CORNE-
LIUS, for his name is printed in different books in all
these ways, was a painter and traveller of some eminence.
He left his native country in 1668, in order to see in his
native country to explore by rather a novel route Russia,
Persia, the Levant, and the East Indies, and he did not
return home for many years. His first work, Voyage to
the Levant,' was published in 1671. It relates to his travels
in Russia, Persia, Turkey, Cyprus, Scio, and Asia Minor, and is embellished with
more than two hundred engravings, representing eastern
cities, ruins, natural productions, costumes, &c. All
these plates were executed from drawings made by himself on the
spots, and attest his good taste, his natural bent for truth
and nature in them. His second work, Travels
through Muscovy, in Persia, and the East Indies,' was
published at Amsterdam by the brothers Wetstein in 1718;
it contains upwards of 300 engravings, and is also in folio.
Many of these plates, representing eastern ceremonies,
antiquities, animals, birds, fish, plants, and fruit, are
admirably executed. Several of the engravings are devoted
to the ruins of Persepolis. On the whole these are two
splendid books. Another edition of the second work was brought out at Amsterdam, 1719, 4to. In 1728, this
work was reprinted in London, 8vo, and is valuable on account of corrections and notes made to the
text by the Abbé Banier, but with this French edition we are
unacquainted. In this second work the reader may
find much information concerning the coasts of Arabia, the
islands of the Red Sea, as well as to restorations. At Batavia, where there were many Chinese colonists, he
carefully investigated some of the manners and customs of
that extraordinary people. He was residing on that island
when the English buccaneer William Dampier, or, as he
calls him, the famous Captain Dampier, arrived there from
Ternate, after a most extraordinary voyage and series of
adventures. [DAMPIER.] The value of Bruyn's second work
is further increased by an account of the route taken by M.
Isbarnus, the ambassador of Muscovy, through Russia and
Towards India.

In 1714, the year in which he published his first
work, Bruyn put forth in Holland a very small disputative
treatise, entitled Remarks on the engravings of old Per-
sepolis, formerly given by Messieurs Chardin and Kempt-
er, and the mistakes and errors in them clearly pointed
out. In this pamphlet he defends himself for the dif-
ferences between the plates of his own work and those of
Chardin, and shows in what portions of the engravings his
own are the more correct. His Remarks are in Dutch,
his travels in French; but the 'Remarks' were afterwards translated into French, and published in an appendix to
his second great work in 1718.

The compilers of cyclopedias and biographical dictionaries
have gone on repeating one after the other, and evidently
without looking into the old traveller's books, that, though
curious and instructive, Bruyn is inelegant in his style, and
not always exact in his facts. Now in reality his style,
though exceedingly simple, and somewhat deficient in
warmth and picturesque beauty, is very far from being
inexact, and his elegance, a quality he had in common
with so many old travellers of his nation, is everywhere
admirable. For the fidelity of his descriptions of most of
the places he visited, as well as his own personal observation. He was not cedulous himself,
and he several times censures the credulity of explorers
who had preceded him.

BRYAÇE, N. a name sometimes given to the natural
order Musci.

BRYANT, JACOB, was born at Plymouth in 1715;
his father, who held a post in the custom-house of that town,
was transferred in the seventh year of his son's age to Kent,
in which county Jacob Bryant received the first part of his
education at Luddesdown near Rochester, whence he was
afterwards removed to Eton. Having been elected to King's
College, Cambridge, of which society he became fellow, he
graduated A.B. in 1740, and A.M. in 1744. Being early
distinguished for his attainments and love of letters, he was
appointed tutor to Sir Thomas Stapylton, and after a stay
at the Marquis of Blandford's and his brother Lord Charles
Spencer, at that time at Eton. A complaint in the eyes
obliged him for a short time to relinquish this occupation,
but having returned to it, he was rewarded in 1756 by the
appointment of secretary to the Duke of Marlborough, whom,
continuing his patronage when nominated Master-General
of the Ordnance, took him as a secretary and travelling
companion during his command in Germany, and gave him
a lucrative situation in his own public office. His circum-
cumstances at this time are described by him with
forthrightness and wit, in his letters to literati, and twice refused an office which has frequently been
much coveted by others—the Mastership of the Char-
terhouse.

The history of his life is embodied in that of his publica-
tions, all of which are distinguished by learning, recentness
and acuteness, but are more or less disfigured by fanciful
conjectures and wild speculations. His first work was
Observations and Inquiries relating to various Parts of
Antient History, Cambridge, 4to, 1767. In contradiction
of the belief of Bentley, he conceives Thucydides' history
to be a very imperfect, most difficult, and false
thing, contends that the wind Euroclydon, mentioned in
Acts xxvii. 14, ought properly to be termed Euroquilo;
and in opposition to the same writers, together with Clu-
verius and Beza, he affirms that the island Melite, men-
tioned in the last chapter of the same book, is not Malta.
The remaining subjects treated of in this volume are
very obscure and very remote from common inquiry. He
pro-
posed to throw light upon the earliest state of Egypt;
upon the Shepherd Kings; and upon the history of the
Aegyptiaca. He published, in 1773, a small volume in 4to,
and was followed by a third volume in 1776.
Bryant

Besid-

the nations whose history he had formerly investigated,
he now turned to the Canaanites, Hellenians, Ionians,
Lolgos, Dorians, Pelasgi, Scythia, Indoeucausc, Ethio-
pia, and Phenicians; pressing his service every scattered
fragment which his extensive reading enabled him to col-
clect, and supporting his arguments by numerous forced
and oftentimes false etymologies. One of his hypotheses
was
that as all mankind sprang from the same stock, all existing
nations bear a resemblance to one another. To bring this
to the simplest radical terms was therefore, as he contended,
the only sure means of discovering truth. He believed also that the
heathen mythology was framed entirely upon perversions of the
patricianal history as recorded in the Old Testament;
and, as has been well said, he saw the Ark in every thing.
This publication involved him in much controversy, which
he undertook in part anonymously, and in part, particularly
in defence of the Apamean medals, in the Gentleman's
Magazine. The Apamean medals were struck in honour
of Alexander Severus, in A.D. 238. At the last day his
decrees on the gods, a raven, a dice, and the olive-
branch, and the legend NOE. This treatise was
published separately in 1775, in 4to.; and Eckel, the
most learned numismatist of his time, declared in its favour.
In 1780 Bryant published, with his name, a tract
which he had before printed and recollected, entitled
Vindiciae

Flavianae,' advocating the disputed testimony of Josephus
our Saviour. Priestley expressed himself as convinced
by
the arguments in favour of the passages; but he afterwards engaged in controversy with Bryant on the difficult subject of Necessity. Bryant was a firm believer in the authenticity of the poems attributed to Rowley, and in 1781 he published two orations, "An Eulogy on the Genius and Virtues of Theocritus," and "A Defence of the Poet," against the charge of plagiarism by Theocritus. In 1783 the Duke of Marlborough printed for private distribution an account of the gems in his own collection, the 1st vol. of which was written in Latin by Bryant. In 1792 appeared a treatise 'On the Authenticity of the Scriptures, and the Truth of the Christian Religion,' svo, executed at the request of the dowager Lady Pembroke; and two years afterwards, in svo, some 'Observations on the Plagues inflicted on the Egyptians.' But the work which engaged him in most dispute, and was more distinguished by his love of research than any other which he produced, was suggested by M. Le Chevalier's description of the plain of Troy. It appeared in 1796, 4to., and was entitled 'A Dissertation concerning the War of Troy and the expedition described by Homer, with the view of showing that no such expedition was ever undertaken, and that no such city in Phrygia ever existed.' It was scurrilously answered by Wakefield, and it provoked far more honourable replies from Mr. Morriss and Dr. Vincent. In the following year appeared a tract in svo, entitled 'The Sentiments of Philo-Judaus concerning the Greek APOSTLE.' Besides these, Bryant also wrote 'Observations on famous controversial Passages in Justin Martyr and Josephus,' and a pamphlet addressed to Mr. Melmoth. He closed his literary life by preparing for the press some remarks on very curious Scriptural subj. His last work comprised thirty pages, Zingaria or Gipsy language; and numerous juvenile or fugitive pieces were found among his papers in MS. The titles of some of them will sufficiently show that his pen was not always devoted to subjects of a grave nature. We need only mention a 'Dissertation on Pork,' and an 'Apologia of a Cat.'

His exemplary and protracted life was closed at his own residence at Cyepnham, near Windsor, on the 14th of November, 1804, in consequence of a hurt which he received in the leg by a chair slipping from under him while taking down a book from an upper shelf. Such a death, as has been well remarked by a French biographer, was for a literary man to expire on the field of honour. His merits are very justly eulogized in a note on the second 'Dialogue of the Schoolmasters.'

BRYNNATHON, or BRYNNATHON, is a plant formerly much employed in rural pharmacy, but now disused. It is a perennial with large fusi- form succulent roots, which have a repulsive nauseous odour. From the axil of the leaves springs a hairy branching stem, which climbs among bushes by means of its tendrils, in the manner of a cress, to which it is botanically allied, both belonging to the natural order Cucurbitaceae. The leaves are palmate, and rough on both sides with ciliate points. The flowers are small and whitish, with pale green veins, and are succeeded by little red berries, containing a very few seeds. Its principal use was on the French coast of Picardy, the historic "brin de Broyne" under the name of the French call, from that circumstance, Nœud du Diable, or Devil's Turnip. It is excessively bitter, and when dried purges in doses of 30 or 40 grains. Over doses are extremely dangerous, and even sometimes fatal. Its properties are apparently owing to the presence of a principle called bryonine, analogous to cathartine, which exists in about the proportion of 2 per cent. of the root.

Bryony-root should be gathered in the autumn, after the stem has turned yellow; it is cut into slices, which are strung upon a thread, and hung up to dry on northern coast, called bryonine, analogous to cathartine, which exists in about the proportion of 2 per cent. of the root.

Food. Young roes and fawns, hares, moles, rats, mice, winged game, frogs, lizards, and beetles.

Nest. In the hollows of rocks, in old castles and other ruins; where the female lays two or three, but rarely four, round white eggs. Latham says two, 'the size of those of a hen.'

M. Cronstedt, who resided on a farm in Suedermeania, near a mountain, had an opportunity of witnessing the devotion of these birds to their young, and their care in supplying them with food, even under extraordinary circumstances. Two eagle owls had built their nest on the mountain; and a young one, which had wandered away, was taken by the servants and confined in a hen-coop. The next morning there was a dead partridge lying close to the door of the coop. Food was brought to the same place for fourteen successive nights: this generally consisted of young partridges newly killed, but sometimes a little tainted. Once a moorowl was brought still warm under the wings, and at another time a piece of lamb in a potrid state. M. Cronstedt sat up with his servant many nights in order to observe the deposit of the supply, if possible, but in vain. It was evident however to M. Cronstedt that the parents were the caretakers, and on the look-out; for, on the very night when M. Cronstedt and his servant ceased to watch, the usual food was left near the coop. The supply continued from the time when the young owl was taken—in July—to the usual time in the month of August when these birds leave their young to their own exertions.

Below gives an account of the use which falcons made of this bird to entrapp the kite. They tied the tail of a fox to the eagle owl, and let him fly. This spectacle soon excited the attention of the kite, if he were near, and he continued to fly near the owl, not endeavouring to hurt him, but apparently intent on observing his odd figure. While so employed the falconer surprised and took the kite.

There are specimens in the gardens of the Zoological Society in the Regent's Park. In the museum of the Royal College of Surgeons there is a preparation (No. 1749) of the vitreous and crystalline humours of the eye of this species, showing that the vitreous humour has a distinct capsule, part of which is reflected from its outer surface; and another (No. 1755) showing the remarkable prolongation of the anterior segment of the eye, which assumes in consequence a tubular form. The horny plates of the sclerotic are co-extensive with this segment to maintain its peculiar shape, and to afford a firm basis for the support of a very large and prominent cornea. No. 1798 shows the eye-ball meditating membrane and their muscles, with the external eye-lids and Harderian gland.

AMERICAN SPECIES.

Bubo Virginianus. The Virginian Horned Owl. Strix Virginiana of Vieillot; Due de Vieillot of Buffon; Neotony-omissive of the Cree Indians, according to Mr. Hutton; Oscewakcho of the Cree, the plains of the Saskatchewan, according to Dr. Richardson.

Pennant (Arctic Zoology) says that this seems to be a variety of the eagle owl, although he notices the inferiority in size: but it is a distinctly specified species; the name is now obsolete, as Dr. Richardson observes, that this night-bird, peculiar to America, inhabits that continent from end to end. Cuvier gives his opinion that the Strix Megallanica of the Planchee Enluminées differs merely in having browner tints of colour; and Dr. Richardson mentions the result of Mr. Swainsen's comparison of the North American specimens with those of the Table Land of Mexico, as confirmatory of the identity of the species; the only difference being a more general rufous and vivid tint of plumage in the Mexican specimens. Almost every part of the United States possesses this bird, and Dr. Richardson, in all the fur countries where the timber is of large size.

We have seen how the civilized Romans regarded the European bird; and it is curious to observe how, in a comparatively savage state, the same superstitious feelings were connected with the American species. 'The savages,' says Pennant, quoting "Colden's Six Indian Nations," 'have their birds of ill omen as well as the Romans. They have a most superstition terror of the owl, which they carry so far as to be highly displeased at any one who minces his bootings.' Lawson, evidently speaking of these birds, says 'They make a fearful halloing in the night-time, like a man, whereby they often make strangers lose their way in the woods.' Wilson thus describes the haunts and habits of the Virginian horned owl.—His favorite residence is in the dark solitudes of deep swamps, covered with a growth of gigantic timber; and here, as soon as the evening draws on, and mankinde retire to rest, he sends forth such sounds as seem scarcely to belong to this world... Along the mountain shores of the Ohio, and amidst the dense forests of Indiana, alone, and reposing in the woods, this ghostly watchman has frequently warned me of the approach of morning, and amused me with his singular exclamations. Sometimes sweeping down and around my fire, uttering a loud and swelling Waugh O! Waugh O! sufficient to alarm a whole garrison. He has other nocturnal solos, one of which very strikingly resembles the half-suppressed screams of a person suffocating or throttled.' Wilson treats this visitation like a philosopher; but, after reading his description and that of Nuttall (Ornithology of the United States), we shall cease to wonder at the well-told tale in 'Fauna Borasili-Americana' of the winter night of agony endured by a party of Scottish Highlanders who, according to Dr. Richardson, 'made their bowse in the recesses of a North American forest, and inadvertently fed their fire with a part of an Indian tomb which had been placed in the secluded spot. The startling notes of the Virginian horned owl broke upon their ear, and they at once concluded that so unharrow a noise must be the mourning of the spirit of the departed, whose reposes they supposed had disturbed.'

The following is Dr. Richardson's description of the plumage of a specimen, twenty-six inches in length from the tip of the bill to the end of the tail, killed at Fort Chesterman—

Bill and claws pale bluish black. Iris bright yellow. Facial circle of a deep black immediately round the orbit, composed of white mixed with black bristly feathers at the base of the head, and posteriorly of yellowish brown wing feathers, tipped with black, and having black shafts. The black tips form a conspicuous border to the facial circle posteriorly; but the small feathers behind the auditory opening differ little in colour and appearance from the adjoining plumage of the neck. Eregts composed of ten or twelve dark brown feathers, spotted at the base of their outer webs, and along their whole inner ones, with yellowish brown. Forehead and crown dark blackish-brown, finely
mottled with greyish white, and partially exhibiting the yellowish-brown base of the plumage. The whole dorsal plumage is yellowish-brown for more than half the length of each feather from its base, and dark liver-brown upwards, finely barred and indented with undulated white lines. More of the yellowish-brown is visible on the neck and between the shoulders than elsewhere. The primaries present six or seven bars of dark amber or liver-brown, alternating with six bars, which on the outer webs are brownish-white, finely speckled with dark-brown, and, on the inner webs, are of a bright buff-colour, sparingly speckled with the dark-brown near the shafts. The tips of the feathers have the same mottled appearance with the paler bars of the outer webs. The secondaries and tail feathers are similarly marked to the primaries, but show more white on their outer webs. There are six liver-brown bars on the tail, the last of which is nearly an inch from its end.

Under surface. Chin white, succeeded by a belt, extending from ear to ear, of liver-brown feathers, having pale yellowish-brown margins. Behind the belt there is a gorget-shaped mark of pure white. The rest of the lower surface of the body is crossed by very regular transverse bars of white, alternating with bars of equal breadth (three lines) of liver-brown, shaded with chocolate-brown. The yellowish-brown base of the plumage is likewise partially visible: there is a white mesial line on the breast, and when the long feathers covering the abdomen are turned aside, a good deal of white appears about the vent. The outside thigh feathers are yellowish-brown, with distant cross bars of liver-brown; and the legs and feet are brownish-white with brown spots. The linings of the wings are white, with bars of liver-brown, margined by yellow-brown. The insides of the primaries are bright buff, crossed by broad bars of clove-brown. On the under surface of the secondaries the clove-brown bars are much narrower. The under tail coverts are whitish, with distant bars of liver-brown. The under surface of the tail has a slight tinge of buff-colour, and is crossed by mottled bars of clove-brown.

of the base of the plumage was also less bright, and the facial circle was of a more sombre hue. Its bill, also, was more compressed.

The bird prefers, according to Dr. Richardson, on the American continent, the open woods of Hudson's Bay squirrel, mace, wood-grouse, etc., and builds its nest of sticks on the top of a lofty tree, hatching in March. The young, two or three in number, are generally fully fledged in June. The eggs are white.

Wilson observes that it has been known to perch on a man's arm, or to carry off chickens from roost. 'A very large one,' says that author, 'wing-broken, while on a foraging excursion of this kind, was kept about the house for several days, and at length disappeared no one knew how. Almost every day after this, he and chicken considered the fort to be the Spaniards. In the snug retreat were found the greater part of the feathers, and many large fragments of her whole family of chickens.'

There are specimens in the gardens of the Zoological Society in the Regent's Park. We cannot close this article without referring to the beautiful and very curious description of Bubo arcticus in 'Fauna Boreali-Americana.' It is not at all improbable that this may be the Strix scandiaca of Linnaeus. Of this Pennant, in his 'Arctic Zoology,' says that Linnaeus seems to have described it from a painting of Rudbeck's, adding, 'I am of opinion it could not be that species.' But Temminck considers this Scandinavian eared owl to be merely a snowy owl, on which two fictitious regrets had been placed.

The specimen of Bubo arcticus described by Dr. Richardson was observed breeding at mid-day in the immediate vicinity of Carlton House, and was brought down with an arrow by an Indian boy.

RUBON [Galbanaum.]

BUCCANEERS, a most numerous and well-known association of sea-robbers or pirates, who were also called 'The Brethren of the Coast,' and still more commonly 'Pirates.' The term Buccaneer is of curious derivation. The Caribbee Indians taught the colonists in the West Indies a singular mode of curing and preserving the flesh of cattle: when cured, this flesh was called Boucan caribbee: from boucan the French made the verb Boucher, which the 'Dictionnaire de Trevoux' explains to be 'to dry red, without salt.' Hence comes the noun 'Boucanier,' and our Buccaneer.

The term Buccaneer is supposed to be nothing but the French sailors' corruption of our word 'freebooter'; and it is a curious fact, that as we always used a word corrupted from them, so the French designated the robbers by a word derived from us, invariably calling them buccaneers, or freebooters.

The Buccaneers were natives of different parts of Europe, but chiefly of Great Britain and France. They were most of them seafaring people, and the origin of the associations about the year 1594 was entirely owing to the jealousy of the Spaniards, who would not allow any other nation to trade or settle in the West Indies, and who pursued the English or French like wild beasts, murdering them wherever they found them. At that time and long afterwards, Spain, in right of her priority of discovery, and of the well-known bull of Pope Alexander VI., considered the whole of the New World as treasure-trove of which she was lawfully and exclusively the mistress. Every foreigner found among the islands or on the coasts of the vast American continent was treated as a smuggler and robber, and this being the case it is no wonder that ensuing adventures soon became so, and returned cruelty by cruelty. As early as 1517, when an English ship appeared at St. Domingo to request liberty to trade, the Spaniards fired their cannon at her and drove her away. When this unexpected visit was repeated, the Spanish governor, an Austrian, sent out a sharp reprimand to the governor of St. Domingo because he had not artfully seized the ship instead of driving her away, and so disposed of the English that no one of
them should have returned to teach others of their nation the route to the Spanish Indies. But the enterprising nations of Europe were not to be checked by the tyranny of Spain, nor could a papal bull shut the eyes of navigators and make them blind to the improving science of navigation. In the meanwhile the world was opening to the view of Europe, moreover, still considered the New World as an Eldorado where gold and treasures were to be had for the fetching, and this made them brave the monstrous cruelties of the Spaniards. In 1526 one Thomas Tyson was sent to the West Indies as factor of the Spanish main, and many adventurers soon followed him. The French began to make voyages to Brazil, and the Portuguese and the Dutch successively began to show themselves in numbers in the West Indies. Knowing what they had to expect they chose accordingly to fight or to be conquered. Pigmies, ingeniously phrased, "se d’dommager d’avance," used by one of the French filibusters, it appears they did not always wait to be attacked, but in case of a favourable opportunity became themselves the assailants. To repress these interlopers the Spaniards employed guards-at-seas, the commanders of which were instructed to massacre all their prisoners. This tended to produce a close alliance, offensive and defensive, among the mariners of all other nations, who in their turn made descents on the coasts, and ravaged their trade, and reduced their commerce. The consequent state of hostilities was thus established in the West Indies entirely independent of peace or war at home. The Brethren of the coast cared not if their respective native countries in the Old World were at peace with Spain; in their necessities of war, or to conquer by force of arms, or to dictate, or relinquish the benefits which that immense region offered. When not engaged in traffic with the Indians or in predatory excursions against the Spaniards, the principal occupation of these men was hunting wild cattle, of which they were masters, and sowing fields, which were left to the various races in that part of the world, and took and sacked Mancebo and Gibraltar. Morgan displayed not only infinite bravery, but the highest qualities of a great commander; unhappily however, like most of his predecessors, he was treacherous, cruel, and bloodthirsty. He was in the habit of torturing and roasting alive in order to make them confess where they had concealed their treasures. The boldest and most astonishing of all Henry Morgan’s exploits was his forcing his way across the isthmus of Darien from the Pacific to the Atlantic Ocean. But his expedition opened the way to the great southern seas, where the buccaneers soon achieved strange exploits, and laid the foundation of much of our geographical knowledge of that country. In December, 1670, a vessel landing on board about 2000 men, rendezvous at Cape Tiberon under the enterprising Welshman, whom French and English obeyed with equal alacrity. On the 16th of Dec. he took the island of Santa Catalina, where he left a garrison and took several prisoners, and then landed at Lorenzo, at the mouth of the river Chagre, on the east side of the isthmus of Darien, where out of 314 Spaniards he put 200 to death. He left 500 men in the castle, 150 to take care of his ships, and with the rest, who, after deducting the killed and wounded, amounted to about 1200 men, he began his land march through one of the wildest and most difficult countries, which was then only known to the wild Indians. The fatigues and difficulties they suffered on this march were dreadful. On the tenth day after his departure from the place where he landed, the Spaniards made a combat with the Spaniards, who had 2000 foot and 400 horse, took and plundered the rich city of Panama, which these Spaniards had then to do it without disturbance. Having tricked most of the fleet out of their share of the spoils, he sailed for Jamaica, which was already an English colony. This dexterous ruffian was afterwards knighted by Charles II., and became the governor of the admiralty court in Jamaica, and deputy governor of that island.

In 1673 the Spaniards murdered 300 French filibusters, who had been shipwrecked at Puerto Rico—a barbarous act which provoked atrocious reprisals. The short way to the South Seas had been shown by Morgan, and, in 1680, about 300 English buccaneers started from the shores of the Atlantic to cross the Isthmus. The route they pursued varied slightly from that followed by
Morgan; but they had men with them more capable of describing what they saw. These were Basil Ringrose, Barty Sharp, William Dampier, and Lionel Wafer, each of whom, in after years, wrote and published an account of his adventures, with a description of the country. Although they formed an alliance with the Darien Indians, who hated the Spaniards, this expedition was not in sufficient force to attack Panama. Two hundred of them, however, having procured a supply of provisions and munitions of war, the rest, in the ships under Ringrose, attacked three large armed ships, took two of them, and began cruising in them. These fellows had even some diplomatic skill. Ringrose tells us that the governor of Panama sent to demand of Sawkins their captain; 'Why, during the whole time that England and Spain, both of them, were at war, how should men come into those seas to commit injury? and from whom they received their commission?' Sawkins replied, 'That he and his companions came to assist their friend the king of Darien, who was the rightful lord of Panama, and all the country therewith.'

The adventurers then proceeded to capture ships and plunder the towns along the coast, and some of them remained a long time in the South Seas, and made many discoveries.

In 1684 another expedition, in which also the skilful seaman Dampier and the surgeon Wafer were engaged, sailed from Virginia, and, stretching along the whole of South America, doubled Cape Horn and entered the South Seas to plunder the Spaniards. Many of these adventurers engaged in the trade of the rich ports of Chili, Peru, Nova Espana, and California, to the shores of China, Malacca, and India, and we scarcely know anything of the sort so interesting as Dampier's narrative of this expedition. [DAMPIER, The New Voyage to New Guinea.]

The conclusion of peace, established by the name of the 'Treaty of America,' which provided for the entire suppression of the buccaneer warfare, was concluded between Great Britain and Spain; but, as far as the buccaneers were concerned, this was a bit of waste paper, for, by far the most of their achievements took place after the date of the treaty.

The war between Great Britain and France, which followed the accession of William III., in 1688, did much more to relieve the Spaniards from the scourge. The French, without waiting for a declaration of war, attacked the English in the West Indies, where, for some time, the chief beligerents were those ancient allies and comrades, the ribesiers of one nation and the buccaneers of the other, who were now called privaters, and duly commissioned. The bonds of kinship were broken; they exercised upon each other some of the cruelties that they had exercised in common upon the Spaniards, and they never again confederated in any buccaneer cause. At one time, had they been properly headed, and had conquest, not plunder, been their object, they might, by dint of united force, have possessed themselves of such colonies as the West Indies—they might have once have established an independent state among the islands of the Pacific. Henry Morgan, in fact, at one time entertained this magnificent idea. The date was 1695. In 1696, the accession of a French Bourbon prince to the throne of Spain, brought about the final suppression of the buccaneers. Many of them turned planters or negro drivers, or followed their calling as sailors on board of quiet merchant vessels; but others, who had clippers, or good sailing ships, quitted the West Indies, and went cruising to different parts of the world. For nearly two centuries their distinctive character or function had been the constant warfare of war against the Spaniards, and against them alone, and now this was lost. 'After the suppression of the buccaneers,' says Captain Burnet, 'and from their relics, arose a race of pirates of a more desperate cast, so rendered by the increased danger of their occupation, who for a number of years preyed upon the Spanish shipping on the coast of our own nation, and continued plundering down, and, it may be said, exterminated. Within the few last years, however, many dreadful piracies have been committed in the Mexican Gulf.

The general history of the Objectors of America, by James Burney, F.R.S.; Lives of Banditti and Robbers, by C. Mac Farlane; The Buccaneers of America, by an old anonymous author; Dampier's Voyages; Lionel Wafer's, Basil Ringrose's and Barty Sharp's Narratives; and, in French, the works of F. De Pas, etc.

BUCCINA, a military instrument of the shrill horn, or cornet, kind, in use among the antelopes, and by some supposed to have been formed of the horn of the bull or goat. According to others it was the shell of the buccinium, a fish. Vegetius (De Re Militari) says that it was made of brass and bent in a circle. Blainville (De Ostracis, etc.) also states that it was a metallic instrument; but from the engraving he gives of it, after ancient bas-reliefs, &c., the buccina would appear to have been perfectly straight. Sir John Hawkins coincides in opinion with Blainville, and the work of the learned Italian. The probability is, that the buccina in its primitive state was a simple horn, and that subsequently it was formed of a more durable material.

BUCCINUM. [Entomostoma.]
this lordship of the Adriatic; and Foscarelli (Della Lettura Veneziana, lib. ii. p. 216) finds some trace of it in Dandolo’s Chronicle towards the close of the 10th century. It was not likely that the Vatican should demur to the canon established by the emperor Alexius III when he recollected the answer which the Venetian ambassador Domatii returned to Julius II, when that pope inquired where the grant of Alexander was to be found. He was requested to look for it on the back of the donation of Constantine.
The bishop having been consulted as to the day on which the feast of Ascension, from the ars at the piazza, received its splendid passengers. Accompanied by innumerable feluccas and gondolas it passed on to the mouth of the Lido amid the thunder of artillery. On coming in front of the port of Lido, there has been adopted the custom of the doge of Venice to cast a ring into the bosom of the Adriatic, betrothing her by these words, ‘We wed thee with this ring in token of our true and perpetual sovereignty.’ He then returned to the church of San Nicolo di Lido, and having heard a solemn pontifical mass in the church, he delivered his charge, and contained his cortège with a magnificent banquet in the palace.
Since the occupation of Venice by the French, the Bucentaur has been allowed to rot in the arsenal. Casebon (in Alterneur, vol. 2) who has been followed by Darby, notices the Venetian government as having decided to find a painting made to the sea by the Syracuseus of an elephant vessel filled with honey, flowers, and frankincense.

BUCEK, MARTIN, was born in 1491, at Schelstadt near Strasbourg, a town of whose modern fame what was of the Lower Rhine. His real name was Kuhborn (Cowhorn), which, according to the pedantic fashion of his times, he changed into a Greek synonym, calling himself Bucer. Having entered the order of Saint Dominick, he received in 1526, the degree of master of arts, and in 1528, the degree of doctor of divinity; but in 1529, he left Strasbourg, and went to Rome, where the Catholic Church had ordained, according to whose doctrine he taught divinity for twenty years at Strasbourg. At the diet of Augsburg, in 1548, he vehemently opposed the system of doctrine called the Interim, which the Emperor Charles V had drawn up for the uniformity of religious worship until a free general council could be held. On the insidious nature of that proposition we need not here dwell; and it may be sufficient to state, that although it was expressed for the most part in scriptural phrases, it favoured almost every disputed article of the Reformation, and was equally by the Romanists and by the Reformed; but the emperor urged its acceptance so fiercely, that Bucer, after having been subjected to much difficulty and danger, accepted an invitation from Cranmer to fix his residence in England. In 1551, the English Parliament declared that Bucer, but downright Popery, only a little disguised; and at the same time he wrote a book against Gardiner, chiefly relating to the celibacy of the clergy.

On his arrival in England, he was appointed to teach theology at Cambridge, and appears to have been much admired and respected. When Hooper accepted the bishopric of Gloucester, but refused to be consecrated in the episcopal vestments, Bucer wrote a most convincing but moderate treatise on this fastidiousness; and in the review of the Common Prayer Book, he expressed his opinions at large, that he found all things in the service and daily prayers clearly accordant to the Scriptures. He wished for a stricter discipline to exclude scandalous lives from the Lord’s Supper. He objected to that requisition which urged the people to receive it at least once a year (a practice still retained by the Presbyterian), and would have them press it much more frequently. He wished the bread to be placed in the hands, not put into the mouths, of the communicants; and he thought the prayer that these elements might become the body and blood of Christ favoured transubstantiation too much, and might, by a slight change, be brought nearer the words of Scripture. He condemned the administration of baptism in private houses, and he recommended frequent catechizing. It will be remarked that all these amendments have since either been adopted, or are such as the real friends of the Church of England approve.

The king having heard that Bucer’s health had suffered during his residence in England, he presented him with the sum of 20l. to procure one. In return, he wrote a book for Edward’s own use, ‘Concerning the Kingdom of Christ,’ which he presented as a new year’s gift. It referred the miseries of Germany to the want of ecclesiastical discipline, the want of religious effusion and faith in Christ, beginning by a more careful refusal of the eucharist to ill lives, by the sanctification of the Lord’s day, of holidays, and of days of fasting, which last he proposed should be more numerous and less confined to Lent, a season which which and penitence were intended. A book on non-residence and pluralities, the true remnants of Popery.

Bucer died at Cambridge in the close of February, 1550, and he was buried in St. Mary’s with great honour, his remains being attended by full 4000 persons jointly from the universities, and the church of England. His body was brought over his grave by Dr. Haddon, the public orator, and an English sermon was then preached by Parker, afterwards archbishop of Canterbury, to whom, not long before his death, he had applied in a very peremptory urgent letter for the loan of ten thousand crowns; and on the same day, Dr. Redman, master of Trinity College, preached at St. Mary’s a sermon in his commendation. Redman had differed from him much, especially on justification and preaching, and he added, that as Bucer had satisfied him in some things, so he believed, if he had lived, he would have satisfied him more; and that he being dead, he knew he was no more; and he knew he was not as fate.

An amusing story, recorded in the Life of Bishop Jewell, shows both the gentleness of Bucer’s disposition and the malice of his opponents. Catherine duchess of Suffolk having two sons at Cambridge, and herself occasionally residing there, would present him with a calf towards the maintenance of his family. The good-natured man was fond of these beasts, and often visited them in their pasture, an innocent recreation, which gave occasion to a report among his adversaries that the cow and calf were交 to him as a reminder of the falseness of his views; but when he was to read in the schools. On hearing this rumour, he by no means gave up his customary attention to his favourites, but once pointing them out to a friend, he observed with a jesting tone, ‘Behold, these are my masters, from whom I learn the things I teach my others; and yet they can speak neither Latin nor Greek, Hebrew nor German, nor talk to me in any other language.”

During the reign of Mary, five years afterwards when inquisitors were sent to Cambridge, the corpses of Bucer and of Fagius were dug up from the grave; and the parson, fastened erect by a chain to stakes in the market-place, and disgustingly burned to ashes; their names, at the same time, were erased from all public acts and registers as the names of friends of the true faith; and this violence to their memories continued till Elizabeth because of the very interesting collection of tracts relative to the life, death, burial, condemnation, exhumation, burning, and restoration of Martin Bucer, was published at Strasbourg, in 1572, by his friend Conradus. Among other matters, the Greek and Latin Epitheta which the members of the university, according to custom, placed on his coffin; and also the Encomium, written when he and Fagius were posthumously reinstated in their academical honours. On the title page of these testimonies of honourfills those than fifty pages.

Bucer wrote both in Latin and in German, and so largely that it is thought his works, if collected, would amount to eight or nine folio volumes. He was thrice married, and his first wife, by whom he had three sons and two daughters, perhaps selected by him, not very judiciously, in imitation of Martin Luther. It is by no means easy to decide respecting the terms on which he lived with that great reformer, but it seems, from an anecdote which Beelzeb has preserved (Cron. et ann. 1599), that Luther and Bucer had
with either unmannevered rudeness or with a bluffed familiarity which no intimacy could be close enough to justify. On one occasion, when Bucer and Goclenius laid him a view of his new sentiments and friendship for the reformed form of the Church, the latter, and when the former addressed him, he replied with a sort of smile (subridens aliquantulum), 'You are a rogue and a knave' (Tu es nequum et nebulo). Jortin, from whom we derive the story (Life of Erasmus, i. 390), underlines the importance of the event in an account to which Luther could not 'endure' Bucer. But the words are equivocal: subridens means chuckling as well as sneering, and is the term chosen by Virgil when he represents Jupiter godnianharmlessly attempting to soothe and found Venice. The word had been used by a playful or serious tone in which it was pronounced, and to this we have no guide. The Romanists hated Bucer as a powerful opponent; they abused him for extreme subtlety, and they seldom spoke of him otherwise than as a 'sly fox.'

**BUCEROS. (Hornbill.)**

**BUCH, a district of the Bordelais, in France, extending along the coast of the Bay of Biscay. Its capital was La Teste de Buch (now generally known by the simpler designation of La Teste), at the head of the Bay of Arcachon. Pop. in 1832, 2295 for the town; 2840 for the whole commune. This district is now included in the dept. of Gironde. Its first lords bore the title of Captain, and their lordship gave them several rights and privileges in the 13th century. The boroughs of Arcachon and Talence, two boroughs situated on the coast, were passed successively to the houses of Guishly, Nogaret-Epernon, Foix-Rainant, and Guillo. A Capit of De Buch, of the house of Guishly, distinguished himself in the wars in France in the fourteenth century; he served in the armies of Edward the Black Prince, under the duke of Guise, and of Charles le Mauvais, king of Navarre.

**BUCHAN, a district of Aberdeenshire, Scotland, which extends along the coast about 50 m. from the mouth of the Ythan to the boundaries of Banffshire. The shore is bold and rocky and the soil is of a various nature. Generally the agriculture is rapidly improving it, the extent of the waste lands and the comparative absence of trees give a bleak and barren appearance to the district. The hill of Mormond mounted is passed by every vessel that comes through the route of a white horse formed by paving white stones on its side has become conspicuous at a distance and a good sea-mark. The Ythan (the riv. which divides Buchan from Forfarin) after a course of about 22 m. falls into the sea at Newburgh; it was noted in former times at its head-firth. The most valuable pearl of the royal crown of Scotland is said to have been got out of it. The Ugie falls into the sea a mile N. of Peterhead. On the sea coast a few miles S. of Peterhead are the Bulfers of Buchan, a nearly round basin about 48 ft. deep and 600 ft. diameter; and the Buchan Bay which is the sea, towards which there is an arch by which the waves enter. It is open also at the top, round which there is a narrow path about 30 yards from the water: when the sea is high in a storm this scene is exceedingly grand.

For a peninsular rock of the coast stands Slains Castle, a tower house standing high above the sea, with a tower about 15 m. N. of Aberdeen. It was demolished by James VI. in 1594. Near it is the dropping cave or white cave of Slains, which is remarkable for its stalactites. On the first Monday of every month small debt courts are held alternately at Old Aberdeen and at Slains, and the cases decided for five years before 1821 was 53 a month.

**BUCHANAN, GEORGE, was born of poor parents, in the parish of Killearn, and county of Stirling, about the beginning of the year 1566. He had the third of eight children, who, by the death of their father, became the sole solvency of their grandfather, were early thrown upon the care of their widowed mother, and the friendship of more distant relations. By one of these, James Heriot, his ma- terialist in the expression of an extreme, and says that the university of Paris; where, however, he had not been two years, when his uncle dying, he was left in a state of such utter destitution that in order to get to his native country he was forced to join the corps then being raised as auxilia- ries to the Duke of Albany in Scotland. After a twelvemonth spent at home in the recovery of his impaired health, he again joined the troops in Scotland and continued to proceed with them to the siege of Perth; but the hardships which he suffered on this occasion reduced his youthful frame to its former state of debility, and he was confined to his bed the remainder of the winter, where he died of a sickness which his uncle, Patrick, his eldest brother, were entered students in the pedagogium, afterwards St. Mary’s College, of the university of St. Andrew’s. It is said to have been by the bounty of John Major, who had the gift to gole in Scotland, an ecclesiastical college, that the two brothers were maintained at this time. This is not unlikely. Buchanan was an exhibitioner when he passed bachelor of arts, on 3rd Oct., 1525; and we learn from him himself, that when Major went the following summer to France, which he had then been able to do, he went to the college at Paris, where, as he had obtained the degree of B.A. at St. Andrew’s, he was immediately incorporated of the same degree. This was on the 10th of Oct., 1527. The next year he proceeded M.A.; and the year following he was chosen protonotary of the German nation—a form of one of the students which comprehended those from Scotland. After a struggle of two years with the iniquity of fortune, as he expresses it, he obtained the situation of a regent, or professor, in the college of St. Barbe, where he taught Greek and Latin. The university of Paris, of which he had yielded him but a miserable pittance, and became tutor to Gilbert, Earl of Cassilis, a young Scots nobleman, who resided at that time in the neighbourhood of the college, his previous tutor, William, abbot of Crossragwell, having left. Buchanan was appointed in 1534 the tutor of the royal licence granted to that effect of 8th April, 1532. (Pitscarn’s Crit. Tribals, vol. i. p. 245). With that nobleman Buchanan remained abroad about five years, and in this period committed to the press his first publication, which was his Latin translation of the first four books of the Latin Grammar. In May, 1537, he came to Scotland in company with Lord Cassilis, who had just attained his majority; and, probably, by his influence, was then ap- pointed as the master of the Latin school for the natural children of James V., with a liberal allowance. * At Lord Cassilis’s seat, where he seems to have continued a visitant, he composed his poetical entitle Somnium, in derision of the regular clergy. The king, who had a turn that way, having ordered to be sent for some more satires of a like kind. He did so accordingly, and published among others his Palindria, and the Franciscana. These pieces brought upon his devoted head the vengeance of the church. He was seized as a heretic, and thrown into the galleys at Berwick; and there, after being transferred to the Bastille, the seat of some privy council, by the advice of his master of the school, he drew up a sum of money to consent to his immediate death. The aversious James might have rejected this brieve; but Bu- chanan happily escaped from his confinement and got to England, where, after a severe struggle with want and the toil of reclamation, he died at the end of 1540. Finding on his arrival that Cardinal Beaton was living there at that time, he gladly accepted an invitation from Andrew Govea, to become a regent or professor of Latin in the college of Guillaume d’Orleans. It appears that he was at Bordeaux before the close of 1540, and the 1st of Dec. that year he presented a poem in the name of the college to Charles V., when he made his solemn entry that day into Bordeaux. He remained here three years, and in the latter part of that time held the office of rector of the college, and several other minor pieces; but being continually harassed by the clergy under letters from Cardinal Beaton, who had traced his retreat, he removed to Paris, and from the year 1544 till about 1547 taught Latin in the college of the Chanoines de la Chapelle, with a pension of £10 a year from Turnebus and Muretus. In 1547 Govea was invited to become principal of the university of Coimbra in Portugal, and to bring with him learned men to fill the vacant chairs. Buchanan accompanied him on that occasion, and became a regent in the university; but having the misfortune to lose his friend Govea by death the following year, the in- quisition assailed him as a heretic, and after harassing him for near a year and a half, shut him up in the cell of a monastery, where, having nothing could confine or subdue his mind. On the 28th of April, 1557, he received the holy sacrament of communion, and was absolved and absolved Aug. 28, 1557, in the presence of the governor of the city of Lisbon. (Traverser’s Account, ep. Pitscarn’s Crit. Tribals, vol. i. p. 245).
of Buchanan. It was in this solitary abode he began his well-known 'Version of the Psalms.' Being at last restored to liberty, he embarked for England in a vessel then leaving the port of Lisbon; but the political state of that country bearing an unfavourable aspect, he soon quitted it again for France, which he reached about the beginning of the year 1553. The siege of Metz was raised about the same time; and at the earnest request of some of his friends he commenced that event in a Latin poem. He was soon after recalled to France, but it was only to be for a time. In the year 1555 he gave up that charge for the place of domestic tutor to Timoleon de Cossé, son of the celebrated Maréchal de Brissac. During his connexion with this family, which lasted till the year 1560, he published several poems, and invented a new mode of versification, which, called the 'Verse Acrostics of Euripides, and the earliest specimen of his paraphrase of the Psalms. In 1560 he returned to Scotland, where we find him in the beginning of the year 1562 classical tutor to the young queen Mary. For his services in this capacity he was given a weekly allowance of 500l. Scots a-year for life out of the temporalties of the abbey of Crossragwell; and in the year 1566 the Earl of Murray, his brother, to whom he had dedicated a new edition of his 'Psalter in Latin,' presented him with the place of principal of St. Leonard's College at St. Andrew's. The following year he was chosen Moderator of the General Assembly of the church of Scotland, which was still a more extraordinary homage to his character and various abilities. He was also, in the same year, by the election of St. Salvator's college, on being appointed one of the preceptors to the young King James, then in the fourth year of his age. The same year the place of Director of the Chancery was for his services conferred upon him, and soon afterwards that of Lord Privy Seal. This latter was a highly lucrative office, and entitled its holder to a seat in parliament. He retained it till at least 1578, when he nominally resigned it in favour of his nephew, Thomas Buchanan, of Tiber. In the same year, 1578, he was joined in several parliamentary commissions, legal and ecclesiastical, and particularly in a commission issued to visit and reform the universities and colleges of the kingdom. The scheme of reformation suggested, and afterwards approved of by parliament, was drawn up by him. The same year also he bestowed forth his celebrated treatise 'De Jure Regni Apud Scotas.'

Continued indisposition and the advance of age now warned him of his approaching dissolution. In his 74th year he wrote a brief memoir of his own life; when visited a considerable applause, and his house was thronged with visitors. Sitting in his chair teaching the boy that served him in his chamber the elements of the English language and grammar; and not long afterwards he expired, while his great work his 'History of Scotland' was passing through the presses. He had long been one of the richest men in Edinburgh, and was buried at the cost of the town, having by his many charities and benefactions left himself without means to defray the necessary charges of his burial.

As a man of great and various learning, and of nearly unceasing capacity, he was without a rival in his own day; and he is one of the most elegant Latin writers that modern times have produced. If we may judge from his Latin verse translations of the Medea and Alcestis of Euripides, he must also have been a good Greek scholar. He was a great man in his own eyes, and pursuing the knowledge in the most unfavourable circumstances, amidst poverty and disease, religious persecution and civil discord.

Here are two collective editions of the works of Buchanan. One is by Rudmam, published at Edinburgh in 1715 in two vols. folio. The other is by Peter Burman, Lug. Bat. 1725, in two vols. 4to. In this the editor has, besides his own critical annotations, incorporated the notes, dissertationes, and other helps of other editors. AGHANAN, REV. CLAUDIUS, D.D., vice-provost of the college of Fort William, in Bengal, and well known for his exertions in promoting an ecclesiastical establishment in India, and for his active support of missionary and philanthropic labours, was born on the 12th of March, 1766, at the village of Easing, a large village near Glasgow. When a young man of the age of twenty-one, he made his way to London almost friendless and unprotected, where he succeeded in attracting the attention of the REV. Mr. Newton, the well-known rector of St. Mary's Woolnoth. By Mr. Newton's influence, he was sent to Cambridge, where he was educated at the expense of Henry Thornton, Esq., whom he afterwards repaid.

He went to India in 1796 as one of the East India Company's chaplains; and on the institution of the college of Fort William in Bengal, in 1800, was made professor of the Greek, Latin, and English classics, and vice-provost. His residence in India was distinguished by the publication of his 'Christian Researches in Asia,' a book which attracted universal attention at the time it was written and has gone through a number of editions. In the years 1804 and 1805 he gave various sums of money to the universities of England and Scotland, to be awarded as prizes for essays on the diffusion of Christianity in India. One of the propositions which he designedly called "The Restoration of Learning in the East," by Mr. Charles Grant, now Lord Gleeneg, at present (1836) Secretary of State for the Colonies.

He returned to England in 1808, and during the remainder of his life continued, through the medium of the pulpit and the press, to enforce his views. His reply to the statements of Charles Buller, Esq., M.P., on the worship of the idol Juggernaut, which was addressed to the East India Company, was laid on the table of the House of Commons in 1813, and printed. He died at Broxbourne, Herts., on February 9, 1815, being, at the period of his death, engaged in superintending an edition of the Scriptures for the use of the Syrian Christians who inhabit the coast of Malabar.

[Life and Writings of Hugh Pearson.]

BUCHA'RIA. [Bokhara.]

BUCHA'RIA, LITTLE, or Eastern Toorkistan, was a name lately in use and employed to indicate the most western portion of the countries dependent on the Chinese empire. It now begins to be known under the Chinese name of Turfan, or rather Thian-Shan-Nath. Latter article a description of it is given.

BUCHOREST, but more correctly BUKARES'TH, the city of enjoyment, in the eastern part of Wallachia, is pleasantly situated in a rich and spacious plain, diversified by hills, and on the E. bank of the Dumbovita. In extent it is about 4 m. from N. to S., and nearly 3 m. from E. to W. It is the residence of the prince and divan or council of Wallachia, the seat of government, as well as of a Greek archbishop, and the head-quarters of the foreign envoys and consuls. Independently of its agreeable situation, Bucharest has no claim to its designation; for it is, with few exceptions, nothing better than a heap of wretched brick or mud cabins, ranged along streets either unpaved or unlighted, and without any regular plan or method of building. The streets are narrow and dark, and the houses packed so close together as to leave no space for windows. It is a place of few buildings of note, a large ruined palace, a vast old pile, now used in consequence of the destruction of the modern palace by fire in 1812, and of 67 quarters; these quarters being the separate property of the Boyars, on whose land colonies of their followers have gradually accreted to them, and of which the present appearance rather than of an immense village than of a regular town. The Boyars' residences are spacious, and built of stone. The handsomest building, next to the prince's palace, is the adjacent metropolitan church; both of them situated on the largest square, and in the centre of the town. There are sixty churches, built in an uncoexact style, none of which have fewer than three steeples or towers, and many no less than six; some have even nine. Seven of them, as well as the twenty monasteries and convents, are protected by walls. The other edifices are generally of the Greek and Catholic and a Lutheran church, a synagogue, several hospitals and infirmaries, and the consular residences, particularly that of the Austrian consul, which is a handsome brick structure, and the seat of several other consuls. It is said that during the reign of Sultan Selim, there was a tower, called the 'Fire Tower,' 60 ft. high, which commands a full view of every part of it. The lyceum for Greek youth is conducted by twelve professors, and the example set by the German residents has occasioned the establishment of a school in which twenty-four students are of Saxon extraction, and consist almost wholly of operatives, particularly goldsmiths and watchmakers. The pop., though once composed of 60,000 souls, which the calamities of war and political commotions have now reduced to less than 50,000, is on the increasing; the number of dwellings is about 10,000. The town is full of coffee-houses, almost every one of them having a gambling or billiard-table, and of shops where sherbet and wine are drunk. Bucharest is the great commercial mart for the principality, and as this is an extremely fertile country, the
inhabitants carry on an extensive trade in grain, wool, hosiery, was-supplied, and coal. It possesses nine or ten distinct hovens, of which that of Sherban-Wode is the largest and most frequented. There are no large manufactures; but small quantities of woollen cloths, carpets, brandy, &c. are made. The people are fond of outdoor display, and of public festivals, such as their dances, and their dancing is so frequent and habits present a singular mixture of European and Eastern customs. There is a Corso, or public mall, to which the fashionable resort in great numbers, in the main street and along the bridge which crosses the Dumbovitsa. Bucharest has a public library, a society for belles lettres, and another for agriculture; it has indeed made considerable advances in civilization during the last ten or twenty years.

44° 28' N. lat., 26° 8' E. long.

Buckingham, a par., and bor., and the t. of Buckingham, is situated on the Ouse, in the hund. of Buckingham, 50 m. direct distance N.W. from London. The municipal, which was formerly co-extensive with the parliamentary bor., is co-extensive with the par., which contains about 5000 acres, and is divided into the month of March. The churchwardens and overseers of the poor, but only one church and church-rate for the whole parish. The parliamentary bor., which was enlarged under the Reform Act, returns two members to parliament. Three of the districts into which the par. is divided are Buckland, Chiltern, and the other is divided into the month of March. In 1831 the pop. of the par. was 1672 males and 1936 females; of these there were—males 20 years of age, 883; occupiers and labourers employed in agriculture, 223; employed in manufacturing, or in making machinery, 125; employed in engineering, or in making engines, 200; capitalist bankers, &c., 17; labourers not agricultural, 138; male servants, &c., 117; female servants, 139.

Buckingham is an antient bor., and is described such as at the time of the Domesday survey, in which it is said to lie in the province of the foreignt king. But it does not appear that the town sent members to parliament before 1544. From the circumstance of Edward III. having fixed one of the staples for wool at Buckingham, it is supposed that the borough was ancient in his reign, though nothing is certain. The charter of the town was granted by the bishop of London, to the people of the town, and the charter of the town was granted to the people of the borough. The charter of the town was granted to the people of the borough. The corporation upon this charter for several years, but in consequence of a dispute with James II. in 1688, during which the king successively removed three mayors elected by them in three months, and the corporation was sometimes suspended, the charter of Charles II. was also surrendered. The corporation afterwards availed themselves of the proclamation for restoring surrendered charters, to resume the charter of Mary. Under the Municipal Reform Act, Buckingham has one member for the town, and, as a town of considerable size, with an ancient and flourishing history, the corporation continues to hold a considerable position in the county.

In June, 1644, Buckingham was for a few days the head-quarters of Charles I.; the neighbouring towns of Aylesbury and Newport Pagnell being garrisoned for the parliament. A fire broke out on the 18th of March, 1723, which consumed 138 dwelling-houses, being more than one-third of the whole town. No trade or manufacture is carried on in the town, except lace-making with bobbins. The only public buildings are the church, the town-hall, and the gaol. The present church stands on the site of the castle, under an act of parliament, by which the inhabitants were to raise 4000l. in three years, and Earl Temple the rest: the entire expense was about 7000l. It was completed in 1760. The living is a vicarage in the diocese of Lincoln, the gross annual income of which is 240l. The old church, however, is a lofty spire, which fell down in 1699; the tower which supported it remained till 1776, when it fell down also, just after Mr. Pennant, the well-known antiquarian tourist, had quitted the church. The entire structure was taken down, and the new church was built on a new plan.

It is probable that the assizes had been generally held at Buckingham before their removal to Aylesbury. In 1578 Lord Cobham procured an act of parliament to fix the sum—
which he laboured. One of these, which perhaps may be considered more doubtful (for what better might be his faulc Buckingham never evinced deficiency in personal courage), related to his marriage, in 1620, with the only daughter of the earl of Rutland. It was not likely that he should make dishonourable advances to the richest heiress in the king- dom, and yet there is no foundation for it but by the menaces of her injured father. Such however was the scandal of the time. Three years afterwards, while negotiations were pending for the marriage of Charles Prince of Wales with the Infanta of Spain, Buckingham inspired the prince with a belief that he would efficaciously secure the love of his future consort, and terminate many difficulties which the slowness of diplomacy interposed, if he would privately repair to the court of Madrid and woo his mistress in person. The secret motive which prompted him was jealousy of the influence which the cardinal had with the queen, who despaired of the treaty; and the king was induced reluctantly to consent to a project which he disapproved, and the suggestion of which it is believed he never forgave in his heart.

Many of the adventures of this expedition were of the most romantic cast. The prince, in company with the mar- quess, set out on the 15th of February, 1623, from New Hall in Essex, 'with disguised beards, and with borrowed names of Thomas and John Smith.' On ferrying over the river near Gravesend, they found themselves without silver; and to escape the diligence to which they were subjected, by which they presented the boatman, created so much sus- picion, that he, feeling a misgiving as to their quality, and thinking them gentlemen going beyond sea to settle some quarrel, laid information with the officers of the town, who set out in pursuit. For three hours they were thus pursued through that city however before the intelligence arrived; but on the brow of the hill beyond it they encountered the French ambassador, well attended, and in one of the royal carriages. This difficulty they escaped by quitting the high road, and entering a side path. This road, which is the nearest to the majesty's fleet, was then in preparation on the narrow seas. On the way afterwards, the baggage post-boy, who had been at court, 'got a glimmering how they were, but his mouth was easily shut'; so that 'through bad horses and other pretty impediments,' they did not reach Dover till six at night.

At Paris, having escaped some similar accidents on their route, they spent a whole day, and had a close sight of the Princess Henrietta Maria, 'at the practice of a masque dancing in person.' It is said, by Clarendon, and other more reliable personal adventures, but we must not omit a noble answer made by Buckingham to the Comte d'Oli- varez, who told him of a report that the prince was secretly designing his departure from Madrid. To this Buckingham replied, in August, 1623, that 'he was not a prince of his own country, yet fear would never cause him to leave Spain in other manner than should become a prince of his noble and generous virtues.'

Buckingham returned to increased popularity, and was made 'saviour of the prince.' He had been created a duke during his absence; and upon his landing he was nominated Lord Warden of the Cinque Ports, and Steward of the Manor of Hampton Court.

The war with Spain which ensued, the marriage with Henrietta Maria, and other more incredible personal adventures, but we must not omit a noble answer made by Buckingham to the Comte d'Olivarez, who told him of a report that the prince was secretly designing his departure from Madrid. To this Buckingham replied, in August, 1623, that 'he was not a prince of his own country, yet fear would never cause him to leave Spain in other manner than should become a prince of his noble and generous virtues.'
admitted that he was the perpetrator. Having been rescued in the first instance from the fury of the bystanders, who would have put him to instant death, he was recognised as John Felton, a younger brother, of mean fortune, and of Suffolk extraction. He is represented to have been by nature silent, glum, and melancholy, and was speedily driven from the army in consequence of disapprobation in promotion, and to have afterwards fed his irritation against Buckingham on this account, by listening to the many invectives which had been projected against him. He might not be without a touch of insanity; and it was whispered that his conduct was awakened to the full enormity of his crime before his execution. The news of the duke’s murder was announced by Sir John Hipsley to the king shortly after its occurrence, while he was on foot in his chamber. Charles was moved with horror at his declarations, unmoved, as it would appear, by the sad intelligence which had been whispered to him, and without the least change of countenance till prayers were ended, when he suddenly departed to his chamber and threw himself on his bed, crying out, ‘a Highland churl, which must abundantly dishonour the tears, the loss of an excellent servant, and the horrid manner in which he was deprived of him, and he continued in this melancholy discomposure of mind many days.’

George Villiers was murdered in his 36th year, having had three sons and one daughter by his wife Lady Catherine Mans. The Lady Mary was his first born; his eldest son died at nurse; his second succeeded him in his title and estates, and his third was Lord Francis.

An instance of Buckingham’s public-spirited munificence was recorded in his day, according to a tradition that he ordered his private character to be carefully noted, especially as his faults have been carefully chronicled. Hearing that a rare collection of Arabic manuscripts, which had been made by Erpenius, a scholar of great erudition, was at that moment on sale by his widow to a bookseller in London, ‘a lady of quality,’ says Sir Henry Wotton adds, ‘of such ware,’ the duke anticipated them by giving the widow five hundred pounds, ‘a sum above their weight in silver, and a mixed set of both bounty and virtue; but the heaviest load of being out of his natural element;’ for Buckingham, as it appears, received but an imperfect education. It was his intention, if the design had not been prevented by his unexpected death, to present these MSS., together with many other similar publications, to the University of Cambridge, of which learned body he was chancellor; after his assassination they were deposited by his widowed Duchess in the public library of that university, where they still remain.

BUC 512

BUC

Buckingham, George Villiers, Duke of, second son of the first Duke, and husband of his wife, Lady Catherine Mans, was born in London, January 30th, 1627. He was educated at Cambridge, under the especial patronage of the king, and after travelling with his brother, Lord Francis Villiers, he returned to England on the outbreak of the civil war, and distinguished himself in the field. The king, for whom he served, was defeated by Fairfax, near Nonsuch, in which battle Lord Francis, after fighting bravely, was killed, and the duke himself escaped with difficulty beyond the sea. The parliament required him to return within forty days, under a penal oath; but he preferred remaining abroad, where he supported himself by the sale at Antwerp of a valuable gallery of paintings which his father had collected. He afterwards served under Charles II. at Worcester, and was again compelled to take shelter in the Continent.

Part of his estates had been assigned by the parliament to Fairfax, who generously allowed the duchess of Buckingham, the duke’s mother, a considerable annuity. The duchess did not object, but that the republican government might exercise similar liberality towards the king, who was outlawed, to return to England, was well received by Fairfax, and married one of his daughters in 1657. Cromwell, taking this alliance ill, arrested Buckingham, and commanded him to give up his arms. On the 7th of August Cromwell he was released from Windsor Castle, the place which had been allotted for his less rigid confinement; and on the Restoration he recovered his paternal estates. He had already received the order of the garter while in Holland, and he was now sworn of the privy council, and nominated lord lieutenant of the county of York. His political conduct however was most versatile, and the influence which he maintained over Charles by his talent for agreeable ridicule was most unworthily employed in procuring the fall of Shaftesbury. His hatred of Buckingham was utterly profligate; and he appears to have regarded buffoonery as an honourable and legitimate weapon against a court rival. Not unfrequently, when the grave chancellor had retired from the council-table, Buckingham threw the king into convulsions of laughter by making the clerk of the great seal dangling by his side the bag and seals, and ordering an attendant to precede him with the bellows as a mace.

On the formation of the Cabal ministry Buckingham’s name contributed an initial to that anagram. In 1667 it proceeded on an embassy to the court of France, nominally to conciliate with Louis XIV. upon the death of Charles’s sister, the duchess of Orleans, but in truth to urge his accession to the triple alliance. On that occasion, he condescended to pen a letter to the king; he never scrupled to introduce him to the royal notice, and the actresses, Mistress Davies and Nell Gwyn, were first known at court through him. ‘He was a man indeed, to use the strong language of a contemporary by whom he was well known, who had studied the whole body of vice,’ and assured the king that one had ever had less barrier of principle to stand in the way of his instruction. So entirely did he set at nought all moral feeling, that when Charles II. on one occasion expressed apprehensions that his injured queen might probably intercede with the queen of Hungary herself, to have him removed to a West Indian plantation, where she ‘should be well taken care of, without creating more trouble,’ the king, though selfish and cold-hearted, had a kind of careless quality, sometimes standing in the place of good-nature, which was acceptable to him. ‘I hope, madam,’ is the answer of the favourite.

Already, in 1666, Buckingham had manifested symptoms of his wickedness, and had forfeited all his high offices, to which however he was subsequently restored through his own submission and the king’s extreme clement. The duke of Ormonde, on one occasion, and so deeply did Buckingham cherish resentment that there is strong reason to believe he was concerned in a plot which nearly ended in the murder of that noblemam by Col. Blood. The transaction was not inquired into, but the earl of Ormonde, eldest son of the duke of Ormond, could not forestall from taxing Buckingham with his guilt, even in the palace itself. Being at court, and seeing the favourite standing by the king, he addressed him to this purpose: ‘I have studied the whole body of vice;’ and assured the king that this late attempt upon my father, but I give you warning, if by any means he comes to a violent end, I shall not be at a loss to know the author. I shall consider you as the assassin, I shall treat you as such, and whenever I meet you I shall make you understand the consequences of your conduct; and I tell it you in his Majesty’s presence that you may be sure I shall not fail of performance.’ (Carte, Life of the Duke of Ormond, i. p. 223.)

Notwithstanding his public and private crimes, Buckingham still retained the king’s favour, was ennobled and entrusted with important embassies, and like his father was elected chancellor of the University of Cambridge. On the dissolution of the Cabal ministry and his dismissal from office, he gradually weakened himself from the court. In 1674 he resigned his office of Chancellor, returned home, was reported the Nonconformists by his opposition to the Test Act. He was deeply engaged in the popish plot, and the remainder of his days was spent in factious opposition, and in connexion with the intrigues of Shaftesbury.

Notwithstanding these anti-royalist actions, which were well known to Buckingham, but too plainly exhibits the demonralization of the times on which he was thrown. Buckingham, having been detected by the earl of Shrewsbury in an intrigue with his wife, killed him in a duel. The guilty wife who concert the meeting, disguised herself, held the duels, and at the close of this encounter, and at its close rendered herself more infamous by undaunted joy and shameless avowal of her passion for the paramour, yet reeking with her husband’s blood. For this murder, which occurred on the 14th of May, 1678, he received a royal pardon, but it was afterwards brought before the House of Lords in a petition presented by the earl of Westmoreland in the name of the young earl of Shrewsbury, who desired justice against Buckingham for his father’s blood and his mother’s infamy. The duke replied,
infinite pleasure, notwithstanding the obscurity in which it is involved from the want of that minute illustration by which in modern times it would have been so copiously elucidated.

The life of the duke of Buckingham was printed and his works were pirated by the notorious Curf in 1721, on which occasion a vote passed the House of Lords, declaring it to be a breach of privilege to print any account of the life or any of the works of a deceased peer without consent of his heirs or executors.

John Sheffield was born in 1649, and succeeded his father Edmund earl of Mulgrave in that title in 1658. When he was but 17 years old he served in the same ship in which Prince Rupert and the Duke of Albermarle had embarked in the first Dutch war. At the end of the following year he was summoned by writ to take his seat, but was excluded on account of nonage on a motion of the earl of Northumberland. In an encounter with the younger son of the earl of Chester, which occurred about this time, he conducted himself, according to his own biography, with distinguished credit. Some of the particulars are worth recording as a sample of the manners of the times. The earl of Mulgrave found that the words upon the report of which he had challenged Rochester were never indeed spoken, but still, foolishly thinking himself compelled to go on with the quarrel, he agreed, at his antagonist's choice, to fight on horseback, a way in England a little unusual. In order to avoid suspicion, on the night before the appointment he rode from his house at Knightbridge, where they found themselves in greater danger of recognition than if they had remained in London, 'because we had all the appearance of highwaymen that had a mind to lie skulking in an old inn for one night; but this, I suppose, they thought no notice of us, but liked us the better.' Lord Rochester appeared at the appointed place, bringing with him as his second an 'errant life-guardian whom nobody knew.' Besides this, the parties were so unequally mounted, that as the end approached, Rochester remained on his horse on foot. On their way to the ground however Lord Rochester 'observed that it was on account of sickness that he had at first chosen to fight on horseback, and that he now found himself unfit to fight at all any way, much less a foot.' They separated, he being informed 'entirely to the ruin of Lord Rochester's reputation for courage.' Dr. Johnson, in his life of Sheffield, without entering into any of these details, mentions that that nobleman has related this story perhaps too ostentatiously, as he tells how he once told Lord Chester that he would 'take him with sharp reproaches.' It appears to us, on the contrary, that his narrative is very plain, and does not exhibit any symptom of boasting.

Dr. Johnson, from unreasonable vaunting of personal courage, that in his case meant an engagement with De Ruyter in the second Dutch war, in which he served with great gallantry as a volunteer on board the ship of the earl of Ossory, he tells us that 'in the morning, when the enemy's great shot came on both sides of us, I thundered so loud, and spoke so loudly, that I was in great hazard of being shot, and too much for this reason; I thought it impossible to escape without losing a limb at least, and was in a very pretty uneasiness; but about the afternoon, when the broadsides came only one way, though without interruption, I began to grow a little less sensible of the danger, which yet I was very glad to see ended at night.' These are not the words of a braggart, and his behaviour in the engagement was so distinguished as to procure for him the command of the best second-rate ship in the navy.

In the land service he raised a regiment of foot, and commanded it at Westminster, but it was not a part of the regiment in which he bore the like commission, was also placed under his orders. He was installed Knight of the Garter, and appointed a gentleman of the bedchamber. For a short time he entered the French service under Turenne, and when the ill-fated Viscount Ramillies was taken prisoner, which was a sad day to the country, Sheffield received the lord-lieutentancy of Yorkshire with the government of Hull, from which the duke was dispossessed; or as Dryden tells us, he became one of the mighty.

On the accession of James II., he was sworn into the privy council and appointed Lord Chamberlain. Not being very fervent in his religious opinions, and indeed holding a place in the high commission, with the illegality of which he afterwards professed himself to be unacquainted, he took
no part in the revolution. Once it was designed to request him to join in the invitation to the prince of Orange, but the Duke of Buckingham declared his announced election, and his Marquess of Way ford's concurrence was not to be expected. His reply to King William, who mentioned this fact to him, was singularly bold and upright. 'Sir,' said he, 'if the proposal had been made, I would have discovered it to the king within an hour, but the hand of the prince is nullified, and if anything be added, that he was far from being displeased with this answer. Marlgrave however by no means courted the favour of the reigning king. He opposed him on some important questions, and it is pleasant to relate that this opposition did not interfere with his advancement, nor did his advancement silence his opposition. In 1694 he was created marquess of Normandy, and afterwards was admitted into the cabinet council with a pension of 3000l. per annum.

On the accession of Queen Anne he was named Lord Privy Seal. It is said that an early tender attachment to that princess once nearly cost him his life; for that Charles II., in order to punish his ambition, despatched him in a leaky vessel to the relief of Tangier. In 1705 he was created duke of Buckingham and Normanby, which title was being suspected to be, somewhere, a latent claim to the title of Buckingham.' The claim to which Johnson alludes in this passage we have not been able to trace.

In consequence of the ascendency of the duke of Marlborough in the Prince's cabinet, of the Queen's dislike to the queen of Dunkestre, and of the Duke of Marlborough's opposition to the principle of the Tory motion for inviting the Princess Sophia to England. He refused the strong temptation of the chancellorship, which was offered to lure him back, and employed his leisure from politics in erecting Buckingham Palace which William Cavendish, 4th Duke of Devonshire, had begun. Some vignettes of that house, which since it has ceased to exist may have become valuable, are found at the heads of some chapters and in illuminated capitals in the 2nd volume of his collected works. Of his mansion and of his family, and of the history of the present occupant at the well-written description in a letter to the Duke of Shrewsbury. In 1710 he was made Lord Chamberlain of the household, but after Queen Anne's death he reverted to opposition. He died February 16, 1722, his first son, the present occupant in Westminster, by his third daughter, a daughter of James II. by the countess of Dorchester, and widow of the earl of Anglesey, besides other children he had a son Edmond, by whose death in 1735 the line of Sheffield became extinct. To that house, however, of his family he has been tenderly attached, and the construction of Buckingham Palace he paid especial attention to her convenience. 'The highest story of the private apartments (as he tells us in the letter above alluded to) is fitted for the women and children, with the floors so contrived as to avoid any noise over my wife's head during the mysteries of Lucina.'

As a poet the duke of Buckinghamshire is below criticism, and it is to his rank rather than to his talent that we must ascribe the praises which he received from Roscommon, from the Archbishop of Canterbury, and from Lord Chief Justice Burlington, and from Pope. Dryden perhaps received his ten guineas for the eulogy in the dedication to 'Aureng-zobe,' in which it is remarkable that he extols rather the political than the literary merits of his patron; but the character given in 'Abelam and Achitophel,' which is more to our purpose, was probably altogether gratuitous.

"Sharp-judging Adriel, the Muse's friend, Himself a Muse."

Addison and Boswell have respectively commended the "Essay on Poetry," and as Pope has preserved the memory of the best verse in it, 'Nature's chief masterpiece is writing well,' by incorporating it in his own 'Essay on Criticism.' The few prose pieces which the duke of Buckingham has left to us are not captivating; and although now perhaps forgotten, they deserve a much higher rank than his poetry. His remains lie under a sumptuous monument erected by his widow in Westminster Abbey. Moreiri, in his article 'Buckingham,' confounds John Sheffield with the second George Villiers, and makes a strange medley of the two, ascribing the 'Rehearsal' to the former.

George Grenville Nugent Temple, second earl of Temple, was created marquess of the town of Buckingham in 1784, and his son, Richard Grenville Brydges Chando, was advanced to the dukedom of Buckingham and Chandos in 1822.

Buckinghamshire, an inland co. of England, of very irregular form. Camden derives its name, though his etymology has been disputed, from the abundance of beech trees. It is one of the largest counties in England; it is 130 miles long. It is bounded on the N. and N.W. by Northamptonshire; on the W. by Oxfordshire; on the S. by Berkshire; and on the E. by Middlesex and Hertfordshire. The greatest length measured nearly N. and S. from the neighbour of Olney to the river Thames above Staines is 53 miles. Its breadth varies much, the greatest being about 37 miles.

Aylesbury (which, though it does not give name to the co., has, on the whole, the best title to be considered the county town) is about 37 m. in a direct line N.W. by W. of London; or by the road through Berkhamstead and Tring 38½ m.; or 40½ m. by Uxbridge, Amersham, and Wendover.

The area of the co. is 738 sq. m. (473,320 acres); or taking the sum of the returns for the different parishes, 463,820 acres; it is one of the smaller English counties, being the thirty-third in the scale of relative magnitude.

Surface, Hydrography, and Communications. — The principal hills in Bucks are the Chilterns, a chalk range, which entering the co. from Oxfordshire runs across it in a N.E. direction and enter Bedfordshire near Dunstable; separating it from Beds and Herts. near Flitwick and Henley. Under the tribute of the Theame, and from the basin of the Ouse. Near Ivinghoe the elevation of these hills is 904 ft. above the level of the sea; and another eminence S.W. of Wellingborough is 905 ft. above the sea. Muzzle Hill near Brill is 744 ft., and Box End a little S.W. of Leighton Buzzard 549ft. Under the northern slope of these hills is the rich vale of Aylesbury, watered by the Thame. In that part of the co. S.E. of the Chilterns there is a good deal of woodland, though it has much diminished within the last 100 years. The prevailing timber is oak and ash, S. C. elm and poplar. There is some wood on Whaddon chase, a tract of high land in the northern part of the county. The whole of the Chiltern district is said to have been a forest; and according to tradition is still covered with woods. The part of the co. which is not covered with woods, chiefly of beech, is to be almost impassable, till an abbot of St. Alban's had several of them cut down because they afforded harbour to thieves. The name Chiltern is derived from Camden from 'Cold Ench' and 'Chert'; or Chert, signifying chalk. The chief riv. of Bucks is the Thame, which skirts the co. on the S.W., separating it from Berkshire, and, for a short distance, from Surrey; the Coln, which separates Berks from Middlesex until its junction with the Thames at Staines; the church which is a feeder of the Thames; the Ouse, and its tributary the Ouse.

The Thames becomes the boundary of the co. a little below Henley, and has a winding course first to the E. and then to the S. W. at Streatley and Maidenhead, and Eton, to its junction with the Coln, being navigable throughout this part of its course. Its waters do not receive any material accession from Bucks: the Wix, which passes High Wycombe, joins it below Marlow; one or two small streams alluded to near Eton, and another a little lower down opposite Old Windsor.

The Coln becomes the boundary of the co. a few miles below Rickmansworth, and continues, by one or other of its arms, to be the boundary until it meets the Thames. In the general course of its great meander it passes through Colnbrook, and receives a considerable stream, the Mushbourn, from Amersham. It is not navigable. It produces trout and other fish.

The Thames is formed by the junction of several small streams; the principal, to which the name of Thames is assigned, rises near the vil. of Stewley, between Fenny Stratford and Aylesbury; and flowing in a winding channel, but on the whole in a S.W. direction, unites near the vil. of Quainton (W. of Aylesbury) with another stream which rises near Tring (Herts), and is partly through Hertfordshire and partly through Bucks, and for a part of its course forms the boundary of the two counties. These streams before their junction are swelled by a few insignificant streams below their unites to a stream until it reaches the border of Oxfordshire, near the town of Thame. From the junction of the two streams to this
point it receives some rivulets which water the vale of Aylesbury. Near Thame, according to some of our authorities, the navigation commences. After separating Bucks from Oxon for a few miles, the riv. enters Oxfordshire, through which it flows till it joins the Thames; for Donnington, the whole length of the Thames in that part of its course which belongs to Bucks is about 28 miles. Its further course till its junction with the Thames is about 14 miles, making its whole course 42 miles. This riv. abounds with fish, especially with eels (long and thin), and produces pike, perch, chub, roach, and gudgeon.

The length of the Ouse, and the extent of surface which it drains, give it a high place among the English rivers; but it is only in the upper part of its course that it is of importance. In the County of Hants, it enters the co. at Turweston near Brackley (Northamptonshire, in which co. the Ouse rises), and after dividing it for a few miles, first from Northamptonshire and then from Oxfordshire, quits the border, and flowing E. and then N.E. through the co. past the town of Bicester near the Oxford comes a border stream, and separates Northampton from Bucks. Again quitting the border it crosses another part of the co., flowing in a very winding channel to the N.E., past Newport Pagnell (where it receives the Ousel), Weston Underwood, and Olney. After dividing Bucks from Bedfordshire for a short distance, it finally quits the co. a few miles below Olney. Its whole course within the co. is 43 m.; the direct distance from the point where it first touches to the Thames to the point where it leaves the co. is 23 m.; increase of length by its sinuositys 20 miles.

The Ouse is formed by the junction of several small streams, which rise on the N. slope of the Chilterns or their continuation, the Dunstable Downs, and unite on the border of Beds and Herts. A branch of the E. Pot 'the Lower Lea.' by dividing for several miles the two counties it quits the border, and flows through Bucks N. to Newport Pagnell, where it falls into the Ouse. Its whole length may be estimated at 25 to 30 miles. It is remarkable for fine scenery and scenery.

Bucks is tolerably well furnished with canals. The Grand Junction enters this co. from Herts not far from Tvinghoe and runs N. to Newport Pagnell, following the valley of the Ouse, thence it follows the valley of the Ouse till it enters Northamptonshire and Bedfordshire. There are several cuts from this can. in Bucks; one to the town of Buckingham, and another to Wendover, and a third to Aylesbury, besides a shorter cut to Stony Stratford.

Several important roads cross this county. The parliamentary and mail road through Chester to Holyhead, the main channel of communication between the metropolis and Ireland, crosses the N. part in a N.W. direction, between High Wycombe and Marlow, which is followed by the road between Chester, nearly parallel to this, and more to the N., passes through Newport Pagnell. In the S. part of the co. there is the Oxford road through Beaconsfield and High Wycombe, and the great G. (Bath and Bristol) road between Cirencester and Maidenhead. There is also a road to Birmingharn through Aylesbury, Winslow, and Buckingham.

Geological Character.—The general direction of the outcrops of the different geological formations which cross this county is N.E. and S.W., and the formations present themselves successively to the observer as he travels N.W. The S.E. part of the county, included between the Thames and the Colin, is occupied by the plastic clay which skirts the London clay. Only a very small portion of the London clay occurs in this part of Oxfordshire, near Staines and South Staines. The chalk underlies the plastic clay, and rises from beneath it, forming the range of the Chiltern hills. From the summit of the N.W. escarpment of this range is an extensive view over the subjacent low country. The chalk marl, marly, and marly clay are also represented, and the marly limestone above the marl.

The chalk marl and the succeeding Tewtswood clay form the soil of the fertile vale of Aylesbury: the sandstone rises into a ridge bounding that vale on the N. and N.W.

The oolite series of formations succeeds those which we have already noticed, and occupies the N.W. part of the county. Of the Ham Sandstone, of which little is known, this series appears in Bucks. The Oxford or chalk clay rises from under the Oxford limestone, and extends to the town of Buckingham and to the N.W. of Stony Stratford and Newport Pagnell. To this formation succeeds that containing the cornbrash, forest marl, great oolite, and other strata.

Agriculture.—The climate of Buckinghamshire is mild and healthy, like that of most of the inland counties in which there are no fens or marshes to engender fowries and other nuisance. It is, however, subject to the climate of England through its whole breadth from S.W. to N.E., are neither very high nor bleak, and the general temperature is favourable to the ripening of most of the crops usually raised in Great Britain. The hills, which are a portion of the Chiltern range, with corresponding the borders of Berkshire and Bedfordshire, divide the county into two distinct parts, varying in soil and fertility. To the W. lies the fertile vale of Aylesbury, which contains some of the richest pasture in England, and is a par excellence of the great advantages which arise out of this rich tract are some inferior soils; and as you recede from it still farther N. some very poor wet clays and gravels, which require a great outlay to be well cultivated, and return little profit to the farmer. Where they are not under a good systematic culture, these clays, which are not well drained, afford little rent, and scarcely a bare existence to the lawman. They are no doubt capable of improvement, but with low prices for agricultural produce, there is no great inducement to lay out capital on the improvement of such land.

Towards Bedfordshire there are some light sands partaking of the nature of the sandy belt which crosses that county. On the S.E. of the county the surface is more varied, there being several depressions or valleys on the western slope, in which considerable tracts of land are sunk. The mixture of chalk with the clay forms a soil well suited to wheat and beans, which, with the help of moderate mowing and good tillage, produces abundant crops. Farther N. from the chalk hills are variours species of soil, some of the elevations consist of gravel intermixed with clay or loam, others are composed entirely of poor ferruginous sand, and are but partially cultivated, a portion being planted withcheese at various parts of the county. The principal way of disposing of poor sands, on which little will grow except chestnut. Descending towards the great plain in which the Thames flows, the soil improves greatly: a good loam lying on a gravelly subsoil offers a sound soil for the growth of most crops and is very productive. An old field that has had a tolerable improvement in the mode of cultivation, since many of the old common fields have been inclosed. In the plain which extends along the Thames and to the borders of Middlesex, are some very good and well-cultivated soils. From Marlow to Staines, and for a few miles from the Thames, the cultivation of the land is conducted on good principles, as may be observed all along the great Bath road as far as Maidenhead bridge. The lower lands along the Thames and Colne, which are occassionally flooded, are in permanent meadows and very valuable. The whole of this plain consists of a good loam lying on the blue clay, called the London clay; but with the interposition, in many places, of a stratum of gravel, which adds much to the soundness of the soil and a natural decumbrance. The arable land in this part of the county, although much inferior to that in the vale of Aylesbury, is more carefully cultivated, and the general average return from it is probably fully as great.

According to the estimate made in the Agricultural Report in 1905, the county of Buckingham contains about 339,000 acres of land. Later calculations and measurements of the survey made for the Board of Ordnance make the surface covered by these large and smaller fields and pastures, and the other under the plough. The proportion varies according to circumstances. A high price of corn is a temptation to break up grass lands, and low prices induce the farmer to lay down the arable to grass. It is almost certain that the yield of wheat per acre has been increasing in recent years, and especially that the lands laid down to grass have been previously exhausted by overcropping, and sown with grass.
seeds in a foul state, by which great loss has been sustained both by tenant and landlord. A great many commons and common fields have been inclosed of late years, and considerable improvements have consequently been made, but the progress has not been so rapid of late, owing to the low prices of agricultural produce. The present gross amount of produce in corn, cattle, and from the dairy, which this county sends to the metropolis and surrounding markets is however large, and will no doubt increase with the increase of capital and skill applied to the cultivation of the soil. A great advantage to Buckinghamshire, in an agricultural point of view, is the convenience of water carriage by the banks of the rivers which wind their way in various directions. The railroads projected and in progress will enable the farmers to send their produce to London at a still cheaper rate; but this accommodation will be still further extended by the proposed Birmingham and London canals which will intersect this county, and by which the canal distance between Manchester and London will be lessened 23 m, with 77 fewer locks: the estimate is three millions. There was formerly a very inconvenient division of the land in many places, under yard bounds; in the law book styled virgata terrae. This somewhat resembled the run rig and run dale in Scotland. [BERWICKSHIRE.] It consisted of various narrow and unconnected strips about a pole wide, which, taken together, amounted to 30 or 40 acres, and the names of the owners of the strips being attached. The occupiers were restricted to a certain mode of cultivation highly inconvenient, which was a great obstacle to improvement. Most, perhaps all, of these divisions have been done away with by acts of inclosure. Buckinghamshire being a good county, the farms are not in general very large; few are above 500 acres, and many do not exceed 20 or 30: the average may be taken at about 200 acres. The rent of arable land has fallen greatly of late years, and it might be difficult to state a general average. The poor-rates, till the introduction of the late new laws, were extremely various: and as in taking a farm the poor-rates and tithes are always taken into consideration, and the rent is proportionally less when the poor rates are high, they have materially affected the annual value of the land when let. In this manner of reckoning, the farmer pays from 25s. to 40s. per acre for good arable land, of which the landlord receives from 15s. to 30s. Meadows let proportionally higher, especially those which are situated along the rivers and can occasionally be flooded at the option of the occupier. Leases for 7 and 14 years prevail, but most farms are let from year to year; and the tenants are seldom removed, provided they pay their rents current and due in a third of a year. The ploughs and instruments of husbandry have been improved since the publication of the Agricultural Report. Although old-fashioned ploughs, drawn by four or even five horses in a line, are still occasionally seen on some of the steepest and most inaccessible hills, the general tendency is to better implement drawn by fewer horses. In very wet stony soils the treading of the horses on the land already ploughed is very hurtful; and in these lands it is best to let the horses follow one another in the furrow. Like the rest of England, Buckinghamshire once contained many common fields, laid out in narrow pieces, or lands, which did not admit of cross ploughing, and which were seldom or never straight. By being constantly ploughed together, these lands became at last so high and rounded, that if a man sat down in the furrow which divided them he could not be seen by another man in the next furrow, owing to the great height of the ridge between them. When these lands were inclosed and laid in regular fields, it took no little trouble to bring them to a regular form. This could only be done gradually; for the best soil being accumulated on the crown of the ridge, would, in levelling, have been buried in the furrows, leaving a barren subsoil exposed. It was not until the ridge was gradually lowered, and the deep furrow filled up, until the land could be ploughed across the old furrows without much difficulty; after which new and straight ridges could be formed. The occasional application of the spade greatly accelerated the improvement. A few of the old crooked ridges may still be seen on farms where the proprietors or the occupiers dread innovation. The object of high ridges may not be to retain all the water, but to let the water run off; but a much better method is to underdrain the land up each furrow, which will take off the superfluous water more effectually. Narrow furrows, properly laid out, will keep any soil sufficiently dry when the under-drains prevent accumulation of water in the furrows. The furrows, judiciously deepened with the spade across the ridges, will often take all the water when there are no under-drains. When the lands are laid in a good form they may be kept so by alternately changing the crown and furrow, or which is much the better, by a higher ridge cut across the valley of each furrow, parallel with the closely inclosed meadows, and the space between the ridges; these will each contain and drain as they are filled with water; the surface level of the furrow will be raised parallel with the adjoining lands. In the dairy districts are extensive pastures, which would be much improved by greater subdivision. Besides the advantage of ditches in draining a soil naturally retentive of moisture, and the shelter given to cattle and sheep by high banks and hedge-rows, it is ascertained that milk frequently shifted this better than when they kept a long time on the same pasture. In very large pastures there are always spots where the grass is sweetest, and eaten more closely, while in others it is left by the cattle to grow long and rank, and is consequently wasted and trodden down. At smaller pastures the same effect is produced. The cows are chiefly short-horns, Glamorgan, and home-bred. On some lands none succeed so well as those which have been reared at home; on others it is said that cows brought from a distance thrive better. May not this be accounted for by the difference of the soils in the two situations, and reared? Those who select a good stock to breed from, which experience has shown to suit the quality of the pasture, and keep the calves and heifers well till they come to the table, will probably reap the benefit. Although the farmers sell only their own stock at home, so that they may be accustomed to the pasture; and, although cows thus reared may be more expensive than cows that are purchased, they will well repay the difference by their greater produce, and general condition when sold on the market. Such small attention be paid to the selection both of the bulls and cows to breed from, the cheapest plan is to purchase cows of a good breed, with their first calf, bred upon land rather inferior in quality to that on which they are to be kept, so that they may not be prejudiced from the change to a more regular pasture. The large Hereford oxen are preferred for grazing where the land is very good, from the notion that a large ox is more profitable than a smaller. A large ox when fat has, for instance, the advantage of being two shillings per cwt. higher than a smaller, supposing both equally fat and well-shaped; but it is by no means proved that this flesh is produced by the same proportion of feed. A small ox will fatten on inferior pasture and in a much shorter time than a larger. The return is therefore quicker and more certain, and there are experienced men who maintain that such a small North Devon or a Scotch highland ox will give a better average profit on his cost and food, in a given time, than the larger Hereford. The small Scotch oxen, which fatten so readily in English pastures, will always bring a better price than on the Scotch market, and there is never any difficulty in disposing of them. Oxen are now much less frequently used in the plough than they were formerly in this county. The greater speed and general usefulness of the horses causes them to be preferred in spite of the pretended economy in the use of oxen. Hay is the chief food of the cattle in winter, but turnips and straw begin to be substituted, notwithstanding the bad taste which turnips impart to the butter. This taste may be dispelled by carrying some mixture of meal, or a part of warm water to the new milk, and putting a small piece of salt petre in the cream. No great quantity of cheese is made in this county, except at a few cream cheeses in the neighbourhood of the principal towns. The butter is chiefly sent to London made up in the form of oblong rolls weighing two pounds each. It is sent in baskets called from their shape, which hold from
20 to 40 rolls. Their depth is uniformly 11 inches. Each flat is marked with the initials of the dairyman who sends the butter, and the carrier who buys it, to whom also the flat belongs; and the quantity contained in each flat is also marked upon it. The factor in London pays the carriage, and remits the amount of the sale once in the month. Dairy farms the calves are usually sold, when three or four days old. The farmers to whom the calves are sold are those farmers who being within a moderate distance from London or any considerable town, find it more profitable to fatten calves by sucking them than to make butter. The calves fattened by farmers to make this business profitable should sell by weight at about half the price of butter. It often sells for much more.

Many ewes are kept in this county for the sake of early lambs for the London market. The Dorsetshire ewes, which have been very rare in the season, are consequently preferred for this purpose. Where mutton is the object, the South Down breed is in greater request. The Gloucestershire and Leicester and a breed crossed between them have lately come into favour, especially since long wool has borne a better price in proportion to the quantity than the shorter and finer. On the Chiltern hills they buy two-thirds of wethers and one-third of ewes in autumn; the wethers are fattened on turnips, and the ewes, after their lambs are fat and sold off, are themselves fattened on grass the next summer.

There is a breed in the county generally large and black; some of them are bred in the county, but most of them are brought when young by dealers from Northamptonshire and Lincolnshire. The largest and finest are usually brought from dealers in Northamptonshire. The dealers draw large profits at a considerable profit. The mode of feeding horses is good and economical. They are sold in the stable on green clover or tares in the summer; and in winter they have hay with straw and oats.

The favourite breed is the Berkshire, sometimes crossed with foreign breeds, as the Chinese or Neapolitan, or with the Sussex and Suffolk breeds. The Neapolitan cross increases the aptitude to fatten, but renders the hog more delicate and liable to disease. The Chinese cross very greatly small porkers and sucking pigs. The quantity of pigs now introduced from Ireland has much diminished the profit on breeding this species of stock in this county.

There is a peculiar trade in this county, which is the rearing and fattening of ducks, especially for the London epicures. The eggs are hatched under hens, and the ducklings are reared in the house with great care. Ducks six weeks old will in January fetch 12s. a couple. It is usual that ducks to the value of 4000l. are sent annually from Aylesbury alone, and 20,000l. from the whole country.

The value of labour varies in different parts of Buckinghamshire, being generally in the inverse ratio of the poor rates. In some of the northern and western parishes of the county, the wages are above the average wages. No beer or food is allowed except in harvest.

There are numerous fairs in Buckinghamshire, the principal of which are as follows:

Amersham, Whit Monday, Sept. 25; Aylesbury, Friday after Jan. 18; Saturday before Palm Sunday, May 8; June 14, Sept. 25, Oct. 12; Beaconsfield, Feb. 13, Holy Thurs.; Buckingham, Jan. 12, March 6, Whit Thursday, July 16, Sept. 4, Oct. 5, Nov. 8; Burnham, Feb. 22, May 1, Oct. 2; Chesham, April 21, July 22, Sept. 29; Cosgrove, May 5, May 3; Fenny Stratford, April 10, July 18, Oct. 11, Nov. 28; Ivinghoe, May 6, Oct. 17; Marlow, May 1, 2, 3, Oct. 29; Newport Pagnell, Feb. 22, April 22, June 22, Aug. 29, Oct. 22, Dec. 29; Olney, Easter Monday, June 29, Oct. 2; Rioborough, May 6; Stony Stratford, Aug. 2, Oct. 11, Nov. 12; Wadow, May 12, Oct. 2; Winslow, March 20, Holy Thursday, Aug. 21, Sept. 22; Woburn, May 4, Nov. 12; Wycombe, Monday before Sept. 29.

In the year 1826, when the Parliamentary Survey was made, this county was divided into eighteen hundred. They are now reduced to eight; one of them however still retaining the title of "The Three Hundreds of Aylesbury. We give the ancient and modern hundred in a tabular form, noting our situation in the county.

## Antient Hundreds.

- Bonehill (Dunstow), nearly coincident with Newport (N.)
- Ellesberie (Aylesbury), ditto
- Stones (Stone), ditto
- Raiborough (Rioborough), ditto
- Coslau (Cosgrove), ditto
- Muresla (Mossley)
- Eralai
- Essendon (Ashendon)
- Votechale (Waddesdon)
- Tichesdele
- Rustonburgh, ditto
- Stoches, ditto
- Burnham, ditto
- Desborough, Stoke, and Burnham, 'Chiltern Hundreds,' the stewardship of which is a well-known nominal office, bestowed upon a member of parliament who wishes to vacate his seat.

The number of parishes given by Camden is 183; Messrs. Lyons (Magna Brittan) compute them at 201, 'as nearly as can be ascertained,' including 8 which have parochial chapels dependent on other churches, and two churches which were pulled down by Cornelius Holland, one of King Charles's judges, and have never been rebuilt. The number of rectors and vicars, with the total of their tithes, is 202; Messrs. Lyons, viz. 201; but the chapels are not distinguished. Several chapels are indeed noticed in that return, but all as combined with or dependent upon one or other of the 201 parishes. Some of the parishes have a very small number of inhabitants, and the tithes of the 183 parishes are less than 40. Cressow has only 1 house and 5 in.; and Tattenhoe only 2 houses and 13 in. Portions of 5 parishes belonging to Oxon are included in this co.

The manor of Aylesbury, as being one of the assize towns, the place where the quarter sessions are always held, and the principal place of county election, has the best title to be considered as the county town. It is on a little stream which flows into the Thames. It was built by the Romans in the 1st century of our era, and in 1831, 3110. The other manors are Great Marlow (pop. 4237) on the Thames; High Wycombe and Chipping Wycombe (pop. of the bor. 3158, of the whole parish 6293) on a small stream flowing into the Thames; Newport Pagnell (pop. 3338), as the junction of the Ouse with the Ouse; Aylesbury (pop. 2816) on the road from London to Aylesbury, by Ouse; Beaconsfield (pop. 3338), including several parishes, on the road from London to Aylesbury, by Ouse; Chesham (pop. 1762) between Uxbridge and Wycombe; Stony Stratford (pop. 1619) on the Ouse; Winslow (pop. 1290) between Aylesbury and Buckingham; and Ivinghoe (pop. 578) between Dunstable and Wadow. [Amersham, Aylesbury, Beaconsfield, Buckingham, Marlow (Great), Newport Pagnell, Wycombe (High).] Of the less important of these places we shall subjoin a few particulars, as well as of Fenny Stratford and Colnbrook, which formerly had markets (now disused), and are consequently sometimes reckoned among the m. t. of, and a few other places, which have some claims to notice.

Chesham is a m. t., in the hund. of Burnham, to the right of the road from London to Aylesbury, 29 m. from London through AYLESBURY, or about 26 through Watford and Rickmansworth. It has a market on Wednesday, and three fairs, April 21st, July 22nd, and September 28th. The living is a vicarsage, in the gift of the duke of Bedford. The parish church, dedicated to St. Mary, is a large Gothic structure. There are four Dissenting meeting houses, most of the in. being Dissenters. There is an almshouse for four poor persons, endowed by Thomas Weldon, who died 1624; and a free school, or national school, for the education of the children of the poor.

The town is in a pleasant and fertile valley, watered by the Chess, a branch of the Coln; it consists of 3 streets. The pop. of the par. in 1831 was 5388; but from the vast extent of the par. (11,880 acres, 18 to 19 sq. m.), this furnishes little clue to the pop. of the town itself. The
chief trade of the place consists in making shoes for the London market; the females are employed in the manufacture of lace and straw plait. There are some paper-mills in the neighbourhood. Formerly considerable business was done in the manufacture of turnery and coarse wooden ware, but the branches of these trades have ceased to exist. Of the population, 504 were employed in manufacture, trade, or handicraft.

Olney or Oulney is a m. t. on the N. bank of the Ouse, in the hundred and deanery of Newport; it is to the right of the great road from London to Castle Hedingham. The town is known as the haunt of scribes; it has a market on Monday according to some of our authorities, or Thursday according to others; and three fairs, one on Easter Monday, one on June 29th, and one on October 21st. The living is a vicarage, in the patronage of the Earl of Burlington, in the diocese of Canterbury. The town consists of one long street; the houses are built of stone, and the older of them for the most part covered with thatch; but in consequence of a fire in 1786, in which 43 dwelling-houses, besides other buildings, were consumed, those of later erection are chiefly covered with tiles. The church, dedicated to St. Peter and St. Paul, is a spacious building, ornamented with a tower and a lofty stone spire, 185 ft. in height from the ground. There are meeting-houses for Quakers, Baptists, Independents, and Methodists. There are some almshouses, and there are in the church four arches, besides several small arches extending over the meadows, which in winter are frequently flooded. To this bridge it is likely Cowper refers in the well-known lines,—

"Hark! 'tis the twanging horn o'er yonder bridge,
That, with its닐 nail, must befall itself,
Hides the winter's flood."

The pop. of the par., in 1831, was 2344, and 74 in the hamlet of Warrington; of the 2344, 201 were employed in retail trade or handicrafts. Lace-making was for a long time one of the chief occupations of the town, silk weaving and the manufacturing of hosiery have been introduced. Olney was the residence of the poet Cowper. Moses Browne, author of "Piscatory Eleguages," was vicar of Olney; and the Rev. John Newton, an esteemed religious writer and preacher, was curate here during the residence of Cowper.

Prince's Risborough is a small town in the hundred of Aylesbury, about 37 m. W.N.W. of London, on a by-road from High Wycombe to Thame. It has a market, formerly held on Saturday, but now on Thursday, but very little business is done; also a fair on the 6th of May. The town is supposed to have received its name from Edward the Black Prince, who had, according to the tradition of the inns, a residence here. A stone bridge erected in 1520, in a street joining the churchyard, is thought to surround the site of this house. The living is a vicarage, in the gift of the crown, held also of the annual value of £250; there are two Dissenting meeting-houses, an endowed school, and a national school.

The celebrated John Hampden represented Wendover in five Parliaments. Stony Stratford is on the Ouse, in the hundred of Newport, 53 m. from London, on the parliamentary and mail-road to Holyhead; it is built also on the ancient Watling Street, along which it extends about a mile. The houses are built of stone, and in Caversham, in the neighbourhood. There is a church, that of St. Giles, on the S.W. side of the town, rebuilt in 1776; it exhibits a bad imitation of Gothic architecture. (Lyon's "Mag. Brit."). On the N.E. side of the town is the tower of the former church of St. Mary Madgalen; the body of the church was destroyed in 1742, in a fire which laid a considerable part of the town in ashes. The streets are partially paved, and not lighted. There is a stone bridge over the Ouse at the farther (i.e., N.W.) end of the town. One of the crosses erected by Edward 1. is at the places where the corpse of his queen Eleanor of Castile rested on its way to interment in Westminster Abbey, stood in this town, but it was demolished in the great civil war. There was in remote times an hospital of St. John. There are Independent, Baptist, and Wesleyan meeting-houses in the town, or very near it. You enter the national school and two large Sunday schools, in which the children of the poor are taught the rudiments of education.

It has been supposed by Camden and others that the Lactorodrom from the Celtic lech, a stone, and ri and ryd, a ford to that of Stratford. In the map of Antient Britain, published by the Commissioners, Stradford is marked. Lactorodrom is fixed at Tewctor. It was in this town that Richard III. possessed himself of the person of the unhappy Edward V. and arrested Sir Thomas Vaughan and the Lord Richard Grey.

The market is on Friday, and there are three fairs, viz. on August 2nd, October 11th, and November 12th. There was till of late years a fourth fair, held in April, but this has been discontinued. The only manufacture is that of lace. Carlisle (Top. Dict. of Eng.) fixes the October fair on the third Thursday. There is a stone bridge over the Ouse. Winslow is in Cotsal hund., on the road from Aylesbury to Buckingham, 49 m. by the road through Tring, and 51 through Amersham. It is a neat town on the brow of a hill, commanding several fine prospects. It consists chiefly of three streets, composed of brick-built houses. The church, dedicated to St. Lawrence, is a large pile of building, with a square embattled tower at the W. end. The living is a vicarage, in the gift of the crown. The market is very small, and is held on Thursday. Before Easter, the year, March 20th, Holy Thursday, August 21st, September 22nd, and the Thursday before October 11th. The town is in the hundred of Cotsal hund., and has several white-painters. There is a market for vegetables, in the neighbourhood for making opium. Some lace is made at Winslow.

Ivinghoe is in Cotsal hund., 33 m. N.W. of London, just under the N.W. slope of the chalk range. It has a small regular market on Saturday; and two fairs, May 13 and October 17th. The church, dedicated to St. Mary, is a handsome Gothic building. There is an ancient altar-tomb on the N. side of the chancel; it has been disputed whether this was the tomb of Henry, bishop of Winchester, brother of King Stephen. The living is a vicarage, and was in the gift of the late earl of Bridgewater. The par. of Ivinghoe is extensive, and has several dependent hamlets: the pop. of the whole was, in 1831, 1646. Berryishly house, in the town, now a farm-house, is said to have been the seat of Henry, bishop of Winchester.

Some straw plat is made in Ivinghoe. The manor of Ivinghoe, according to tradition, once belonged to the family of Hampden; but one of this family, having had a dispute with the Black Prince, was disinherited and the manor was taken by way of fine or composition. The lines which embody the tradition are thus given by Gough in his Additions to Camden.

Hamden of Hamden did forge
The Tower, West, and Ivinghoo,
For striking the Black Prince a blow.

Mears. Lyons have set aside this tradition, by finding that neither of these three mansors was ever in the Hampden family.

The following two places once had markets, but they are now discontinued.

Fenny Stratford is in Newport hund., on the great Holyhead road, 45 m. from London, and about 7 m from Stony Stratford. It is a chapey dependent upon the parsh of Fenny Stratford. The market used to be held at the Cross, on the market-day through the exertions of the antiquary Bourne Willis, and dedicated to St. Martin. Willis himself is buried within the rails of the communion-table. The market was on Monday while it continued: there are four fairs, April 15th, July 15th, October 15th, and the 11th of November. Fenny Stratford, like Stony Stratford, is on the Watling Street. There is a stone bridge over the Ouse, which flows by the town. Pop. of the chapey, in 1831, 635. In 1665 Fenny Stratford was much depopulated by the plague. There are Baptist and Wesleyan Methodist places
of worship, and a national school. Fenny Stratford gets its name from the nature of the surrounding country: it is itself on a hill.

Some fix the Magovintunus of Antoninus at Fenny Stratford.

Colnbrook is on the high western road, 17 m. from London, near Langley, Bexley, and Iver, (Bucks,) except a small part which is in the parish of Stanwell, Spelthorne hund., co. of Middlesex. The town consists of one long street of neat respectable-looking houses. The Coin here flows in four channels, crossed by a bridge, both built by the crown. The circumstance, combined with the agreement of its distance from London, Camden and others are inclined to regard it as the Pontes of the Itinerary of Antoninus; but in the map of Antient Britain, published by the Society for the Diffusion of Useful Knowledge, in 1827, the Coin is represented as an ancient chantry chapel at Colnbrook, which continued to be used after the Reformation, was endowed by private benefaction in 1682. This old chapel, which was in Langley parish, has since been pulled down and rebuilt on a different site, at Colnbrook and Maidenhead. There are still two fires, on the 8th of April and 3rd of May. The town was incorporated in 1543, by the style of the bailiff and burgesses of Colnbrook.

The following places had charters for markets, which have continued to be held at Bisham, Rayleigh, and Old Bushley, on the border of Northamptonshire; Little Brickhill, near Fenny Stratford; Burnham, between Colnbrook and Maidenhead; Credenhill and Haddenham, on the border of Oxfordshire, near Thame; Hambleden, near Marlow; Haslence, near Uxbridge; Great Harwood and Hoggeston, near Winslow; Iver, between Colnbrook and Uxbridge; Laverden or Lavendon, near Olney; Linclade, on the border of Bedfordshire, near Leighton Buzzard; Muresley, near Winslow; Snelshill, in Whaddon parish, between Stony Stratford and Moulton; Whitchurch, between Aylesbury and Winslow; and Wormehall, on the border of Oxfordshire, near Thame.

Brill, on the border of Oxfordshire, near Thame, is now still: it was in 1831, 1839; but it is said with much probability, that it has a fanatical church, and a fair held at the first week of April, which is a favourite residence of King Edward the Confessor. It is certain that King Henry II. kept his court here in 1150, attended by Thomas a Becket as his chancellor; he was there again with his court in 1154, when Henry III. kept his court at Brill in 1224 (Lysons's Magna Brit.). In the war between Charles I. and his parliament, Brill and Bourstall, a neighbouring vil. (pop. in 1831, 268), were made garrisons by the royal party.

Chalfont St. Giles, on the road to Amersham, is the place where Milton finished his 'Paradise Lost.' Here, too, he is said to have had the idea of his 'Paradise Regained,' suggested to him by his friend Elwood the quaker. The house in which he resided was, when Messrs. Lysons wrote, occupied by a farmer. Here is a school endowed by Sir Henry Palmer, in which the children are instructed, and at Chalfont St. Peter, close by, is a school supported by the Portland family. Pop. of Chalfont St. Giles, 1297; Chalfont St. Peter, 1416.

Hambleden (pop. in 1831, 1357), near Marlow. Greenland farm here; this vil. was at Wat Tyler's rising, a severely contested post in the war between Charles I. and the parliament.

Hampden (pop. in 1831, 286), near Prince's Risborough. The manor was for centuries in the Hampden family, the male line of which became extinct in 1764. The celebrated John Hampden lies buried in the churchyard; and there is a representation of the battle of Chalgrove field, in which he received his death-wound in 1643, on the monument of John Hampden, Esq., the last heir male of the family. Hampden house, the former seat of the Hampden family, contains several family pictures, but the individuals whom they represent are unknown. There is a whole-length portrait of Oliver Cromwell.

Great Missenden, between Amersham and Wendover, was the seat of a rich abbey of the canons of St. Austin. Some part of the conventual buildings remain. The church is a handsome Gothic building. Pop. in 1831, 1527.

Pitstone, antiently Pightelstathorn (pop. in 1831, 578), near Ivinghoe. In this par. was the rich abbey of Ashridge. The abbey, for some time after the dissolution of the community, was a royal palace; and Queen Elizabeth, before her accession, resided here. Part of the conventual buildings remained till the present century; they were nearly all pulled down by the then possessor, the late Lord Wodehouse.

Edward I. spent his Christmas at Ashridge, either at the monastery or at the neighbouring castle of his cousin, Edmund earl of Cornwall, son of Richard king of the Romans, A. p. 1290. He held a parliament there at the same time.

The site of the old abbey, in the parish of Pitstone, was in the manors of Colnbrook and Maidenhead. Pop. in 1831, 1255. The manor was in the reign of Queen Elizabeth seized by the crown for a debt. It was the residence for a time of 'the grave Lord Keeper,' Sir Christopher Hatton; and subsequently of Sir Thomas Coke, who, in his lifetime, retained Queen Elizabeth here, and presented her with jewels to a considerable amount. Upon the death of Sir Edward Coke, to whom the manor had been granted in fee, it came to his son-in-law Lord Purbeck. The manor-house afterwards came into the possession of the family of the Berners of Buckingham; the house was pulled down and re-built. The park is adorned by a colossal statue of Sir Edward Coke, and a sarcophagus on a pedestal has been erected in its vicinity to the memory of the poet Gray.

The old manor house of Stoke Poges is the scene of Gray's 'Long Story;' and the churchyard of his well-known 'Elegy.' The poet spent much of his youth in this vil.; and his remains lie (without any monumental inscription over them) in the churchyard, under a tomb which he had erected over the tombs of his mother and his brother, to arrange to stand, interspersed with columns, obelisks, and towers. They are adorned with arches, pavilions, temples, a rotunda, a hermitage, a grotto, a lake, and a bridge. The temples are adorned with busts, under which are suitable inscriptions. The churchyard is enclosed by a wall built by the then possessor of the manor, the Binghams; it was re-opened by Lord Clarendon, when in the reign of Elizabeth; it was re-built by Sir Richard Temple, who died in 1697, and has been enlarged and improved since. The whole front extends 916 ft., the central part 454. This mansion contains a valuable collection of religious paintings, with the arms of the Binghams. Pop. in 1831, 794.

At Stowe, near Buckingham, is the seat of the Duke of Buckingham. The grounds were originally laid out in strict paths and avenues, and adorned with canals and fountains. Subsequent improvements have been made in keeping with the design of the later century. A band of gentry and amateurs; and the beauties of Stowes have been commemorated by Pope and West, who spent many festive hours with the then owner Lord Cobham. The grounds, when belted from a distance, resemble, like a great park, interspersed with columns, obelisks, and towers. They are adorned with arches, pavilions, temples, a rotunda, a hermitage, a grotto, a lake, and a bridge. The temples are adorned with busts, under which are suitable inscriptions. The churchyard is enclosed by a wall built by the then possessor of the manor, the Binghams; it was re-opened by Lord Clarendon, when in the reign of Elizabeth; it was re-built by Sir Richard Temple, who died in 1697, and has been enlarged and improved since. The whole front extends 916 ft., the central part 454. This mansion contains a valuable collection of religious paintings, with the arms of the Binghams. Pop. in 1831, 794.

Water Stratford, near Buckingham, was the scene of a singular delusion in the latter part of the 17th century. Mr. John Mason, the rector, a man of sincere and fervent piety and troubled conscience, was the deluded one. His fate and curtailment of life, into a delusive notion that he was appointed to proclaim the second advent of the Saviour. Many believed on him, left their homes, and resorted to Water Stratford, in consequence of his declaration that 'the Lord Jesus would appear and condescend to visit him,' Pop. in 1831, 186.

Taplow, on the banks of the Thames, opposite to Maidenhead, may just be mentioned for the sake of noticing
Taplows Court, the seat of the marquess of Thormond; and the former mansion of Cleden House, destroyed by fire in 1795. This magnificent house was begun by the witty and profligate Duke of Buckingham, and was for some time the residence of Frederick Prince of Wales, great-great-nephew of the present king.

Slough, near Windsor, was for many years the residence of Sir William Herschel, and the place where he constructed his two great telescopes. It has been his residence ever since 1816.

Weston Underwood, near Olney, was for some years the residence of the poet Cowper; and some of his descriptions of rural scenery were drawn from nature in his walks round this place.

Buckingham for Ecclesiastical and Legal purposes.—Of the 201 par. 79 are vics., and 29 curacies or donatives. The co. is the most part in the diocese of Lincoln, and in the archdeaconry of Buckingham. Two par., according to Browne Willis (History and Antiquities of the Town, Hundred, and Deanery of Buckingham), four acres of that in Moseley. Lysons (Magnae Britanniae), are in the peculiar jurisdiction of the Archbishop of Canterbury, and four others are included in the diocese of London and archdeaconry of St. Alban's. The several par., by the law of 1792, are divided among the seven rural deaneries of Buckingham, Burnham, Muresley, Newport, Waddesdon, Wendover, and Wycombe.

Buckinghamshire is in the Norfolk circuit; the Lent assizes are at Aylesbury, the summer assizes at Buckingham, and the quarter sessions for the co. at Aylesbury, where also is the co. gaol.

The co. returns three members to parliament, one having been added by the Reform Bill. Aylesbury is the chief seat of commerce, the manufactory of such goods as there, and the return announced: the polling places are Aylesbury, Beaconsfield, Buckingham, and Newport Pagnell. Two members are returned for the hund. of Aylesbury (the right of voting for the bor. of Aylesbury having, in consequence of the corruption of 1835, been thrown open to the freeholders of the hund.) and two each for the bor. of Buckingham, High Wycombe, and Marlow. The whole number of members returned for the co. itself and places within it is eleven. It lost four members by the Reform Bill, and acquired two, each returning two members, having been disfranchised.

Civil History and Antiquities.—Camden and most other antiquaries have included Buckinghamshire, and probably with good reason, in the territory of the Catuvaeuni or Catuvaeuni. This people they consider to be identical with the Cassi, and to have been the subjects of Cassivellanus, who headed the confederate forces of the Britons against Julius Caesar. It may be justly doubted, we think, whether the people called the Catuvaeuni or the Catuvaeuni were the same people. [Britanniae.]

When the Romans, under the command of Aulus Plautius, in the time of the Emperor Claudius, seriously undertook the conquest of Britain, it has been considered by some that they first went, as is supposed by others, in the battle within its borders, the navigable Lud, one of the British chieftains, who was slain. It is not unlikely that this co. was crossed by the Britons in their retreat towards the Severn, and by the pursuing Romans; but we have no data for fixing any conflict of importance within its borders. The death of Togodumnus occurred, it is more likely, in the marshes of Essex, near the mouth of the Thames. When South Britain was subdued by the Romans and divided into provinces, Buckinghamshire was included in Venta Cesaris.

Several of the ancient British and Roman roads crossed this county. The 'Watling Street' coincides with the parliamentary and mail road to Holyhead in that part of it which runs from Brickhill to Stony Stratford through this county. No remains of the elizabethan road itself remain, although the line of its direction is undisputed. The 'Ickling' or 'Icknole Street' runs along the edge of the Chiltern hills, and a road runs nearly parallel to it under the hills, called by the country people 'the lower Achnall way.' The 'Aken Street' was within this county and, but its direction is uncertain. A Roman road, coinciding with part of the turnpike-road from Bicester (Oxon) to Aylesbury, may have been part of a road leading from Alester to Londonium (London) and from the Thames to the sea; and some Roman roads thought to have passed by Water Stratford and Stow in the direction of Towcester. Of Roman stations some notice has been already taken. The 'Magistriu'm' of Antonine may be at Fenny Stratford; 'Lactodorum,' which Camden fixes at Stony Stratford, and Pontes, which he fixes at Colnbrook, are placed by more modern antiquaries at stations beyond the limits of Buckinghamshire; 'Vexatodorum,' at Towcester in Northamptonshire; and Pontes, at Staines in Middlesex. There are several ancient camps or earth-works in the county, chiefly near the edge of the Chilterns, or the course of the Thames: there is an earth-work at Towcester, the ridge of the Chilterns, in the corner of which is a high circular mound or keep, 80 paces in circumference, called 'Castle Hill,' or 'Kimbly Castle.' The name of the adjacent villa. of Kimble (Great and Little) was written in ancient records Kynoble or Cynoble. The site of Buckingham under St. Alban's and under London, Buckinghamshire was the scene of contest, but not of any marked event. Hanslope castle, near Stony Stratford, held for the barons against John by its owner, was taken by the king's favourite, 'Fulk de Brent, A. D. 1213, or 1214.' It is one of the castles mentioned in the great civil war between John and Henry I., and his parliament, the vil. of Brill was garrisoned by the king. Upon this garrison the parliamentary forces under Hampden made some unsuccessful attempts. Aylesbury seems at this time to have been the seat of a bishop. In 1643 the parliamentarians under the Earl of Essex were quartered at different places in the county. Prince Rupert attacked by surprise their quarters at Wycombe and another place, and took several prisoners, with which he retired to Oxford. Buckingham and Stony Stratford were both inclosed in a skirmish which took place on this occasion that Hampden received his death-wound. He lingered in great pain for three weeks and then died. In 1644 the king had his head-quarters at Buckingham. In the same year Boscawen, the royalist, had his head-quarters at Water Stratford, and Castletown, near Stony Stratford, was occupied by the royalists. The remains of the buildings belonging to the various religious establishments are but scanty. There are some very small remains of Buryham abbey and Medeuham abbey. Of Medeuham a short party, having groined arches resting on pillars, with enriched capitals in the latest Saxon or Norman style. Some part of the cloisters of Asbridge monastery escaped destruction by accident, when the other conventual buildings were destroyed. Not far from this place was the Duke of Buckingham's castle, and the ruins of a large building of considerable remains of Nutley abbey, which is now converted into a farm. The buildings occupy three sides of a quadrangle. On the S. side is the hall, 68 ft. long by 24 ft. (nearly) wide, now used as a barn: the style of this building is very different from the rest of the cloister, and bears no resemblance to the English style; part was probably built after the dissolution. Part of the monastery of Muresley (or St. Margaret), in the par. of Tingleho, is yet standing, and is used as a dwelling-house. Lysons (Magnae Britanniae).

Of the churches of early date, Stewkley, between Winslow and Leighton Buzzard (Bedfords.), is the most remarkable. It has usually been cited as a Saxon church, although there is no authentic proof of this. It was erected, not by the Conquest, and it has nothing to distinguish it from other churches erected after that time. It is a good Norman structure; no part of it has been altered internally or externally, nor materially defaced. The porch on the S. side, and the short tower between the nave and chancel, have been added since its erection. (Lysons; Rickman's Gothic Architecture.)

At Hitchenden, near High Wycombe; Stanton Bury, near Stony Stratford; Upton, near Colnbrook; Water Stratford, near Buckingham; and Dinton, near Aylesbury, the churches have some portions of Norman architecture.

Chetwode church, near Buckingham, formerly the church of the priory of Austin Canons, may, from the style of the architecture, be considered as coeval with the foundation of the priory itself, A.D. 1144. Among the most antient and elegant specimens of stained glass to be found in the kingdom. Hillesden church, rebuilt 1493.
Affords a rich example of the style of a later age; it has some good perpendicular parts. (Lysons; Rickman.)

**Education.**—The number of schools and scholars in the county, according to the returns made to the House of Commons in 1835, was as follows:

</table>

The increase in 30 years is thus shown to have been 30,865 persons, or 34 per cent.; the increase in the whole of England during the same period having been 57 per cent.

At the census of 1821 an attempt was made to ascertain the ages of the people, and this experiment proved more successful in Buckinghamshire than in many other parts, the ages of more than 98 in 100 of the inhabitants having been returned: they were as follows:—

<table>

Total of ages ascertained 65,617 68,187 133,754

The pop. of the co., exclusive of the four parliamentary boroughs—Buckingham, Wycombe, Aylesbury, Great Marlow—was, according to the census of 1831, 125,437, leaving 21,992 as the pop. of the four boroughs. The proportions of electors for the co. to the gross pop. of the co. were, in 1832, 1 to 23.65, and in 1833, 1 to 26.25. In the boroughs taken together the proportions were in 1832, 1 in 7.78, and in 1833, 1 in 8.08.

Roads.—It appears from a return made to a committee of the House of Lords in 1833 that the extent of turnpike roads within the county of Buckingham, in the year 1829, was 165 miles. The management of these roads was then conducted by 13 different sets of trustees under the provisions of 33 Acts of Parliament. The sum annually expended in repairs averaged 15,251l.

Poor Rates.—The sums expended for the relief of the poor at each of the four decennial years of enumeration, and in each of the three years following 1831, were:—

Expended.—For relief of the poor | £144,587 17 0 132,937 12 0 |

For local purposes in repairing roads, &c. | 5,625 4 0 |

In suits of law, &c. | 3,515 0 0 |

For other purposes | 12,074 0 0 2,078 0 0 |

£172,285 1 0 £181,150 12 0

*Not separately stated this year.*

## The assessment of 1833, the only year for which such particulars are given, was collected from the owners of various descriptions of property, as follows:—

- On land: £136,225 18 0
- dwelling-houses: 20,429 9 0
- mills, factories, &c.: 3,302 6 0
- manorial profits, navigations, &c.: 828 16 0

= £159,786 11 0

## The county expenditure for various purposes in the year 1833, the latest of which any return has yet been made, was:

- For bridges and roads leading to them: £5,622 9 3
- gaols: 339 12 0
- expenses of criminals tried at quarter-sessions: 944 7 4
- at assizes: 950 6 11
- expenses of coroners: 142 4 6
- militia: 25 2 6

## Crime.—The number of persons tried at the assizes and sessions for criminal offences committed within the county in the three septennial periods ending with 1820, 1827, and 1834, were 145, 906, and 1356 respectively, being an annual average of 75 for the first, of 92 for the second, and 194 for the last septennial period. We have no information concerning the nature of the crimes committed except for the year 1834, when the number of persons charged with offences was 222. Of these, 29 were accused of crimes against the person, 27 were accused of crimes against property, 7 of malicious offences against property, 3 of uttering false coin, 1 of perjury, and 32 of simple breaches of the peace. Of the persons brought to trial 67 were acquitted, and 165 were convicted. Of these 1 was executed, 24 were transported for life, and 20 for terms of years. 116 were imprisoned for various periods, all except 9 for less than six months, 1 was publicly whipped, and 3 were fined and discharged.

Of the persons tried, 218 were males and 14 females: their ages were—

= 218 14

The proportion of offenders to the population was 1 in 422. The centesimal proportions in which crimes of the various classes were committed were:

- Offences against the person: 12 50
- property with violence: 11 64
- without violence: 57 32
- Malicious offences against property: 92 23
- Forgery and offences against the currency: 1 29
- Other offences: 14 23

= 100

The number of persons committed to the county gaol in the course of 1834 was 792, including debtors and persons charged with minor offences, who were summarily dealt with by the local magistrates. Among the number of offenders there were 35 who were known to have been committed before—13 of them once, 7 twice, 8 three times, and 5 four and more times; the cases of sickness in the year were 60, and of deaths among the prisoners 6.

## Savings-Banks.—There are four savings-banks in Buckinghamshire—at Aylesbury, Buckingham, High Wycombe, and Newport Pagnell. The number of depositors and amount of their deposits in each of the three years ending 20th November, 1832, 1833, and 1834 were as under:—

= £136,225 18 0
= 20,429 9 0
= 3,302 6 0
= 828 16 0
= £159,786 11 0
= £5,622 9 3
= 339 12 0
= 944 7 4
= 950 6 11
= 142 4 6
= 25 2 6
BUCK-WHEAT (Polygonum sativum) is said to be found wild in Persia. The cultivation of it, according to many authorities, was as early as that in which the crusaders; according to others, the Moors introduced it into Spain from Africa; and hence it has in France the name of Oed sarrasin. The name of buck-wheat is a corruption of the German buck-wiezen, which signifies beechn-wheat, from the resemblance of the seed to that of the beechn-tree. It is called wheat, because, when grown, it produces a fine farina, which resembles that of wheat in appearance. The botanical name of the genus, Polygonum, is taken from the Greek words polus, much, and grana, grain, from its resemblance to beechn-mast. Buck-wheat grows with a strong heraceous, cylindrical, and branching stem of a reddish colour, about 2 feet high. The leaves, which are ivy-shaped, are placed alternately on the stems. The flowers, but in general, are in the great majority, white, and are succeeded by black angular seeds, formed of four triangles, being thus nearly regular tetrahedrons. The plant is an annual, and the flowers appear soon after it is out of the ground. They continue to blow and bear seed in succession till the frost destroys the plant. Being a native of a warm climate, the smallest appearance of frost in spring, while the plant is tender, entirely destroys it. Hence it is never sown in northern climates till all danger of frost is over, which in many parts of England is not till the middle of May; but its germination is so rapid, that it might be sown in September, at which time the principal part of the blossoms will have ripened their seeds. No advantage would be gained by leaving it longer on the ground, for even if the frost did not kill the whole plant, the earliest ripened seeds would be shed and lost; and the last blossoms would not produce perfect seeds.

The cultivation of buck-wheat has never been very extensive in the variable climate of Britain. It is not so well adapted to cold moist soils as to soils in colder countries, such as oats or barley on lands which are suited to the growth of these grains. For countries where there are very poor light lands with a hot dry climate, unfavourable to the growth of oats, and not rich enough for barley, buck-wheat is a great good as a fallow, and may be considered as a substitute for both, as it is one of the hardest crops, and one of poor land would scarcely be capable of supporting a population. As a principal crop, therefore, it is confined to some parts of the south of France and other countries similar in soil and situation. As a secondary and occasional crop, it often occurs in Switzerland, Germany, and especially in Flanders, where it enters as a regular part of their varied and complicated rotations. Under particular circumstances, it might be introduced with advantage into many parts of England where it is now unknown. The only counties in which it is cultivated to a moderate extent at present are Norfolk and Suffolk, where it is called brank. If a small patch of buck-wheat is occasionally met with elsewhere, it is, in general, mainly for the sake of encouraging game, particularly pheasants, which are extremely fond of it.

When sown as a principal crop it is sown either as a green crop, especially in warm and dry seasons. On richer and better soils it may be occasionally a good substitute for barley, when the land cannot be properly cleaned and tilled sufficiently early in spring; for it allows a full month more to prepare the ground; the crop may be hoed twice, the first time dry, a good fillage may produce nearly all the advantage of a summer fallow. Buck-wheat, on good land, will produce nearly as valuable a crop as barley, though it is certainly more precarious; the seed sown with it will probably produce more grass or clover than they would if sown with wheat; for buck-wheat, sown in this case, does not choke the grass, but shelters it from the scorching rays of the sun; and as it draws the land less than any other grain, it leaves it in better heart for the clover. It has been strongly recommended to be sown on good, close-grassed land, to which it may be allowed to grow, and then, before it is pulled, fed off by sheep or cut green for horses. By this means, the root weeds, which had been smothered by the tares and ploughed up immediately after the tares were off, will not have time to spring up again; the rapid growth and the sudden cutting will prevent the root weeds, otherwise effective in preventing the annual weeds from going to seed. Thus a crop is obtained between the tares and the wheat, and the land is kept perfectly clean. This is mentioned by Arthur Young, in the Survey of Suffolk, as a successful practice, which may not receive much attention, as it is always advisable to introduce into the ground in a green state. For this purpose, it is sown tolerably thick, and when the plant is in its greatest vigour and in full blossom, a roller is passed over the crop to bring it level with the ground. In this state, with the addition of a skim coulter, it turns neatly into the soil, and completely buries it. It soon decays from its own moisture, and the decomposed parts being incorporated with the soil greatly add to its fertility.

It is poorly adapted to cultivated soils, especially if they are trenched to a considerable depth, buck-wheat may be sown with great advantage for the purpose of being ploughed in as a preparation for the first crop of turnips. The turnips fed off by sheep penned on them will enrich and consolidate the surface of the land, and by the quick growth of the buck-wheat, get rid of weeds, and the decaying stems leave it very loose and hollow; but if the soil is moist and the air which is wet in mellow it and makes it crumbling, which is a great advantage. Provided the soil is stony and not compact, nor, on the other hand, too rich and poor or light it may be, or however dry the weather, it will produce a good crop of seed. It only wants a few showers at first, and at the time when the seeds begin to be formed, to bring the blossoms to their height, and if the first-formed seeds should not be so full as might be wished, the later may probably make up for it. The careful husbandman must examine the plants at different periods, and reap when he finds the greatest quantity of ripe and full seeds.

It is generally recommended as not being a mucilagineous crop, and the flowers come to seed in perfection, but under favourable circumstances from four to five quarters of good seed may be obtained from an acre of well-tilled land.

Manure is seldom or never laid upon land in which buck-wheat has been sown, as it is thought that the manure is reserved for other crops supposed to require it. It is asserted by many that manure makes the buck-wheat run to haunch and diminishes the crop of seed. That this may be the case, with injudicious additions of dung, we are not inclined to dispute; but if the land was tilled to a sufficient depth, if the manure was well prepared and intimately mixed with the soil, and if the buck-wheat was sown thin in proportion to the richness of the land, we have no doubt that it would not only grow high and strong and blossom well, but would produce a much better manure for the new crop. As to the objections that the crops run to straw and are deficient in corn, when the land is moist and has been highly manured, is, that the manure ploughed in and covered only with a few inches of soil exhausts the moisture which makes it shoot out a strong vigorous corn, but by the time of flowering the dry weather has exhausted the rich moisture of the manure, and the plant, pushing its roots downwards in search of food, finds a less fertile soil below, and the crop is weakened by which it cannot fill the manure to form a good plump seed. But when a soil is naturally rich, or artificially made so to a considerable depth, a strong and high stem is generally the forerunner of a great bulk of seed, as is often seen in those oats which are scattered thinly among winter wheat, and even when they are cut down, if allowed to ripen, is always both heavy and abundant.

Buck-wheat is sometimes cut in its tender state for 3 X 2
soiling cattle. It is said to increase the milk of cows greatly: it is also occasionally pastured by sheep. There is a diversity of opinion on its qualities, some speaking highly of it, and others denouncing it. One supposes, of truth, that it is not eaten by sheep or cattle in preference to any other plant, and that it has a stupefying and intoxicating effect when eaten in any great quantity. Upon the whole, we are inclined to think that its value is chiefly as an addition to the plants cultivated for their seeds, and as a cheap vegetable manure.

Buck-wheat may be reaped with the sickle or mown with the scythe, or it may be pulled up by the roots. The latter method is recommended in dry weather, as less likely to shed the seed when gathered. In dry weather it is recommended to cut or pull it very early in the morning or late at night, when the dew is on it, and not to move it much in the day. It may be tied up in sheaves or put into small heaps, as is done with peas. In either case birds must be carefully scared away, or they will take a large share of the produce.

Buck-wheat as a grain may be given to horses instead of oats, or mixed with them. No grain seems so eagerly eaten by poultry, or makes them lay eggs so soon and so abundantly. The meal, when it is ground, is excellent for fattening cattle or pigs. The flour is fine and white, but from a deficiency in gluten does not make good fermented bread. It serves well for pastry and cakes; crumpets made of buck-wheat flour eaten with jam or honey have a pleasant taste. In Holland, hasty pudding is also made of the flour with water or milk, and eaten with butter or sugar.

On a careful consideration of the reasons for and against a more general cultivation of buck-wheat and similar crops in this country, it appears that certain qualities which make it well worth attention. As it belongs to a different natural family in the vegetable kingdom it is probable that it may be a useful change when the land has been too long cropped with grainy plants. It may impart to the soil, or, as is more usual, be lost, certain principles by which its power of producing other crops may be increased. This can only be learned with certainty by repeated experiments; but some considerable effect may be expected from the powerful salts which are better inhaled than used as manure. The manure is indispensible; the only thing required is an accurate calculation of the comparative expense of its application, with that of bones or other purer purchased manure, taking quality and quantity into consideration. A few experiments on a small scale, and with the assistance of minute circumstances which is so often neglected in agricultural experiments, and repeated with perseverance, might place the cultivation of buck-wheat in a new point of view.

The result of the analysis of the ashes produced by burning buck-wheat straw as given by Vauquelin is

These results will no doubt vary according to the soil in which the plants have grown. The carbonate of potash is so abundant that it has been suggested as a profitable use for the manure. The carbonate of magnesia is the chief use of the manure. The colour, being a smaller seed, but is much harder. Its stubble will remain alive during the winter, grow out in spring, and produce a second crop the next year if left alone; but this does not seem any great advantage, as the second crop is very apt to be inferior in quality. Yarranton mentions a crop grown in the Department de l'Isère which appears extraordinary; 12 measures sown produced 1296 measures, or more than a hundredfold, in a very dry season. Another gentleman obtained 80 for one. Notwithstanding these accounts, Thaer, who has repeatedly tried it, says that 'its presence is injurious, and it produces no advantage of which it is capable.' (vol. iv. s. 162.) Perhaps the experiments made in a rich spot in a garden have given results which multiplied the above extraordinary returns. Agricultural experiments are unfortunately often made in this way, and conclusions from them are more generally to be relied upon than from experiments made on the island exhibits abundance of pastoral scenery. Others have said, that on the invasion of Greece by the Persians, when the festivals of Diana were suspended, the country people thronged the temples and sang hymns to that goddess concerning their rural occupations, which thence were called Bucolic. There has been equal difference about the name of the inventor, and Dioscorus and Daphnis, whoever they may be, Steichorus and Theocritus, has each had his support for the other. But as it is forgotten that she is one thing to sing as shepherds do while tending their flocks, and quite another thing to sing as poets do when relating the life of shepherds.

Theocritus, Moschus, and Bion, have written Bucolics in Greek, and Callimachus and the Sicilian Epimenius or Epymenius, a later Latin poet, has shown us how tame and insipid Bucolic poetry may be. Such beauties as these compositions contain are chiefly comprised in delicacy of expression and refinement of language. Bucolic poetry has been little cultivated by the moderns; the French have converted it into mawkish gallantry; and the rank which it maintains in England may be estimated, when it is stated that Cunningham and Shenstone have been its principal ornaments. Those who deem this subject worthy of consideration, will find it amply treated in the works of i. 4; 'Salmacius on Solinus,' pp. 851, 857; and the dissertation prefixed by Heyne to his edition of the Eclogues of Virgil.

BUCU [DIOIMA].

BUD, or LEAF-BUD, in vegetable physiology, is the organized rudiment of a branch. Whatever becomes a branch is, when first organized, a bud; but it does not therefore follow that all buds become branches; on the contrary, owing to many disturbing causes, to which reference will be made, buds may abort into flowers, other inflorescences, or other contrivances which mask their real nature.

A leaf-bud is constructed thus:—In its centre it consists of a minute conical portion of soft succulent cellular tissue, and over this it is distributed in layers, the deeper layers being in the form of scales. These scales are closely applied to each other; those on the outside are the largest and thickest, and the most interior are the smallest and most delicate. In cold countries the external scales are often covered with hair, or a resinous varnish, or some other contrivance which enables them to prevent the access of frost to the young and tender centre which they protect; but in warm countries where such a provision is not required, they are green and smooth, and much less numerous. The cellular centre of a leaf-bud is like that of an ordinary bud, except that the parts towards the development of which its vital energies are first directed.

A leaf-bud usually originates in the axil of a leaf; indeed there are no axils in the axil of which one or more buds are not found either as rudimentary or as actual or as cellular centres communicate with that of the woody centre of the stem, and its scales are in connexion with the bark of the latter. When stems have the structure of Exogens, the bud terminates one of the metamers or phylloids; in Endogens it is simply in communication with the cellular matter that lies between the bundles of woody tissue in such stems. It is moreover important to observe that this is true not only of what are called normal buds, that is to say of buds which originate in the axil of the leafy organs, but also of adventitious buds, or such as are occasionally developed in unusual circumstances. It would seem as if, under favourable circumstances, buds may be formed wherever the cellular
BUD
325
BUD

Tissue is present; for they occur not only at the end of the medullary processes of the root and stem of Excogetes, but on the margins of leaves, as in Bryophyllum, Malaxis paludosus, and many others; and occasionally on the surface of leaves, as in the case of an Ornithogalum published by Fuchs. They are not uncommonly in form.

A leaf-bud has three special properties, those of growth, attraction, and propagation. In warm damp weather, under the influence of light, it has the power of increasing in size, of developing new parts, and so of growing into a whole plant. Thereafter veritably, and for ever, destined for. In effecting this it lengthens by the addition of new matter to its cellular extremity, and it increases in diameter partly by a lateral addition to the same kind of tissue, and partly by the deposit of woody matter emanating from the bases of the leaf-buds. When this deposit commences, the sap which a bud contains is either expended in forming new tissue, or lost by evaporation; in order to provide for such loss, the bud attracts the sap from that part of the stem with which it is in communication; that part supplies sap up to its turn from the tissue next it, and so a general movement towards the buds is established as far as the roots, by which fresh sap is absorbed from the soil. Thus is caused the phenomenon of the flow of the sap. Every leaf-bud is in itself a complete bud; and the first bud of the Blacxbasian bee is a bud-test, and not a bar. Although it is usually called life while attached to its parent plant, yet it is capable of growing as a separate portion, and of producing a new individual in all respects the same as that from which it was divided; hence it is called a normal brute, and as a seed, although not of the same kind; and advantage has been taken of this for horticultural purposes. [Budding.]

In general a bud is developed into a branch; but that power is interposed with or destroyed by several causes. This may be illustrated as follows: independently of all other. Every one knows that leaves are arranged with great symmetry upon young branches; as buds are axillary to leaves, the branches they produce ought therefore to be opposite to each other, and, a spurious leaf, as this we see does not happen. We may account for this in two or three ways: accidental injuries will doubtless destroy some; from want of light others will never be called into action; and of those which are originally excited to growth a part is always destroyed by the superior vigour of neighbouring buds, which attract away their food and starve them. There is moreover in many plants a special tendency to produce their leaf-buds in a stunted or altered state. In fir trees the side buds push forth only two, or a small spurious leaf, and the latter is lost; while in the cedar of Lebanon they lengthen a little, bear a cluster of leaves at their points, and resemble short spurs; in the sycamore, the whitebark, and many other plants, they lengthen more, produce no leaves except at their very base, and grow into low spreading trees. In the Cotoneaster, the leaf-buds, with unusually fleshy scales, and with the power of separating spontaneously from the mother plant; and flower-buds are theoretically little more than leaf-buds without the power of lengthening, but with the organs that cover them in a special state. Hence flowers are modified branches. [Flower.]

Buda, or OFEN (the first name, as well as the Sclavonian 'Budin,' being that by which it is known in the eastern part of Hungary), is on the right bank of the Danube, in the circle of Pesth, and nearly in the centre of the kingdom of Hungary, is united with Pesth, which lies opposite to it on the left bank of that riv, and is joined to it by a bridge about 3800 ft. in length: the two towns constitute the metropolis of Hungary; the city was first established to derive its name from Buda, a brother of Attila, who made the town his residence, and much enlarged it. On the other hand, Alt-Ofen, which extends further up the Danube, and is looked upon as a separate quarter of Buda, and is a part of the Hungarian capital, is derived from the name of the Romans, and was by them called Scambria. The name of Ofen (oven or kiln) has been given to it by the Germans, who form the bulk of its inhabitants. It was the spot where the modern Hungarian nation was first established, and gave the name to the rank of a royal free-town by Bela IV.; and became the seat of government in the year 1784. Buda, from its greater antiquity, has not in any way been styled the mother of Pesth. It is built round the Schlossberg in the midst of a mountainous and picturesque country, bordering E. on the banks of the Danube, and encircled by vineyards and forests on the other three sides; it is about 9 m. in circuit, and according to Blumenbach contained three years ago 3089 houses and 29,457 in habitants, independently of the garrison and strangers. These numbers exhibit an increase of 2509 since the year 1804, when they were 2278 families and 24,948 in habitants. The central part of Buda is comprehended in what is called the, a long narrow street with remarkably high houses; and further to the E. of both stands the New-town (or Neu-stadt), a more populous, but on a less lofty scale of construction, with a line of warehouses on the Danube; this suburb is immediately S. of Alt-Ofen. The fourth is 'Tabor' or 'the Raizen-town,' which skirts the Schlossberg on the S., and is the largest and most populous of any quarter outside of the walls. North of the Raisentown, between this and the Via Regia, lies 'Christians-town,' which is full of gardens, and built in the valley that separates the Schlossberg from the vine-clad heights which extend W. of it. To the S. of the whole there is a lofty eminence called Buda hill. According to the census of 1812, the Royal Observatory has been built, and its sides are studded with a multitude of small isolated villas and houses. The Fortress, which occupies about a twelfth part of the entire area of Buda, is laid out on a regular plan, and is full of streets, houses, and spacious gardens, and is as a seed, although not of the same kind; and advantage has been taken of this for horticultural purposes. [Budding.]

In general a bud is developed into a branch; but that power is interposed with or destroyed by several causes. This may be illustrated as follows: independently of all other. Every one knows that leaves are arranged with great symmetry upon young branches; as buds are axillary to leaves, the branches they produce ought therefore to be opposite to each other, and, a spurious leaf, as this we see does not happen. We may account for this in two or three ways: accidental injuries will doubtless destroy some; from want of light others will never be called into action; and of those which are originally excited to growth a part is always destroyed by the superior vigour of neighbouring buds, which attract away their food and starve them. There is moreover in many plants a special tendency to produce their leaf-buds in a stunted or altered state. In fir trees the side buds push forth only two, or a small spurious leaf, and the latter is lost; while in the cedar of Lebanon they lengthen a little, bear a cluster of leaves at their points, and resemble short spurs; in the sycamore, the whitebark, and many other plants, they lengthen more, produce no leaves except at their very base, and grow into low spreading trees. In the Cotoneaster, the leaf-buds, with unusually fleshy scales, and with the power of separating spontaneously from the mother plant; and flower-buds are theoretically little more than leaf-buds without the power of lengthening, but with the organs that cover them in a special state. Hence flowers are modified branches. [Flower.]

Buda, or OFEN (the first name, as well as the Sclavonian 'Budin,' being that by which it is known in the eastern part of Hungary), is on the right bank of the Danube, in the circle of Pesth, and nearly in the centre of the kingdom of Hungary, is united with Pesth, which lies opposite to it on the left bank of that riv, and is joined to it by a bridge about 3800 ft. in length: the two towns constitute the metropolis of Hungary; the city was first established to derive its name from Buda, a brother of Attila, who made the town his residence, and much enlarged it. On the other hand, Alt-Ofen, which extends further up the Danube, and is looked upon as a separate quarter of Buda, and is a part of the Hungarian capital, is derived from the name of the Romans, and was by them called Scambria. The name of Ofen (oven or kiln) has been given to it by the Germans, who form the bulk of its inhabitants. It was the spot where the modern Hungarian nation was first established, and gave the name to the rank of a royal free-town by Bela IV.; and became the seat of government in the year 1784. Buda, from its greater antiquity, has not in any way been styled the mother of Pesth. It is built round the Schlossberg in the midst of a mountainous and picturesque country, bordering E. on the banks of the Danube, and encircled by vineyards and forests on the other three sides; it is about 9 m. in circuit, and according to Blumenbach contained three years ago 3089 houses and 29,457 in habitants, independently of the garrison and strangers. These numbers exhibit an increase of 2509 since the year 1804, when they were 2278 families and 24,948 in habitants. The central part of Buda is comprehended in what is called the, a long narrow street with remarkably high houses; and further to the E. of both stands the New-town (or Neu-stadt), a more populous, but on a less lofty scale of construction, with a line of warehouses on the Danube; this suburb is immediately S. of Alt-Ofen. The fourth is 'Tabor' or 'the Raizen-town,' which skirts the Schlossberg on the S., and is the largest and most populous of any quarter outside of the walls. North of the Raisentown, between this and the Via Regia, lies 'Christians-town,' which is full of gardens, and built in the valley that separates the Schlossberg from the vine-clad heights which extend W. of it. To the S. of the whole there is a lofty eminence called Buda hill. According to the census of 1812, the Royal Observatory has been built, and its sides are studded with a multitude of small isolated villas and houses. The Fortress, which occupies about a twelfth part of the entire area of Buda, is laid out on a regular plan, and is full of streets, houses, and spacious gardens, and is as a seed, although not of the same kind; and advantage has been taken of this for horticultural purposes. [Budding.]

In general a bud is developed into a branch; but that power is interposed with or destroyed by several causes. This may be illustrated as follows: independently of all other. Every one knows that leaves are arranged with great symmetry upon young branches; as buds are axillary to leaves, the branches they produce ought therefore to be opposite to each other, and, a spurious leaf, as this we see does not happen. We may account for this in two or three ways: accidental injuries will doubtless destroy some; from want of light others will never be called into action; and of those which are originally excited to growth a part is always destroyed by the superior vigour of neighbouring buds, which attract away their food and starve them. There is moreover in many plants a special tendency to produce their leaf-buds in a stunted or altered state. In fir trees the side buds push forth only two, or a small spurious leaf, and the latter is lost; while in the cedar of Lebanon they lengthen a little, bear a cluster of leaves at their points, and resemble short spurs; in the sycamore, the whitebark, and many other plants, they lengthen more, produce no leaves except at their very base, and grow into low spreading trees. In the Cotoneaster, the leaf-buds, with unusually fleshy scales, and with the power of separating spontaneously from the mother plant; and flower-buds are theoretically little more than leaf-buds without the power of lengthening, but with the organs that cover them in a special state. Hence flowers are modified branches. [Flower.]
spinning-will for silk thread, and an earthware and a tobacco manufactory. A few woolens and linens are also made. The trade of the town principally consists in the wines produced by the vineyards in the environs, to the average amount of 140,000 or 150,000 anuals (2,100,000 to 2,250,000 gallons). The red is marked specially under the name of Jaffa wines, or about 4,500,000 gallons, are made. The bulk of this wine, which is not much inferior to Burgundy, and is well known under the name of 'Fermer-Wein,' comes from the extensive vineyards belonging to the town itself, which are considered the best in the country, and the production of 70,000 gallons.

Independently of a theatre, Buda possesses within its walls a variety of places for public amusement, and without them, an inextinguishable fund of attractions in the beauty and diversity of the surrounding country. Buda was captured by the Turks from the Ottomans in 1541, and remained in their possession until the year 1686.

BUDA, BUDDHISM. Among the religions of Asia, that of Buddhism is one of the most remarkable, partly for the peculiar character of its doctrine, and partly on account of the vast number of adherents. From India, the country which gave it birth, nearly every trace of Buddhism has now disappeared; but it has become the religion of the great majority of the inhabitants of the high table-land to the north of the Himalayas as far as Turkestan. It is the prevailing creed of China, of the Peninsula of India beyond the Ganges, of Ceylon, and several islands of the Indian archipelago, and of the empire of Japan. According to an estimate given by Hasse, there are, at present, in the Buddhist countries, 120 millions of Chinese, 40 millions of Japanese, 120 millions of Jowans, 7 millions of Mohammedans, and 11 millions of Buddhists, or 319 millions in all. Though much has been written upon Buddhism, a critical investigation of the system, its system of doctrines, and the history of its diffusion among so large a portion of mankind, is still a desideratum. Hardly any of the original authentic documents of the sect, which are written in Sanskrit, have yet been fully examined, and the information which we now possess is not a trustworthy basis on which to build. It is generally believed, that in the second century, after the time of the Buddha, six terms descriptive of his hair are enumerated (ayonjana, No. 72—78), which, though some are not very clear in themselves, seem to attach a notion of beauty to its peculiar appearance: this could hardly be the case if the hair had been considered a sanitary instrument, and the preservation of the hair. The answer which Mr. Hodgson obtained from a priest in Nepal to an inquiry respecting the reason of Buddha being represented with curled locks was to this effect, that it was considered a point of beauty; still the fact that the Buddha now observes, an odd one for a sect which insists on tonsure.

The Buddhists themselves, however much they may disagree as to the period at which the founders of their religion lived, make no pretensions to a very high antiquity of their institution, but claim a date much more remote. The superior antiquity of the Buddhists over the Brahmanism has by some been asserted, are, 1st, the existence of large architectural remains evidently referable to the Buddhist sect, which are widely spread over nearly the whole country now occupied by the various sects of the Brahmanical profession; 2nd, the entire absence of every living remnant of the Buddhist sect throughout India, which presupposes that it must have ceased to exist at a very early date; 3rd, the admission of the Brahmanical sect that the Buddhists invaded India from the north or north-west, which might seem to favour a conjecture that the earlier inhabitants of the country, whom they subdued and subsequently expelled, were Buddhists; and 4th, the peculiar characteristics of Buddhism, which is in many respects simpler than Brahmanism, e.g., in the absence of castes, and thus seems to agree better with our notions of the state of society in the early stages of its development. It will however be shown that these arguments are not conclusive. The existence of architectural remains, far from establishing any claim on the part of the Buddhists to absolute priority, only proves that the sect to which these monuments belong must for a time, and probably at a later period, have occupied a greater extent of country; also that it had attained considerable proficiency in the arts of architecture and sculpture, which would naturally lead us to presume an advanced state of general civilization. That there are no Buddhists at present beyond the confines of their country is to be inferred from the circumstance that those monuments, may be considered as corroborating the well-established report of the violence and intolerance with which the Buddhists were for many centuries persecuted in India, and at last, in the seventh century of our era, were expelled from the northern parts of the country. The Boudhadas were in the possession of the country at the time when the Brahmanic tribes invaded it, is likewise subject to serious doubts. The caste named Suidras in the Brahmanic code of laws, and our, in our opinion, of such of the original inhabitants of India as became reduced, and who were suffered to continue in the country where the conquerors settled, but were entirely dependent on the will of the latter, and did not participate in any of those civil rights which the Brahmanic community conferred on its members.
The circumstances of the life of Buddha, which we find recorded, are only few. Conformably to the prevailing usage of the country, the infant was, a few days after his birth, presented before the image of a deity, which is said to have inclined its head when the child was brought near it; and for this reason he was named the 'Mind of the Future.' At the age of twenty years the boy was placed under the guidance of a spiritual instructor, whose name, according to a Mongol account of the life of Buddha, was Bab-Burenu Bakshi. He soon developed mental faculties of the first order, and became equally distinguished by the piety of his person. At the age of 20 years he married a noble virgin called Yasodhara Devi in the Ceylonese account of his life. He had by her two children, a son (whom the Mongols call Racholi, the Ceylonese, Rahul Kumareya) and a daughter. At this time it is stated that he became fully conscious of the depravity and misery of mankind; began to engage his mind, and he conceived a plan of retiring from human society and becoming a hermit. His father endeavoured in vain to frustrate this design; Buddha escaped the vigilance of the guards appointed to watch him, and took his abode on the banks of a river, named in the Mongol history Arasara or Narasara, in the kingdom of Udipa. Here he lived during six years, undisturbed in his devout contemplations. At the expiration of this period he came to a resolution of founding a religious order. Being instructed in the sacred sciences by his teacher. It is said that, by some who heard him, doubts were at first entertained as to the soundness of his mind; but his doctrines soon gained credit, and were propagated so rapidly that Buddha himself lived to see them spread all over the Indo-Germanic race. Before the year 563, he had brought into a tabular arrangement no less than 35 different statements as to the time when Buddha died. Eight of these vary between the years 5420 and 1502; between the years 6061 and 1000; and between the years 959 and 543 before our Christian era. The concurrence of a comparatively large proportion of those statements, in placing Buddha in the eleventh century, is remarkable, and, combined with other circumstances hereafter to be mentioned, renders it probable that the Mongol account which fixes his birth in either 1292 or 1197, and his death in 942 or 947 before Christ (Schmidt, i. e., p. 314), may come very near the truth. The discrepancy of the other accounts may perhaps to a certain extent be accounted for by the fact, that when the lamas of the various sects, Iclavangs, Siamese, Burmese, and Ceylonese Buddhists, who assign a comparatively recent period, confounded the original author of the sect with one of his successors, who likewise received the title of Buddha; and the very early dates given by some, chiefly Tibetan Buddhists (e.g., 914 B. C. according to Sanang Sweten), may possibly owe their origin to the notion of six sages, similarly gifted with divine wisdom, who are said to have preceded Sakyasina. (Hodgson, Trans. of the Roy. Asiat. Soc., i., p. 239.)

According to the concurrent traditions of the Buddhists, in various parts of Asia, the founder of the sect was the son of Suddhodana, King of Magadha, and his mother was Surodvati, or Sarvatattvaditi; but he was frequently called by what appears to have been a sort of patronymic designation, Gautama, and by the complimentary surnames Sakyasina and Sakyamuni, i.e., the lion or the deer (of the Sakyas) in the Sanskrit language, which has been corrupted into Shigimmu; Gautama, preceded by the honorific Sanskrit title of Sramana, the ascetic, has, in Siamese, become Sommona; and the Chinese have converted Magadha into Moki-to, under which name they comprehend India generally, a name which has been corrupted into Fo-to and Rosi; and Suddhodana, like many other Sanskrit compound names, they have analyzed and translated into their own language by King-fan-wang, i.e., the eater of pure food.
of Ho-nan. He died there in A.D. 495. The fact that no more than 28 patriarchs are enumerated in a period of 1445 years (between 950 B.C. and 495 A.D.) would alone be sufficient to convince us that the list is imperfect, and that many names are wanting in it. The list indeed corresponds to the following: the previous years. The precise date of the accession or death of several of the patriarchs is stated not to be found on record, or to be known only approximately; and these undisguised imperfections, which an intention to deceive on the part of the compiler, might so easily have concealed, are calculated to confirm rather than to weaken our faith in the authenticity of the document.

Mr. Wilson, in his account of the 'Radj Tarangini,' a Sanskrit chronicle in verse, of the country of Cashmir (As. Res., vol. xvi. p. 111), gives the name to this passage which he translates 'dotes upon the world.' — 'When 150 years had elapsed from the emanicipation of the Lord Śīkṣāsini in the epoch of the world, a Bodhisattva in this country (Cashmir), named Nāgdrūpas, was Bhūmīśvarā (lord of the earth). As previous passages of the same chronicle allude to Buddha behind the scenes in Cashmir, Mr. Wilson is of opinion that Śīkṣāsini, the founder of the sect, has been here confounded with one of his successors, a Bodhisattva of the sixth century B.C. In the list of early Bodhisattvas published by Rāmasū, (compare Kālānā, in the Newcomer Journal, vol. iii. 1843, p. 243), we find one 'Foethomanthi, (Būhdhānandī?) of Kanara, of the family of Gau-tama,' who is stated to have died in the year 535 B.C. We think it not unlikely that this may be the person intended in the passage quoted by Mr. Wilson. Deducting 150 years from the date after which we have our year 383 B.C. as the epoch at which the chronicle speaks of a Buddha who resided and lived in Cashmir as spiritual chief, (according to Mr. Wilson's illustration of the text,) contemporary with Goncordia, a temporary religion.

The name of a sect to the sect of Buddha in any western writer has been supposed to occur in Herodotus (iii., c. 109; Kora, Propr. Hel. Bibl. p. 571), who says of certain Indians, that they kill no animals, and live on the vegetable products sprung by the soil. This may, however, possibly allude to the very words of Herodotus, in a detached passage where he speaks of an abstruse sect called Artoni (Arūrōn), which name seems to be the Sanscrit Arhat, or Arhata, a very common designation of the Cashmir sect, who are even more distinguished than the Bhuddhas by their extreme tenderness for animal life. Arrian (Indic., c. 8) mentions the name of an ancient fabulous king of India (Bodhāca), which resembles that of Buddha in sound; but the context in which it occurs does not prove that the word was the name of a Brahman (Indien, i. p. 319), that the founder of Buddhism be intended. Strabo (xv. c. i, p. 712, ed Cassub.), on the authority of Megasthenes, states that there are two classes of philosophers among the Hindus, the Brahmanes and Garmaches. Megasthenes account of the Garmaches who are by Clemens of Alexandria (Ström, i. p. 305) more correctly called Sarmanes, it is clear that by them the Brahmanes are to be understood. The name Sarmanes appears to be the Sanscrit word Sarmana, a religious mendicant, an ascetic, a sort of a Brāhman who was a denizen of the world, a Brāhman in the 'Mríchhakati, a Sanskrit drama, supposed by Mr. Wilson to have been written either one century before, or two centuries after our era (vii. p. 215, ed. Calcutt.) We recognise the same word under a slightly modified shape in a second Sanskrit text, the greatest and most important of the Indian philosophers, Sarmanes Chaun (Sāmanes Ācārya, written in some MSS. Zāmānēs, Zāmanoś, Zāmānēs, Zāmano-śan; and in Dion Cass. liv. c. 9, Zāmańos, Zāmanos, or Zāmanos), who came to Europe with an embassy from king Paros to Augustus, and voluntarily burnt himself at Athens. (Strabo, xcv. c. i. pp. 719, 720.)

Two very remarkable passages on the various sects prevailing in India occur in Clemens of Alexandria. In the first (xv. c. i. p. 559, ed. Potter) he says that there are two classes of people, named the Sarmanes and the Brāhmanes. 'Among the Sarmanes those called Hyloubi (Hīlobi, Mountagu thinks, should be read instead of Ηλλοβιος) do not dwell in towns or houses; they are clad with their hands, eat with their hands; they know not marriage, nor procreation of children.' He then proceeds to say that 'there are likewise among the Indians persons observing the precepts of Butta (Butos), whom they venerate like a god on account of his extreme sanctity.' Here the followers of Butta (Buddha) are distinctly distinguished from both the Brahmanes and Sarmanes. In the second passage (p. 539, ed. Potter) Clemens speaks of a sect whom he calls 'Sarmanes of the Sanskrit name Sarmanes': 'they go naked all their lives; they make it a point always to speak the truth, and they inquire into the future. They worship a certain pyramid, beneath which they believe the bones of some god to be deposited. Neither the Gymnacides nor the Sarmanes have any intercourse with women, for they deem this contrary to nature and to law, and for that reason they adhere to chastity. There are also females of this class (Σαρμαναία) who live in perpetual virginity.' The pyramids here spoken of are evidently the dagobas of the modern Buddhists.

The statements respecting the religion of India and China given by the two Arabian travellers who visited these countries in the ninth century (Renaudoit, Anciennes Relations des Indes et de la Chine, &c., Paris, 1716, 8vo.) are too vague to enable us in every instance to discern whether the 'pagans,' of whom they speak, were Buddha or not. In the report of the first traveller (l. c. p. 3) we meet with an allusion to the impression of a foot on Adam's Peak in the Island of Ceylon, a spot known to Ebn Ba'tuts (Lee's translation, p. 189) as a place of pilgrimage, which it has continued to be till the present day with the Ceylonese Buddhists: the second traveller, in speaking of the natives of India, calls their priests Brahmanes (l. c. p. 107), and in the account which he gives of their ascetics, speaks of the 'Buddhistes' (l. c. p. 107) as the ascetics. That would, in our opinion, admit of an application to the Buddhas. These statements, though not very explicit, are yet interesting, as they seem to attest the expulsion of the Buddhists from India some time previous to the ninth century, and to enhance the sanctity of the place.

In the Anti-Islamic portion of the Arabic chronicle of Abulafa, published some years ago by Fleischer (Abulfeda, Hist. Antestacomica, &c., ed. H. O. Fleischer, Leipzig, 1851, 4to.), there is a curious chapter on the various tribes or sects of the Indians. In this, Desaguliers speaks of a writer who flourished in the first half of the twelfth century. Most of the Indian tribes, or rather sects, there noticed, are easily recognised even under the somewhat adulterated names given to them by the Arabs, as various branches of Brahmanic Hindus; and the only sect, the name of which bears any similarity to that of the Buddhists, the Behudhit (al Bahuddiyah, in the Arabic text), are described in a manner which removes every possibility of their being taken for followers of Sākṣīsina.

This is the case with the Kāmpions, a sect who record him, who is the most famous of the Indian philosophers, being the author of the great treatise called the Sāhīs, in which he avowed his claim to the sovereignty of India. He was regarded as a philosopher of the highest order, and was named Sāhīs (Sāhīsh, the Arabic text); this prince reigned about the year 1202, and was dethroned by Gengizkhan. (Kapistr John.)

However small is the information to be gathered from these
passages of foreign writers as to the history of Buddhism, it is at least in accordance with the traditions preserved among the Buddhists themselves. For several centuries after the appearance of Sākyamuni his sect seems to have flourished in India, and to have been tolerated by the Brahmanas in naked subserviency. The government among Hindus who follow the religion of the Vedas, Buddhism appears during this period to have penetrated the peninsula in every direction; and a succession of men of Ceylon's parts of India, pre-eminent for piety, and considered as (figuratively) linear descendants, and as the patriarchs or spiritual heads of the sect.

The numerous Buddhist temples, the remains of which are to be seen in a wide extent of country in India, must be considered as national shrines, especially in the regions distinguished from others often found in their immediate neighbourhood, but erected for the purposes of Brahmanical worship. The principal characteristics of temples built for the Buddhists are the dagobas and the images of Buddha. The dagoba is a hemispherical or sometimes pyramidal structure containing some relic of Buddha, which usually stands either within or (as in Ceylon, Siam, &c.) close by a Buddhist temple, and is supported by a pedestal, generally of a cylindrical shape, which varies in height. All images of Buddha are made in a meditative or posture, sometimes standing upright or reclining, but more frequently sitting on a bench, or squatted down with the feet crossed and resting upon the thighs; the forefoot of the right hand sometimes rests on one of the fingers of the left hand, and the left hand is either resting upon the left knee, or the right hand is placed on the lap, being held open, as if to receive an offering. The hair is always curled almost in the fashion of a wig, and the ears are extended and drawn down as if by the weight of some ornament suspended at them. A favourite picture with Dr. Francis Buchanan's seen near a Buddhist temple, apparently intended to afford shelter to pilgrims, or to asetics and priests permanently resident near the sanctuary.

This picture has been found near Benares, at Buddha Gaya in Bengal, at Bag in Malva, near the Ajunta pass, at Ellora, at Nasik, at Juner, at Carli, on Salsette, and at Guntoor. Some have even supposed that ruins of a similar structure, which have been found at Jumna, on the Solon Mountains, and at Manikula in Afghanistan, belong to the same class. Those of Boro Bodo (or Bura broker), in Java, cannot be mistaken, and prove undeniable that Buddhism once prevailed in the very centre of that island. The simultaneous occurrence of the same is evident. According to the traditions preserved in the Mahâvamsa the most celebrated of these places is remarked, and has not yet been satisfactorily accounted for; the most likely mode of solving the problem is, in our opinion, one of the three explanations suggested by Erskine, namely, that this proximity of the two religions is not due to the gradual invasion of Buddhism in that part of the island, but to the introduction of the religion of the Mahâvamsa into the Mahâvamsa region. It is not yet ascertained whether the Mahâvamsa is the work of the Mahâvamsa, or not, and the author of it is not yet determined. The Mahâvamsa ascribed to a Brahmanic author, or to a Brahmanic writer, was known to the Mahâvamsa, or not.

But whilst Buddhism had thus gained ground in Ceylon, and was from thence propagated to the eastern peninsula, it had to endure in India a long-continued persecution, which ultimately had the effect of entirely abolishing it in the country where it had originated. The motive of these persecutions we confess ourselves unable fully to discover. That the caste of the Brahmanas could not without jealousy and alarm witness the progress of a sect which threatened northern Circars), who, being expelled from his father's kingdom, embarked with 700 followers, and landed on Ceylon on the day of Buddha's death; i.e., according to the Cingalese computation, in April, 543 B.C. (See the Epitome of the History of Ceylon, from Pali and Sinhalese records by George Chalmers, Royal Almanack for 1833, p. 224, &c.) But Vijaya himself was not a Buddhist; and although there is a notion of a primate Buddhism in Ceylon previous to the age of the reputed founder of the sect, yet its doctrines were not introduced into the island till the reign of his successor Devanipatissi, who, according to the statements of the Cingalese chronicles, must have reigned from 306 till 266 B.C. Devanipatissi prevailed upon Dharmasuka, an Indian sovereign, who resided at Pattiliputta (Pataliputra?), to send his son Mi- \nNiduddi and his son, who had been instructed in the religion of Anurâdhapura, the capital of Ceylon, for the purpose of introducing the religion of Buddha. They arrived in the first year of Devanipatissi's reign, and propagated the doctrines of Buddha orally. Relics of Buddha were obtained from various quarters, and dagoba was placed in the temple of Buddha, and had the tenets of Buddhism reduced to writing. From this time we may consider Buddhism as completely established in Ceylon. Nearly five centuries subsequent to Walaampabhu, a learned priest named Buddha-gfhâsana, the father of the Mahâvamsa, sent a dagoba to Ceylon to Pugio by a priest named Buddogosaic the date assigned to this occurrence is the year 940 of the Birman era, corresponding to A.D. 397. (Alphabetum Burmanum seu Regni Assamitiae, Ed. Joh. Schiöner, p. 114.) But that the Bhudda still acknowledged the reception of their religion and laws from Ceylon is attested by the curious fact, that in the year 1790, the king of Ava sent at separate times two messengers to Ceylon, to procure copies of their sacred writings; and in 1788, the minister made an official application to the Governor-general of India to protect and assist the person charged with the commission. (Syrmes, Emblisse to Ava, p. 304.) An opinion seems to prevail among the Talapoins or priests of the Bhudda, that the temple of Buddha and the island of Ceylon there are no true and legitimate priests of the laws of Buddha. (Sangermanus, p. 83.) Of many of the sovereigns of Ceylon we find it mentioned that they formed tanks, or built and restored edifices religious in character. The various religious edifices put up by these sovereigns played a conspicuous part in the history of the island, owing to the importance attached to it by the inhabitants. As early as the year 209 of our era we find a schism among the Ceylonese Buddhists mentioned; it originated in the schism of Wirrawadya, a learned priest, who divided the religion of Buddhism into two sects, and between the two sects. Many notions peculiar to the mythology and cosmography of the Brahmans seem at an early period to have been received by the Buddhists, and to have been by them admitted as part of their own belief. This remark is well illustrated by Dr. Francis Buchanan's paper on the Religion and Literature of the Burman's (Aistat. Res. vol. vii. p. 136, &c.), and by many passages in Sangermanus's Description of the Burmese Empire, edited by Dr. Tandy (Rome, 1833), which would, we think, be found in various edifices put up by the priests resident at a temple called the Abagyir vihara. An inquiry was instituted, and the doctrine having been found incorrect, the books in which it was set forth were destroyed. These strong measures did not however in this case destroy the schism; and during a considerable period we find indications of the alternate triumph and oppression of the heretical party. Another heresy, called the Wirawadaya, is stated to have been introduced into Ceylon from the continent of India during the first half of the seventeenth century. But whilst Buddhism had thus gained ground in Ceylon, and was from thence propagated to the eastern peninsula, it had to endure in India a long-continued persecution, which ultimately had the effect of entirely abolishing it in the country where it had originated. The motive of these persecutions we confess ourselves unable fully to discover. That the caste of the Brahmans could not without jealousy and alarm witness the progress of a sect which threatened
The collection of writings regarded as sacred by the Buddhists is probably as voluminous as that of any sect that ever existed: up to the present time however we know little about them. Apart from a few scattered fragments of ancient Buddhist writings which the Baudhāyaṇa sages originally committed their doctrine to writing we believe to have been the Sanskrit, from which they were subsequently translated into the Pali, and into other languages current in the several countries where Buddhism existed. The most important records of the Buddhist sects are contained in the Sanskrit records of Buddhism which have been recently procured in Nepal by Mr. B. H. Hodgson; and it is but natural to suppose, that among them some of the ancient and original treatises on the doctrines of Buddhism should have been preserved. The most noticeable of these rhetorical works is the estimation of the Nepalese Buddhists are nine 'Purāṇas,' also named the nine 'Dharmas,' narrative works, in which elucidations of the Buddhist doctrines seem to be blended with a legendary account of the life of Buddha and the most eminent saints of the sect. Besides these there are works called 'Tantras,' which contain prayers and forms of invocations, and are illustrated by ample commentaries; and also collections of prayers, apparently composed for use on certain occasions, which are called 'Dhāranis.' (See Mr. Hodgson's enumeration of the principal existing Baudhāyaṇa writings of Nepal, in the 16th volume of the Asiatic Researches, p. 422, &c.) Quotations in Sanskrit from a collection of 'Sūtras' or short aphorisms, attributed to Buddha himself, occur in Sanskrit works on the Vedānta philosophy. (Asiatic Researches, 14th vol., p. 177.)

In the Essay on Buddhism by Kitikeyama Dewanmita Unnasse, a native of Ceylon (printed in the Ceylon Almanac for 1835, pp. 211—219), 94,000 sermons preached by Buddha are mentioned (p. 226), which the writer of the essay says are all in the Pali language, and were performed by Buddhist patriarchs there. From China Buddhism was subsequently extended to Corea, A.D. 528, and to Japan, A.D. 552.

About the middle of the fifth century Buddhism seems to have been carried to Java, whether Brahmanical settlers had previously preceded it. It is as yet uncertain whether the Buddhism of Java was of Ceylonese or of Indian origin. According to a tradition current in Java, the strangers, who civilized the island, came from Kaling (i.e. Kalinga, or the northern Ceylon), a name by which the modern Malayas of Java seem to designate the whole continent of India.

The early introduction of Buddhism into Cashmir has already been noticed. According to the local history it continued to flourish there till the reign of Nara, A.D. 295, who was an ardent adherent of the faith, and burned their temples. (Wilson, Asia Res., vol. v. p. 56 and 81.)

Dr. F. Buchanan (Hamilton) is of opinion that the time of the introduction of Buddhism into Nepal may be fixed about the middle of the first century after the Christian era, which was the last great teacher of the Buddhists, passed through the country, and settled at Lassa, where he is supposed to be still alive in the person whom we call the Grand Lama.' (Account of Nepal, p. 10. Compare pp. 32, 56, 196.)

From the Mogul chronicle, published by Schmidt, we learn that the Buddhists were for the first time introduced into Tibet during the reign of Histotitori, in A.D. 407. The great grandchild of that king, Srongdnam Gambo, who ascended the throne in A.D. 629, sent Tongmi Ssamba, attended by priests, into Tibet, and instructed him in the art of writing. Along with an alphabet, which has till the present day preserved its similarity to the Indian Devanagari character (see the plates accompanying Mr. Hodgson's paper in the 16th vol. of the Asiatic Researches), these missionaries seem to have carried the first writings on the religion of Buddha into their native country. But not all the succeeding kings of Tibet were favourable to the new religion. Giang Darno, who reigned from 902—935, as well as his son Gori Shikichi (925—977), were enemies to Buddha, and persecuted its faith. After a period of persecution which lasted 86 years, the doctrine was re-established in Tibet, in the year 988. Nearly three centuries subsequent to this restoration Buddhism was introduced among the Mongols, during the reign of Godan, a prince of the Thibetan line, who reigned A.D. 1247, by Sāyka Pandita, a teacher (Bodhai-sa) who came from the south. (Schmidt's Szamung Seistem, pp. 25, 29, 48, 113, &c., and the notes of the trans. Asia Res., pp. 282, 239, &c.)

1. According to the Swabhāvika school, Swabhāva, a sort of innate faculty, springing from, or rather identical with, Iswara, or God, is the source from which the elements and all things and beings proceed, and into which they are ultimately to be re-absorbed. The universe constantly revolves between Pravitā and Nirvāṇa, and creation and re-
absorption or annihilation; and this eternal change of existence and non-existence is the system and law of nature, without any co-operation of will or design on the part of Iswara. (Hodgson, l. c. p. 297, No. 9.)

The cosmography of the Buddhists divides the entire universe into four principal divisions. The first consists of thirteen Bodhisattva-bhuvanas, or mansions, created by Adi-Buddha, and including the Agnishthha-bhuvana, his abode. The second division of the universe of Buddha will proceed to one of these mansions after death. The third division comprises the second division, which consists of eighteen mansions, called Rūpyavachara-bhuvanas, and created by Brahmadeva; farther down is the third division, comprising the six Kāmavachara-bhuvanas, which, as a whole, overlap the other; and below them are the three Bhuvanas called Ārūpyavachara-bhuvanas, created by Siva, and forming the fourth division. Pious worshippers of Brahmadeva, Vishnu, and Siva will, after death, proceed to these divisions respectively. (Hodgson, Transact. Roy. As. Soc., vol. ii. p. 234.) In these Brahmadeva another series of mansions begins, which belong to Indra, Sūtra (the sun), Chandra (the moon), Agni, Vāyu, &c.

Then follows the earth, with its seven dwipas or continents, separated by seven seas. Below the earth is the 'world of waters,' on which the earth floats as a boat; beyond the 'world of waters' are the seven Patalas or infernal regions, six of which are the abode of the Daityas or malignant spirits, and the seventh, which is divided into eight compartments, is the hell of sinners.

Mr. I. J. Schmidt has translated an extract from a Mongol work, giving an account of the creation (Sannang Setten, p. 302), according to which nonentity or empty space is the original state of everything that exists. The creation of the world is in this account represented as proceeding from the self-contemplation of the Deity, and as effected in the 'region of the first Dhyāna' (or the divine will and agency?), which comprises the abodes of Brahmadeva, Vishnu, and Siva. A wind arises in this region, which, by blowing the abode of the very highest beings, the 'region of the bliss of the order of spiritual beings;' so that the abode of the entire order of spiritual beings, and in the same manner a succession of abodes of spirits gradually inferior is formed, until the winds reach the lowest region of empty space, and there produce a condensation of air which becomes the germ of the material worlds, and abodes of men, with the exception only of the 'region of the second Dhyāna,' are subject to alternate production and dissolution.

Along with many other mythological conceptions the Buddhists seem to have borrowed from the Brahmanists their doctrine of the four yugas, or periods of time, now called a Kāla or the duration of one existence of the world is divided. These yugas they distinguish by the gradual decreasing length of men's lives in them. In the first yuga of the present Kāla men lived 8,000 years; in the second, 6,000 years; in the third, 4,000 years; and in the fourth, 2,000 years; and in a similar manner. The cause of the creation of the world, says its followers, is Yatena, i.e. an effort or a determined will on the part of the Creator. In the same manner in the affairs of this world all difficulties are overcome by Yatena; and the kind of World-knowledge which is necessary to the liberation of the soul from matter depends on (Yatena) a conscious intellectual effort. (Hodgson, l. c. p. 305.)

Various terms are in use to denote the state of final liberation of the soul, which is by all those sects proposed as the object to which man should aspire; but the expression, which Baudhāya seems to be particularly fond of employing, is Nirvāna. This word is properly a passive participle of the Sanskrit root 비 (bhave), which means 'to blow,' as the preposition 비, 'out from,' prefixed to it; and its primary idea is to blow out, which it is said is the word used in the ancient Veda; and hence 'departed, defunct;' but the word is likewise used with the preposition 비 taken in a negative sense, and it then signifies 'calm, unruffled,' or employed as a substantive, 'calmness, tranquillity;' whence is derived its use as a description of the happy state of imperishable serenity and apathy at which the soul arrives on its reunion with the Divine Essence.

The popular belief in Nepal attributes the superintendence of the work of creation especially to Padmapani, one of the four presiding deities of the Dharmakāya, who is from a sacred book, from having produced the three Hindu deities Brahma, Vishnu, and Siva, and as having assigned to them respectively the tasks of Creation, Preservation, and Destruction. It is Brahma therefore who, according to this account, created the line of Tīrthankaras and is said to have been the appointed architect of the world, while Padmapani, by Adi-Buddha's special command, created all animate things.
cessive Lamas is strikingly illustrated by a passage in a letter addressed in 1774 by the Lama of Teshoo Loombo to the governor-general in India, in which he applied for the privilege of growing hemp, that it will be used as a motive for his request, "that although in the different periods of his reivivness he had chosen many regions for the places of his birth, yet Bengal was the only country in which he had been born twice, for which reason he had a preference for it beyond any other." (Turner's Embassy to Tibet, pref. p. xv.)

The Buddhists reject entirely the authority of the Vedas, and the religious observances, sacrifices, and ceremonies which are prescribed in them and kept by the Hindus. They have no distinction of any castes. The priests are chosen from all classes of men; they are obliged to live in celibacy, but may resign their sacerdotal character, if they desire it, and are then permitted to marry. In Ceylon three orders of priests are distinguished: those of the highest order (who seem to be the only ones in dispute, state that the leaf of the palm-tree, and Knox mentions that they are permitted in Ceylon to wear this screen 'with the broad end over their heads foremost, which none but the king docs.' In Ceylon they wear a yellow coat, gathered together above the waist, and hanging over their shoulders, and girded about with a belt of fine packthread. In the appendix to Symes's Embassy to Ava there is an account of the ceremonies used in the Birman empire at the consecration of a Buddhist priest: the candidate is reminded of four principal commandments which he must observe, to wit, to sacrifice purity, to commit murder, not to steal, and not to practise sorcery, or to disgrace the priestly character by covetousness; and he must promise that he will procure his maintenance by preaching and begging; that he will dwell in houses of a certain description, and that he will endeavour to turn to some use things thrown aside as useless by others, or to discover the medicinal powers of plants not previously employed. Buddhist priests are not forbidden the use of animals; but if a bullock be slain for its own use, it is to be given to the priest. Convents for priests as well as nunnaries exist in all countries where Buddhism has been introduced. Their processes and their forms of religious worship are described as being attended with much pomp and splendour, and intended to impress the multitude with its majesty. The first Christian missionaries that proceeded to Tibet were surprised to find there, in the heart of Asia, monasteries, processions, festivals, a pontifical court, and several other ecclesiastical institutions resembling those that are in the Catholic church, and many were induced by these similarities to consider Lamaism as a sort of degenerated Christianity. It should however be remembered that at the time when Buddhism was introduced into Tibet, Nestorian Christians had ecclesiastical settlements in Tibet, and Italian and Syrian messengers who were invited to the court of the Khans carried church ornaments and altars with them, and celebrated their worship in the presence of the Tartar princes; and that an Italian archbishop sent by Clement V. established his see at Karakorum, and ordains the sect in which divinities were worshiped with all the ceremonies usual in Europe. It is by no means improbable that the Lamas, whose court then began to assume a splendid exterior, should have adopted some of the forms of the Catholic service as they saw it conducted in their own country. Tenants, also, have co-operated in producing a similar mode in conducting the divine worship in two religions essentially foreign to each other.

Concerning the details of the ecclesiastical establishments of the Buddhists, we must refer our readers to the articles giving an account of the several countries into which Buddhism has been introduced, such as China, Japan, Ceylon, Tibet, &c.

BUDDING, an operation in horticulture, by means of which the branches of one kind are often made to grow upon the stem of another kind. It is stated in the article Bud, that this organ has the power of growing when separated from the mother-plant. Not only will it grow, but it will increase in size. It is therefore said to be a motive for its use, and in fact a motive for its propagation by eyes [Exs]; the latter only is technically named budding.

Budding is usually executed thus:—With a very sharp knife a fully formed bud, and the leaf to which it is axillary, are pared off the branch, along with about half an inch of bark adhering to them at the upper end, and an inch and a half at the lower end. By holding the leaf firmly between the finger and thumb of the left hand, with the wounded side of the paring uppermost, the operator is able to disengage from the bark the small slip of wood which adheres to it, and by a jerk to snap it off the paring, leaving nothing but the cellular centre of the bud adhering to the bark. This done, he makes in the branch to be operated on, one incision transversely through its bark, and another longitudinal at right angles to the first, just far enough towards the base, so that the two together resemble the figure of the letter T. He then, with a flat ivory blade, lifts up the bark on each side of the longitudinal incision, so as to separate it from the wood, and inserts beneath it the prepared bud. Care must be taken to keep out the air, which in hothouses is kept down by a cover placed a little below the transverse line. This done, a ligature of bass is carried round the stem so as to bind the bud firmly to the new wood on which it is placed. If the operation is well performed, the bud will thus be fixed on a new plant in the same relative position as when it occupied the branch from which it was taken; the mouths of the medullary rays of its bark will unite with those of the wood of the stranger plant, it will be kept in contact with a continual supply of food oozing out of the alburnum on which it is placed, it will shortly be supplied with all that is necessary for its development. Then when the growing season arrives it will be stimulated by light and warmth to attract sap from the new wood to which it adheres, it will push forth new wood of its own over that upon which it touches, and thus will form as a new plant. Budding is thus a very advantageous kind of propagation, with its parent plant. In order to enable the latter to do this, it is customary to head down budded branches to within a few inches of the buds, so as to compel the sap which oozes from the roots to expend itself upon the former; a few natural or forced buds from the parental branch are also left to attract the sap to their neighbourhood, and are then destroyed; when the stranger bud has pushed to the length of a few inches, it is tied to the stem so as to be secured from being broken off by accident; and finally, when it is quite secure, that small portion of the stem of the parent which had been left above the bud in the first instance is cut away, and the branches produced by the bud become the head of the new tree.

Budding is the generic nature of budding, but like all other operations can only be well performed after some experience. It may be varied within certain limits, and there are in fact a few other modes, such as reversed budding and scallop-budding, which are occasionally practised (see Scallop, and Engæl of Horticulture, new edit. p. 656); but that here described is the most common and the best. Roses, plums, peaches, nectarines, cherries, and many other plants are chiefly propagated thus, and there is no theoretical reason why it should not be extended to all similar species, if it is occasionally found impracticable, as in heaths, in which, owing to specific causes which vary in different instances.

Budding is usually performed in the months of July and August, because at that season the bark separates freely from the wood, and the young buds are fully formed; but whenever the two latter conditions can be satisfied, the operation may take place equally well.

It must however be observed, that the bud of one plant can only be made to grow upon the wood of another when both bud and stock are nearly related botanically.
Thus roses will bud upon roses, but not upon currants, as is vulgarly supposed; apples will bud upon pears or thorns; pears upon medlars or quinces, and apricots upon plums, because all these species are closely related; but an apple will not bud upon a plum or a peach, because, although they are allied to a certain degree, yet their consanguinity is not sufficiently strong.

BUDGE, GUILLAUME, or, as he is better known by the Latinized name, Budusius, was born in Paris in 1467, of an ancient and honourable family. His early education appears to have been neglected, and when he went to Brussels to study the civil law he profited little, owing to his very imperfect knowledge of Latin.

Indulgence and a love of amusement consumed much of the remainder of his youth, till he was suddenly inspired with so ardent a love of letters that he entered a monastery in the house of the Benedictines of the holy chapter of St. Thomas, and under the direction of Father Martin d'Avezac, learned to read and write Latin, and in the chase, music, and dancing.

Budusius, as we have observed, went a hunting, but was not a good sportsman. His propensities were rather towards the study of letters, and he was destined to become one of the most learned men of his time. He was a great lover of books, and was always to be found in the company of some learned man, or in some library, or in some society of philosophers.

He was a man of great activity, and was always engaged in some work of importance. He was a great writer, and was the author of many works, which were printed and published.

In 1536, he published a work on the history of the Council of Trent, and in 1539 he published a work on the history of the Council of Constance.

His works were read and studied by all the learned men of his time. He was a great favorite with the Emperor Charles V., and was appointed his privy councillor.

He was a great friend of the Emperor, and was always ready to do anything for him.

He was a great man of affairs, and was always ready to do anything for his country.

BUDWEIS, the southernmost city in Bohemia, bounded on the E. and S. by the archduchy of Austria, and at one point in the S.W. by Bavaria. It is the highest land in Bohemia, and is only about one hour's journey from the Moldau, which has an area of about 1617 sq. m., is watered by the Moldau, and its tributaries the Malech and Luschnits, and contained, in 1817, 170,670 inh., but at present about 204,500. The forests are extensive, and produce much timber. Cattle, and especially sheep, are fed in great numbers; the soil is fertile, and much grain is raised; and the mountains yield iron, coal, and other minerals. The manufactures consist of glass, woolens, paper, iron, ware, cotton, &c.

Budweis enjoys the advantage of a canal, called the Schwartenberg Canal, which has been constructed, and which connects the Moldau and the Lusatia, and contains eight towns, among which are Budweis; Krumau, a mining and manufacturing town, with 4400 inh.; and Wittingau, 2800 inh.; 25 market vill., and 897 other vill. and cities.

BUDWEIS, the capital of the circle, is situated close to the confluence of the Moldau and the Malsec, and bears, in Schlovonic, the name of 'Cesky-Budweisovice.' It is a well and regularly built town, includes three suburbs, is the seat of a bishopric instituted in 1793, and has a population of 15,000. It is a centre of commerce, and is the seat of a university, and the headquarters of the philosophical academy, a diocesan and theological seminary, between 740 and 750 houses, and a pop. of about 7500 souls.

The markets for horses and grain are important; the manufactures consist of glass, woolens, paper, &c.

Budweis is a town of considerable importance, being the seat of a bishopric, and is the centre of commerce and manufactures for the whole of Bohemia.
BUENOS AIRES. [LA PLATA.]

BUENOS AIRES, the capital of the republic La Plata (Provincias Unidas del Rio de la Plata), in South America, is in 34° 36' 29" S. lat., 58° 16' 11" W. long., on the S. bank of the upper part of the wide estuary of the La Plata river, about 150 m. from the place where it enters the sea. The estuary is about 20 m. wide, so that Colonia, a small place on the opposite bank, is only visible from the more elevated places in the town, and then only in very clear weather. Though the estuary has a considerable depth in the middle, it grows so shallow towards its S. bank that large vessels are obliged to remain in the outer roads from 7 to 9 m. from the shore; small vessels enter the inner roads, called belizzy, where they are still 2 m. from the town. The beach itself is extremely shallow; even boats cannot approach nearer than 50 yards or a quarter of a mile, according to the state of the tide, and persons as well as goods are landed in rudely constructed carts drawn by oxen. When it blows fresh, the surf on the beach is very heavy, and often causes loss of life.

A pier which was constructed in the time of the Spanish government is nearly useless, except at very high tides.

The city stands on a high bank for about 2 m. along the river. Between the city and the water's edge is a space of considerable width, rarely covered by the tides, on which some trees are planted. To the E. of the pier, at a distance of a few miles, there is a noble forest of pine-trees, which extend to the water's edge, and are mounted with cannon. It is of little importance in a military point of view; at present it has no garrison, and the buildings are appropriated to public offices, and the residence of the president of the province.

About a mile lower down the high bank suddenly turns inland, leaving a vast level plain along the shore, traversed by a little stream, which makes a good harbour for small craft, its mouth forming a kind of circular basin.

Buena Esperanza is a picturesque little place, which occupies a considerable space: it is divided into two parts by a long and low edifice, which serves as a kind of bazaar, and has a corridor along the whole length of each side, which is used as a shelter for the market people. The space between this bazaar and the fort is appropriated to the market, where all kinds of provisions, especially excellent fruits, are sold; but there are no stalls, and the goods are spread on the ground. The opposite side, which is much larger, is a kind of place d'armes, and contains a very fine edifice, called the cabildo or town-house, in which the courts of justice hold their sessions, and the city council or cabildo meets. Near the centre of the square is a neat pyramid erected in commemoration of the Revolution, by which the country was freed from the dominion of the vassals who assembled from different parts of the empire, representing Justice, Science, Liberty, and America: the whole is inclosed with a railing.

The streets are at regular intervals, and are open at right angles to the river, with a rather steep ascent from the shore. They are straight and regular; a few of them near the piazzas are paved, but the greater part are unpaved. In the rainy season they are a slough of mud, and in the dry season the dust in them is still more insupportable. Most of them have footpaths, but they are narrow and insufficient.

In the neighbourhood of the piazza there are many houses of two stories, but towards the outskirts the houses have only one story. They are built of brick, have flat roofs, and are white-washed. Towards the street they have commonly two windows, which have seldom glass panes, and are generally protected by a reja or iron railing, which gives the houses the appearance of a prison. In the middle of this outer wall is a gateway, the rooms on each side of which are generally occupied as places of business, or as markets; a small gateway or door of the garden is entered, which is surrounded on three sides by buildings, the wall of the adjoining house making up the fourth. The building at the back of the court is usually the dining-room; that on the left or the right is the sitting-room or parlour. The walls is usually paved with brick, or sometimes with black and white marble, tesselated.

In the better part of houses canvas awning is spread from the roof over the veranda to protect against the excessive heat of the sun. Grape vines are planted round the walls. The houses have as little wood as possible about them, both the first and second floors having brick pavements. There are no chimneys except in the kitchens, and no fire-places, so that the rooms are never warm enough to render fire-places necessary in the rooms.

There are fifteen churches, of which the principal are the cathedral, which of itself covers almost a whole square, San Domingo, San Merced, San Francisco, and the Recoleta; they are all large and handsome buildings, but of a somewhat gloomy aspect. In the time of the Spaniards these churches were ornamented with a profusion of gold and silver, but the revolutionary wars have drained them of their wealth.

The majority of the inhabitants are the descendants of Spaniards, who have settled in that country during the last three centuries. The number of free negroes or slaves is small; that of native Indians is much greater: they compose the greater part of the lower classes, and speak only Spanish, having entirely forgotten the language of their ancestors. The whole pop. of the town is estimated by some at only 40,000, but by others at 60,000 and upwards.

No other town of South America has so many institutions for the promotion of science. The university, which was founded much later than that of Buenos Ayres, possesses a library of about 20,000 volumes. There is also a collection of objects of natural history, an observatory, a separate school of mathematics, a public school, and a school for painting and drawing. Since the Revolution there has been also established a literary society for the promotion of natural philosophy and the mathematicians, an academy of medicine, and another of jurisprudence, a normal school for mutual instruction, a patriotic union for the promotion of agriculture, besides some charitable societies. A considerable number of newspapers is published in the town. [For the commerce of Buenos Ayres see LA PLATA.]

The town was founded by the Spaniards in 1535, but in 1539 being obliged by the neighbouring Indians to abandon it, they retired to Assumption, on the Paraguay. When the Spaniards were firmly settled in the country they rebuilt the town in 1550, and since that time it always has been increasing, though slowly. The climate is healthy, as its name Buenos Ayres (good air) implies, an appellation which was bestowed on it by its founder Mendonza.

(Taken from Travels of Brockenridge, by Croker and Haigh; and the Historical, Political, and Statistical Account of the United Provinces of La Plata.)

BUFFALO. [Ox.]

BUFFALO is a populous town of Erie county, State of New York, situated near the right bank of the Niagara river, by which the waters of Erie are discharged into Ontario: in 42° 54' N. lat., and 78° 55' W. long., and 296 m. W. of Albany. Buffalo stands on ground somewhat elevated, and is surrounded on three sides by a fine alluvial plain. Its growth has been very rapid. The pop., in 1810, was only 1508; it had increased, in 1820, to 2093; in 1825 it contained 5140, and in 1830, the latest enumeration, 8653 inh. This increase may be attributed to the circumstance of the canal from Albany, or the Hudson river, to Lake Erie, having its termination at this spot. This canal, which was commenced in 1817, and finished in 1825, is 363 m. long, with a surface width of 40 ft. it has 84 locks. The cost of its construction was 210,075 dollars, and its utility may be estimated from the fact, that in 1831, the amount of tolls collected exceeded a million of dollars.

The number of travellers passing through Buffalo is at all times very great; it forms the port whence persons going to the northern part of the western states first embark upon the lakes, and the port by which they are attended by the British in 1813, and so entirely destroyed by fire, that only one house escaped. The town was soon restored, and building of all kinds is now (1836) rapidly increasing. Provisions are so cheap that the charge made to boarders, at the first hotel in the place, is only 24 dollars per week.

END OF VOLUME THE FIFTH.

WILLIAM CLAYTON and Son, Stamford, Connecticut.
